# Guidelines

Online messages (also known as *solicited messages*) result from less severe conditions than system error messages, they can originate from online processes, and they are not normally accompanied by dumps or a system shutdown. Like system error messages, online messages occur under TPF control.

The severity of the error determines whether a message is an online message or a system error. See *Messages (System Error and Offline)* for more information about system error messages.

## Online Message Formats

When you see an online message on your screen or read it in a dump, you will notice that the message has one of the following formats.

| Format | Description |
|---|---|
| *ppppnnnnx hh.mm.ss text* | Message with the standard message ID. |
| *text* | Message without the standard message ID and with ***text only***. |
| *xx,yy text* | Message without the standard message ID that begins with ***variable text***. |

## Standard Messages

Messages with the standard message ID have the following format.

*ppppnnnnx hh.mm.ss text*

When reading from left to right, this format contains the following parts.

| Part | Description |
|---|---|
| *ppppnnnnx* | The standard message ID has the following parts: |
| *pppp* | Represents the first 4 characters of the segment name or the secondary action code of the associated input message. |
| *nnnn* | Represents a unique message number. |
| *x* | Represents one of the following severity codes: |
| **I** | Information only, which indicates the message is a normal response. |
| **A** | Action required, which indicates that additional operator action is required. |
| **W** | Attention, which indicates an error that could require additional user action. |
| **E** | Error, which indicates an error without program shutdown. |
| **T** | Termination, which indicates an error with program shutdown. |
| *hh.mm.ss* | Time stamp represents the time that the message was built. When you search for a message, ignore the time stamp because it is not shown in this information. |
| *text* | The text of the message. |

## Non-Standard Messages

Messages without the standard message ID are shown with the following formats.

- *ttttttttt xx,yy text* or *ttttttttt text*

  When reading from left to right, these messages contain the following parts:

| Part | Description |
|---|---|
| *ttttttttt* | The nonstandard message ID that is used for publication purposes only and is represented in this information |

© Copyright IBM Corp. 2002

| | | |
|---|---|---|
| | | as 000000000. This message ID ***is not coded with the message text***. |
| | *xx,yy* | Represents the variable information in the text of the message. |
| | *text* | The text of the message. |

## Locate an Online Message

There are two ways to locate an online message depending on whether the message does or does not have the standard message ID.

If a message has the standard message ID, the message IDs are listed in increasing numeric order preceded by their alphabetic prefix. To find a message with the standard message ID, record the message ID from the message (for example, ALMT0002E) and then use the message ID to search for the message.

If a message does not have the standard message ID, the message is listed in one of the following ways:

- With a message ID of 000000000 and then presented in alphabetic order based on the initial message text or the initial message text that follows the variable information; usually the first or second word in the message text.
- Severity code (I, 2, 3, or S) that follows the first asterisk (*).

## Analyze an Online Message

Once you locate the message, you will notice that the message ID and the message text are framed in a box for quick access. In the message text, variable information is shown in *italicized* lowercase letters. When a message actually occurs, specific information is provided for the variable information in the message that is displayed on your screen or printed in the dump. Explanations of the variable information are described immediately following the message text or in the actual explanation of the message.

Below each message you will find the following pieces of information to help you analyze the message.

- **Explanation**

  Provides a brief description of the error conditions and the reason why an error occurred. A description of any variable information that is included in the message text may also be included in this explanation. f there is no explanation necessary, the word None is shown.
- **System Action**

  Indicates the action taken by the TPF system as a result of the error and provides an explanation indicating the results of the error. If there is no system action taken or the possibilities are too variable, the word None is shown.
- **User Response**

  Provides suggestions for a user action to correct the problem. Bulleted lists and numbered lists may be used to present this information to you. A *bulleted list* is used to present several different actions you can perform to resolve the problem. These actions are ordered from the least severe to the most severe. A *numbered list* is used whenever a procedure must be followed in sequential order to resolve a problem. In addition, cross-references to other messages or other publications for additional information may be provided if applicable. If there is no user response necessary, the word None is shown. The user responses are ***suggestions***. Any action should be cleared with your system support personnel first.

## Standard Message Example

The following shows an example of how an online message ***with*** a standard message ID and its associated information is presented.

---

**ALMT0002E TO CPUID *b* NOT IN OR ABOVE CRAS STATE**

**Where:**

*b* The CPU ID.

**Explanation:** The TO CPU ID is not in or above the computer room agent set (CRAS) state. XLMT is not active below the CRAS state and must be active before this function is allowed.

**System Action:** Processing is ended.

**User Response:** Do the following:

1. Cycle the TO CPU ID to a state that allows this processing to complete.
2. Enter the ZALMT command again.

See *TPF Operations* for more information about the ZALMT command.

## Non-Standard Message Example

The following shows an example of how an online message ***with text only*** and its associated information is presented.

**000000000 ADDR NOT FOUND**

**Explanation:** The 3705 address that was supplied was not found in the network control program (NCP) polling table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNPOL commands.

# Online Messages

## ACLV–ACPL

**ACLV0005E HEX CHAR FOUND FOR DEC VALUE**

**Explanation:** A number was indicated as a hexadecimal with multiple hexadecimal indicators or a hexadecimal digit was found in a number that does not have the hexadecimal indicator.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACLV command.

**ACLV0006E NO PARAMETERS ENTERED ON ZACLV MESSAGE**

**Explanation:** No keywords or parameters were specified when the ZACLV command was entered.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACLV command.

**ACLV0007E TOO MANY PARAMETERS IN ZACLV MESSAGE**

**Explanation:** Too many parameters were specified when entering the ZACLV command.

**System Action:** None.

**User Response:** Enter the ZACLV command again and specify the correct number of parameters.

See *TPF Operations* for more information about the ZACLV command.

**ACLV0011E NO PARAMETERS ENTERED**

**Explanation:** No keyword parameters were specified on the ZACLV command that was entered.

**System Action:** The message is ignored.

**User Response:** Enter the ZACLV command again and specify a valid keyword parameter and value.

See *TPF Operations* for more information about the ZACLV command.

**ACLV0012E INVALID VALUE ENTERED**

**Explanation:** The keyword value specified when entering the ZACLV command is either equal to zero or greater than 32767.

**System Action:** The message is ignored.

**User Response:** Enter the ZACLV command again and specify a value greater than zero and less than 32768.

See *TPF Operations*for more information about the ZACLV command.

**ACLV0013E CTKA RETRIEVAL ERROR-MESSAGE IGNORED**

**Explanation:** The CVMN program is unable to retrieve keypoint A through the CYYM program.

**System Action:** The message is ignored.

**User Response:** If a system error dump accompanies the message, have your system programmer review the dump to determine the cause of the error and to correct it. Keypoint A may need to be loaded again.

See *TPF Operations* for more information about the ZACLV command.

**ACOR0010I BEGIN DISPLAY**

**Explanation:** This is the normal response to the ZACOR command. A display that contains two lines of pre-alteration values and two lines of the post-alteration values follows this message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACOR command.

**ACPD0011I SYSTEM DATA LOAD STARTED**

**Explanation:** The TPF system data load started.

**System Action:** None.

**User Response:** None.

**ACPE0001I SUMMARY OF ERRORS DURING DATA LOAD *xxxxx* FACE ERROR(S) ENCOUNTERED *yyyyy* RECORD CODE ERROR(S) ENCOUNTERED *ttttt* RECORD FILE ERROR(S) ENCOUNTERED END OF ERROR SUMMARY**

**Where:**

*xxxxx*
The file address compute program (FACE) error that was found.

*yyyyy*
The record code error that was found.

*ttttt*
The record file error that was found.

**Explanation:** This message is issued at the completion of a load during which one of the following errors occurred:

- A FACE input ID or ordinal number that is not valid
- A code that is not valid in the record header

© Copyright IBM Corp. 2002

- A record file error. This message displays the total number found for each error type. Counts are only displayed in the summary for the errors that occurred.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPF0011E FACE INPUT NOT VALID FACE ID** *faceid* **ORDINAL** *ordnum* **HEADER** *hdrchar hdrhex* **RECORDS READ** *recread* **RECORDS WRITTEN** *recwrite*

**Where:**

*faceid*
The file address compute (FACE) program ID.

*ordnum*
The ordinal number.

*hdrchar*
The first 12 bytes of the header record, formatted as text.

*hdrhex*
The first 12 bytes of the header record, in hexadecimal.

*recread*
The number of records that were read.

*recwrite*
The number of records that were written.

**Explanation:** An error from the file address compute (FACE) program indicated an attempt to load a record type that is not valid or a record with an ordinal number that is not valid.

**Note:** A threshold is set for this message to prevent the TPF system from running out of main storage blocks when loading a tape with defective records. The TPF system issues a maximum of 12 error messages. A summary message that indicates the total count of FACE errors is issued at the end of the load.

**System Action:** The record is not filed and an attempt is made to print the first 12 bytes of the header record (mapped by the SDFPF data macro).

**User Response:** Do the following:

1. Correct the error.
2. Run the job again.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0000I ONLINE MODULES NOW BEING LOADED**

**Explanation:** This is a normal message issued when the online modules are being loaded.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0001I SYSTEM LOAD COMPLETE LOAD DATA AFTER 1052 STATE IF NEEDED IF NOT IPL PRIME MODULE** *ccud*

**Where:**

*ccud*
The prime module address unless the prime module is offline. If the prime module is offline, then *ccud* is the duplicate module device address.

**Explanation:** This message is issued by the general file loader (ALDR) after the online modules are loaded successfully. This message reminds the operator to perform a data load, if it is required, after the TPF system is in 1052 state. If a data load is not necessary, the next step is an online module initial program load (IPL).

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0002I IMAGE ONE ENABLED**

**Explanation:** This message is issued at the completion of a load if image one was enabled during the load.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0003I CONTROL PROGRAM LOADED**

**Explanation:** The control program (CP) was loaded successfully into the core image restart area (CIMR).

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0004I DUPE MODULE IS OFFLINE** *nnn*

**Where:**

*nnn*
The symbolic module number.

**Explanation:** During online general file loader (ACPL) processing, the file status table information indicated that the module referenced in the message was offline.

**System Action:** The TPF system issues this message after the ACPL0052E message is issued. ACPL processing is continued with the next module.

**User Response:** None.

---

**ACPL0006I FILE RESIDENT PROGRAMS LOADED PROGRAMS READ-** *xxxxx* **PROGRAMS FILED-** *yyyyy*

**Where:**

*xxxxx*
The number of programs read.

*yyyyy*
The number programs filed.

**Explanation:** The file resident programs were loaded successfully.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0007I KEYPOINT LOAD COMPLETE**

**Explanation:** The keypoints were loaded successfully onto the online prime and prime duplicate modules.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0008I ICDF LOADED**

**Explanation:** The in-core dump formatter (ICDF) was loaded successfully into the core image restart area (CIMR).

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0009I ACPL LOADED**

**Explanation:** The online general file loader (ACPL) segment was loaded successfully into the core image restart area (CIMR).

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0010I IPLB LOADED**

**Explanation:** The initial program load (IPL) program B (IPLB) was loaded successfully into IPL area 1.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0013I FCTB LOADED**

**Explanation:** The file address compute program (FACE) table (FCTB) was loaded successfully into the core image restart area (CIMR).

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0014I RIAT LOADED**

**Explanation:** The record ID attribute table (RIAT) was loaded successfully into the core image restart area (CIMR).

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0016I IPLA LOADED**

**Explanation:** The initial program load (IPL) program A (IPLA) was loaded successfully into IPL area 1.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0017I USR1 LOADED**

**Explanation:** The user-defined core image restart area (CIMR) component (USR1) was loaded successfully into the CIMR.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0018I USR2 LOADED**

**Explanation:** The user-defined core image restart area (CIMR) component (USR2) was loaded successfully into the CIMR.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0019I CTKX LOADED**

**Explanation:** CTKX was loaded successfully.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0020E LOADER CONTROL RECORD INVALID RELOAD GENERAL FILE**

**Explanation:** The general file loader (ALDR) offline segment set a switch in the Loader Control record that indicated that an error occurred.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0021E ERROR READING CONTROL RECORD LOAD ABORTED**

**Explanation:** A read error occurred while accessing the Loader Control record that contains the loader control information.

**System Action:** The load ends abnormally.

**User Response:** Run the general file loader (ALDR) again to replace the loader control record.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0022E LOAD ABORTED — ERROR READING ICR FILE ADDRESS IS** *mmmmccccchhhhrr*

**Where:**

*mmmmccccchhhhrr*
The module, cylinder, head, and record address.

**Explanation:** A read error occurred while accessing the Image Control Record (ICR).

**System Action:** The load ends abnormally.

**User Response:** To cause ACPL to write a new image control record (ICR), run an general file loader (ALDR), and include a LOADER IMAGE CLEAR card (and all the components required by that card) in the load deck. Note that this will cause all online image information to be cleared.

See *TPF System Installation Support Reference* for more information about multiple TPF images and the LOADER IMAGE CLEAR card.

---

**ACPL0023E CYL NUMBER FOR LGF DEVICE HAS BEEN EXCEEDED FILE ADDRESS IS** *mmmmccccchhhhrr* **LOAD ABORTED**

**Where:**

*mmmmccccchhhhrr*
The module, cylinder, head, and record address.

**Explanation:** The end of the loader general file (LGF) was found prematurely while reading either E-type programs or records for a core image restart area (CIMR) component from the LGF. The LGF either was not built correctly by ALDR, or it was corrupted.

**System Action:** The load ends abnormally.

**User Response:** Do the following:

1. Review the steps used to create the LGF that was IPLed.
2. Create the LGF again.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0024E LOAD ABORTED — IMAGE ONE DEFINITION INVALID**

**Explanation:** The general file loader requires that image one is defined to use initial program load (IPL) area 1 and program area 1. Because the loader image clear card was not specified, image one could not be initialized and it is defined with an IPL area or program area other than one.

**System Action:** The load ends abnormally.

**User Response:** Run the load again and specify a loader image clear card.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0025E ERROR DURING LOAD OF CONTROL PROGRAM**

**Explanation:** A read error while loading prevented the complete load of this startup segment into the core image restart area (CIMR). This error is flagged in a message to the prime computer room agent set (CRAS) console.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0026E ERROR —** *comp* **EXCEEDS ALLOCATED SIZE**

**Where:**

*comp*
Core image restart area (CIMR) component or the IPL component.

**Explanation:** The specified component was requested to be loaded but there is insufficient space allocated in CTKX for the component.

**System Action:** The load ends abnormally.

**User Response:** Run the load again and specify a smaller version of the specified component or load a new version of CTKX to allocate additional space for the component. Note that loading a new version of CTKX may require that additional components be loaded.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0027E ERROR DURING LOAD OF IPLA**

**Explanation:** A read error while loading prevented the complete load of this startup segment.

**System Action:** The load continues.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0028E ERROR DURING LOAD OF USR1**

**Explanation:** A read error while loading prevented the complete load of this startup segment into the core image restart area (CIMR).

**System Action:** The load continues.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0029E ERROR DURING LOAD OF USR2**

**Explanation:** A read error while loading prevented the complete load of this startup segment into the core image restart area (CIMR).

**System Action:** The load continues.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0030E LOAD ABORTED — NO PRIMARY IMAGE**

**Explanation:** The Image Control record (ICR) does not have an image marked as primary.

**System Action:** The load is aborted.

**User Response:** Do one of the following:

- Enter the ZIMAG PRIMARY command on the online TPF system.
- Run the load again, specifying the loader image clear card.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0032E ERROR DURING LOAD OF ACPL**

**Explanation:** A read error while loading prevented the complete load of this startup segment into the core image restart area (CIMR) on the prime module. This error is flagged in a message to the prime computer room agent set (CRAS) console.

**System Action:** The load continues.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0034E ERROR DURING LOAD OF IPLB**

**Explanation:** A read error while loading prevented the complete load of this startup segment into the IPL area. This error is flagged in a message to the prime computer room agent set (CRAS) console.

**System Action:** The load continues.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0036E ERROR DURING LOAD OF SIGT**

**Explanation:** A read error while loading prevented the complete load of this startup segment into the core image restart area (CIMR) on the prime module. This error is flagged in a message to the prime computer room agent set (CRAS) console.

**System Action:** The load continues.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0040E ERROR DURING LOAD OF FCTB**

**Explanation:** A read error while loading prevents the complete load of this startup segment into the core image restart area (CIMR) on the prime module. This error is flagged in a message to the prime computer room agent set (CRAS) console.

**System Action:** The load continues.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0042E INSUFFICIENT RESTART AREA ALLOCATED LOAD ABORTED**

**Explanation:** The restart area is not large enough to contain the programs specified in the loader control record.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0045E ERROR READING KEYPOINT PATCH FILE ADDRESS IS** *mmmmccccchhhhrr*

**Where:**

*mmmmccccchhhhrr*
Module, cylinder, head, and record address.

**Explanation:** The patches cannot be applied. The keypoint on the online module is not modified. These errors are flagged in a message to the prime computer room agent set (CRAS) console.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0046E ERROR READING KEYPOINT TO LOAD FILE ADDRESS IS** *mmmmccccchhhhrr*

**Where:**

*mmmmccccchhhhrr*
Module, cylinder, head, and record address.

**Explanation:** A read error occurred when accessing a new

library keypoint from the general file. The keypoint on the online module is not overwritten. These errors are flagged in a message to the prime computer room agent set (CRAS) console.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0050E ERROR DURING LOAD OF ICDF**

**Explanation:** A read error while loading prevented the complete load of this startup segment into the core image restart area (CIMR) on the prime module. This error is flagged in a message to the prime computer room agent set (CRAS) console.

**System Action:** The load continues.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0051E ACPL INCORRECTLY ENTERED — NO SS IPLD FROM GF LOAD ABORTED**

**Explanation:** The online general file loader (ACPL) was entered when no subsystem was IPLed from the loader general files.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0054E ERROR READING VOL LABEL FROM ONLINE MODULE *mmm* (*ccud*)**

**Where:**

*mmm*
The basic subsystem (BSS) online module symbolic module number.

*ccud*
The basic subsystem (BSS) online module device unit address.

**Explanation:** The online general file loader (ACPL) reads each basic subsystem (BSS) online module volume label prior to initializing cylinder 0 track 0 with a format write operation.

This message is written to the prime computer room agent set (CRAS) console when a BSS online module volume label was not read due to input/output (I/O) errors. These errors are flagged in a message to the prime CRAS.

ACPL bypasses the initialization operation for the device and proceeds to the next BSS online module.

The error condition should be analyzed based on prior error messages sent to the operator from the TPF I/O supervisor. The failed BSS online module should be considered as non-IPLable. If the module is a prime or prime duplicate module, the corrective actions should be taken. The volume label may be rewritten to the volume by ICKDSF through non-buffered storage control. (ICKDSF cannot access a volume through the airline buffered storage control.)

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0055E ERROR WRITING IPL RECORDS TO ONLINE MODULE *mmm* (*ccud*)**

**Where:**

*mmm*
The basic subsystem (BSS) online module symbolic module number.

*ccud*
The basic subsystem (BSS) online module device unit address.

**Explanation:** The online general file loader (ACPL) detected an input/output (I/O) error while writing record 1, 2, 3, 4, or 5 on the basic subsystem (BSS) online module.

| Record | Description |
|---|---|
| **Record 1** | The TPF bootstrap record 1. |
| **Record 2** | The TPF bootstrap record 2. |
| **Record 3** | The volume label. |
| **Records 4 and 5** | The IPLA program records. |

These errors are flagged in a message to the prime computer room agent set (CRAS) console.

ACPL bypasses the initialization on the BSS online module and continues to the next module. The error condition should be analyzed.

If the error can be erased by initializing the volume again, ICKDSF should be run to write volume record 3 or a new volume should be created.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0056E SYSTEM LOAD COMPLETED WITH ERRORS CHECK CONSOLE TO DETERMINE WHICH SS ABORTED IPL INCLUDING ABORTED SS MAY NOT BE POSSIBLE**

**Explanation:** There were problems loading one or more of the subsystems (check the previous online general file loader (ACPL) console messages ). Nevertheless, an attempt will be made to continue the initial program load (IPL). These errors are flagged in a message to the prime computer room agent set (CRAS) console.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0057E IPLB MAY ONLY BE LOADED IN THE BSS**

**Explanation:** This startup segment may only be loaded in the basic subsystem (BSS). This error is flagged in a message to the prime computer room agent set (CRAS) console.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0058E CONTROL PROGRAM MAY ONLY BE LOADED IN THE BSS**

**Explanation:** This startup segment may only be loaded in the basic subsystem (BSS). This error is flagged in a message to the prime computer room agent set (CRAS) console.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0059E ICDF MAY ONLY BE LOADED IN THE BSS**

**Explanation:** This startup segment may only be loaded in the basic subsystem (BSS). This error is flagged in a message to the prime computer room agent set (CRAS) console.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0061E ACPL MAY ONLY BE LOADED IN THE BSS**

**Explanation:** This startup segment may only be loaded in the basic subsystem (BSS). This error is flagged in a message to the prime computer room agent set (CRAS) console.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0063E LOAD ABORTED — ERROR FILING ICR FILE ADDRESS IS** *mmmmccccchhhhrr*

**Where:**

*mmmmccccchhhhrr*
The module, cylinder, head, and record address.

**Explanation:** A write error occurred while writing the Image Control record (ICR).

**System Action:** The load is ended.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0064E BSS ABORTED RESTART TERMINATED**

**Explanation:** ACPL found a terminal error while trying to load the basic subsystem (BSS).

**System Action:** The initial program load (IPL) is ended.

**User Response:** Check the previous online general file loader (ACPL) messages to determine the cause of the error.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0067E ERROR DURING LOAD OF RIAT**

**Explanation:** A read error while loading prevented the complete load of this startup segment into the core image restart area (CIMR). This error is flagged in a message to the prime computer room agent set (CRAS) console.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0071E ERROR READING/FILING TO PRIME AND PRIME DUP ACPL ABORTED**

**Explanation:** The online general file loader (ACPL) cannot find or file a record to either the prime or the prime duplicate modules.

**System Action:** The load is ended.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0074E ERROR READING RESTART RECORD FROM GEN. FILE FILE ADDRESS IS** *mmmmccccchhhhrr*

**Where:**

*mmmmccccchhhhrr*
The module, cylinder, head, and record address.

**Explanation:** The online general file loader (ACPL) cannot read a core image restart record (CIMR) record from the general file loader (ALDR).

**System Action:** The CIMR load routine for that restart item type is aborted. The load tries to continue with those restart type items that remain loaded.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

### ACPL0079E LOAD ABORTED — IMAGE CLEAR CARD REQUIRED

**Explanation:** This message follows one or more address mismatch error messages.

**System Action:** The load is aborted.

**User Response:** Do the following:

1. Review the preceding error messages to determine the cause of the error.
2. Correct the error.

See *TPF System Installation Support Reference* for more information about loaders.

### ACPL0080E ERROR READING CTKX FROM GEN. FILE FILE ADDRESS IS *mmmmccchhhhrr*

**Where:**

*mmmmccchhhhrr*
The module, cylinder, head, and record address.

**Explanation:** A read error occurred while accessing the Image Pointer record (CTKX) from the loader general file (ALDR

**System Action:** The load is aborted.

**User Response:** Load a new CTKX by using the ALDR.

See *TPF System Installation Support Reference* for more information about loaders.

### ACPL0081E LOAD ABORTED — IMAGE IS EMPTY *comp* MUST BE LOADED

**Where:**

*comp*
The required component that was missing from the load.

**Explanation:** The Image Control record (ICR) indicates that image one is empty, therefore all core image restart area (CIMR) components — IPLA, IPLB, and CTKX — must be loaded (if required by the subsystem).

**System Action:** The load is aborted.

**User Response:** Run the load again and specify all required components in the load deck.

See *TPF System Installation Support Reference* for more information about loaders.

### ACPL0082E CIMR ADDRESS MISMATCH ERROR

**Explanation:** The address saved in the Image Control record (ICR) for the core image restart area (CIMR) does not match the address obtained online from FACS.

**System Action:** The load is aborted.

**User Response:** Run the load again and specify the loader image clear card in the load deck.

See *TPF System Installation Support Reference* for more information about loaders.

### ACPL0083E KEYPT ADDRESS MISMATCH ERROR

**Explanation:** The address saved in the Image Control record (ICR) for the KEYPT area does not match the address obtained online from FACS.

**System Action:** The load is aborted.

**User Response:** Run the load again and specify the loader image clear card in the load deck.

See *TPF System Installation Support Reference* for more information about loaders.

### ACPL0084E CTKX ADDRESS MISMATCH ERROR

**Explanation:** The CTKX address saved in the Image Control record (ICR) does not match the address obtained online from FACS.

**System Action:** The load is aborted.

**User Response:** Run the load again and specify the loader image clear card in the load deck.

See *TPF System Installation Support Reference* for more information about loaders.

### ACPL0085E IPL ADDRESS MISMATCH ERROR

**Explanation:** The address saved in the Image Control record (ICR) for the initial program load (IPL) area does not match the address obtained online from FACS.

**System Action:** The load is aborted.

**User Response:** Run the load again and specify the loader image clear card in the load deck.

See *TPF System Installation Support Reference* for more information about loaders.

### ACPL0086E LOAD INCOMPLETE — *comp* MUST BE LOADED

**Where:**

*comp*
Name of the core image restart area (CIMR) or initial program load (IPL) component that must be loaded.

**Explanation:** One or more CIMR or IPL components must be loaded for any of the following reasons:

- The image clear card was present in the load deck.
- CTKX was loaded and:
  - The start ordinal of the specified component changed
  - The start ordinal of the next component decreased, leaving insufficient space for the specified component.

**System Action:** The load is aborted.

**User Response:** Run the load again including the specified components.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0087E LOAD ABORTED — FACS ERROR ERROR CALCULATING *xxxxxxx* ORDINAL *yyyy***

**Where:**

*xxxxxxx*
The record type.

*yyyy*
The record ordinal.

**Explanation:** FACS was unable to calculate a file address reference format (FARF) address for the specified record type and ordinal.

**System Action:** The load is aborted.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0088E LOAD ABORTED — ERROR CONVERTING FARF ADDRESS**

**Explanation:** An error occurred while converting a file address reference format (FARF) address to MCHR format.

**System Action:** The load is aborted.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0090E START ORDINAL HAS CHANGED IN CTKX *comp* MUST BE LOADED**

**Where:**

*comp*
Name of the core image restart area (CIMR) component that must be loaded.

**Explanation:** This message is issued when CTKX is loaded and the start ordinals of one or more core image restart area (CIMR) components are different from the online CTKX.

**System Action:** The load is aborted.

**User Response:** Run the load again including the specified component.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0091E START ORDINAL OF *xxxx* HAS CHANGED IN CTKX *yyyy* MUST BE LOADED**

**Where:**

*xxxx*
Name of the core image restart area (CIMR) component whose ordinal changed.

*yyyy*
Name of CIMR component that must be loaded.

**Explanation:** This message is issued when CTKX is loaded and the start ordinals of one or more CIMR components are different from the online CTKX.

**System Action:** The load is aborted.

**User Response:** Run the load again including the specified component.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0092E LOAD ABORTED — FIND ERROR ON *xxxxxxx* ORD *yyyy***

**Where:**

*xxxxxxx*
The record type.

*yyyy*
The record ordinal.

**Explanation:** A read error occurred while trying to find the specified record type and ordinal.

**System Action:** The load is aborted.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0093E LOAD ABORTED — CTK6 FIND/FILE ERROR**

**Explanation:** An error occurred while trying to find or file CTK6.

**System Action:** The load is aborted.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**ACPL0094E LOAD ABORTED — TIMESTAMP MISMATCH DETECTED BETWEEN LGF IPAT AND ONLINE IPAT*vv***

**Where:**

*vv* The version of the online program allocation table (PAT).

**Explanation:** The time stamp in the PAT on the loader general file (LGF) differs from the time stamp in the online PAT.

**System Action:** The load request is ended.

**User Response:** Ensure that you loaded the correct version of the PAT.

See *TPF System Installation Support Reference* for more information about the loader general file.

**ACPL0095E FACE ERROR ENCOUNTERED MOVING PROGRAM VERSIONS ONLINE**

**Explanation:** A file address compute program (FACE) error occurred while moving the program version records from the loader general file (LGF) to the online program version record (PVR).

**System Action:** The load request continues. However, no other attempts are made to update the program version records (PVRs).

**User Response:** Do one of the following to replace the program version records:

- Use the general file loader (ALDR) to load the E-type programs again, and perform an initial program load (IPL) for the loader general file.
- Perform an IPL by using a different image so that image 1 can be disabled. Use the auxiliary loader to load all the E-type programs to image 1 and then perform another IPL by using image 1.

See *TPF System Installation Support Reference* for more information about the general file loader and the auxiliary loader.

---

**ACPL0096E ERROR READING PVR FROM GENERAL FILE FILE ADDRESS IS** *mmmmcccchhhhrr*

**Where:**

*mmmmcccchhhhrr*
The file address of the program version record (PVR) on the loader general file (LGF).

**Explanation:** An error occurred while reading a program version record (PVR) from the loader general file (LGF).

**System Action:** The load process continues. However, no other attempts are made to update the program version records (PVRs).

**User Response:** Do one of the following to replace the program version records:

- Use the general file loader (ALDR) to load the E-type programs again, and perform an initial program load (IPL) for the loader general file.
- Perform an IPL by using a different image so that image 1 can be disabled. Use the auxiliary loader to load all the E-type programs to image 1 and then perform another IPL by using image 1.

See *TPF System Installation Support Reference* for more information about the general file loader and the auxiliary loader.

---

**ACPL0097W THE NUMBER OF EXTRA PROGRAM RECORDS AVAILABLE IS** *recnum* **AND BELOW THE THRESHOLD VALUE OF** *threshold*

**Where:**

*recnum*
The number of available records.

*threshold*
The threshold value.

**Explanation:** The number of available extra program records has fallen below the threshold value.

**System Action:** The TPF system issues this message to the prime computer room agent set (CRAS) console and the receive-only (RO) console.

**User Response:** Do one of the following:

- Allocate more #XPRGn records.
- Load all your ISO-C programs again and include the LOADER PROG-MOD-BASE CLEAR card in the load deck to recover any lost #XPRGn records.

See *TPF System Installation Support Reference* for more information about the LOADER PROG-MOD-BASE CLEAR load deck card.

---

**ACPL0098E LOAD ABORTED — NO EXTRA PROGRAM RECORDS AVAILABLE**

**Explanation:** There are no available #XPRGn records. Therefore, at least one program was not be loaded.

**System Action:** The load process is ended.

**User Response:** Load a new FACE table that defines a greater number of #XPRGn records.

---

**ACPL0099E LIBRARY** *xxxx* **CANNOT BE LOADED TO NON-BSS SUBSYSTEM**

**Where:**

*xxxx*
The name of the library.

**Explanation:** C language libraries only exist in the BSS subsystem. An attempt was made to load a C language library to a subsystem other than the BSS.

**System Action:** The library is not loaded to the subsystem. The load continues.

**User Response:** Remove the C language library from the load deck for the subsystem. If the library needs to be loaded, include it in a load deck for the BSS.

---

**ACPL0100E ERROR CALCULATING ONLINE ADDRESS OF PROGRAM** *xxxx* **LOAD ABORTED**

**Where:**

*xxxx*
The name of the program.

**Explanation:** An error occurred when the online general file loader (ACPL) tried to read a general file program directory record. Not all file-resident programs were loaded. These errors are flagged in a message to the prime computer room agent set (CRAS).

**System Action:** The load ends.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0101E ERROR READING PROGRAM RECORD FROM THE LGF FILE ADDRESS IS** *mmmmcccchhhhrr* **LOAD ABORTED**

**Where:**

*mmmmcccchhhhrr*
Module, cylinder, head, and record address.

**Explanation:** The file-resident program whose allocated address is given in the appended console message cannot be loaded. These errors are flagged in a message to the prime

computer room agent set (CRAS).

**System Action:** The load ends.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0102E UNABLE TO FIND *xxxx* ENTRY IN THE PAT LOAD ABORTED**

**Where:**

*xxxx*
The name of the program.

**Explanation:** The online general file loader (ACPL) cannot find the program entry in the program allocation table (PAT).

**System Action:** The load ends.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0103E NAME IN PGM BLOCK — *xxxx* — DOES NOT MATCH NAME IN PAT — LOAD ABORTED**

**Where:**

*xxxx*
The name of the program.

**Explanation:** The online general file loader (ACPL) found a mismatch in the program name in the program block and the name in the program allocation table (PAT).

**System Action:** The load ends.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**ACPL0104E LOADING *cccc vv* FOR PROCESSOR *nn* KEYPOINT CONTROL RECORDS NOT CONVERTED FOR 32-WAY LOOSELY COUPLED LOAD ABORTED**

**Where:**

*cccc*
The keypoint being loaded.

*vv* The version of the keypoint being loaded.

*nn* The decimal processor ordinal for the keypoint being loaded.

**Explanation:** While loading keypoints, the online general file loader (ACPL) detected a keypoint for processor ordinals 8 – 31. The keypoint control records have not been converted to 32-way loosely coupled format and only support processor ordinals 0 – 7. An attempt to file the keypoint control records that are not in 32-way loosely coupled format would result in a loss of keypoint status.

**System Action:** The keypoint load for the subsystem ends.

**User Response:** Remove the keypoints for processor ordinals 8 – 31 from the keypoint load until you have entered the ZMIGR command to convert the keypoint control records.

See *TPF Operations* for more information about the ZMIGR command.

---

**ACPL0105W KEYPOINT POINTER RECORD INITIALIZED**

**Explanation:** During the TPF system IPL using the loader general file (LGF), the #KEYPT keypoint pointer record is uninitialized or corrupted.

**System Action:** A new keypoint pointer record is generated by ACPL and filed to the online TPF system. The TPF system load continues normally.

**User Response:** If this is the initial TPF system IPL using LGF, no action is necessary. Otherwise, do the following:

1. Determine the cause of the keypoint control record corruption.
2. Correct the problem.
3. IPL the TPF system again.

---

**ACPL0106E KEYPOINT ORDINAL MAPPING ERROR - *cccc vv* PROCESSOR *nn* ORDINAL *ooooo***

**Where:**

*cccc*
The keypoint being loaded.

*vv* The version of the keypoint being loaded.

*nn* The decimal processor ordinal for the keypoint being loaded.

*ooooo*
The decimal keypoint ordinal that could not be mapped.

**Explanation:** The online general file loader (ACPL) was unable to map the specified ordinal for the specified keypoint and processor to a file address compute (FACE) program ordinal in the #KEYPT keypoint pointer record.

**System Action:** The TPF system load ends.

**User Response:** Do the following:

1. Determine the cause of the problem by evaluating the following:
   - Check if there are enough #KEYPT ordinals allocated in the FACE table (FCTB).
   - Check if the #KEYPT keypoint pointer record has been corrupted.
   - Check if the specified ordinal is correct for the specified keypoint and processor. If it is not correct, CTKX has been corrupted.
2. Correct the problem.
3. Load the TPF system again.

---

**ACPL0107W KEYPOINT POINTER RECORD DETECTED KEYPOINT EXTENT MAP REPLACED**

**Explanation:** During the IPL of a TPF system using the loader general file (LGF), ACPL determined that the keypoint pointer record on file does not match the current definition of the #KEYPT fixed file record type in the FACE table (FCTB).

**System Action:** The extent map in the keypoint pointer

record is replaced to match the current definition of the #KEYPT fixed file record type in the FCTB. The system load continues normally.

**User Response:** If the definition of the #KEYPT fixed file record type was a planned change, no action is necessary. Otherwise, do the following:

1. Determine the cause of the keypoint extent table mismatch.
2. Correct the problem.
3. ReIPL the TPF system.

# ACRS–APAT

**ACRS0000I COMPLETE**

**Explanation:** This is the normal response to the ZACRS command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0001E INVALID FUNCTION CODE**

**Explanation:** The function code is not valid. The function code must be one of the following:
- REP
- DEL
- FBK
- CHG.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0002E INVALID DESTINATION SET**

**Explanation:** When the FBK function code is specified in the ZACRS command, the destination must be PRC or RO.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0003E INVALID LNIATA**

**Explanation:** The line number, interchange address, and terminal address (LNIATA) may not be valid for any of the following reasons:
- The LNIATA is not defined in the WGTA table (refer to WG0TA)
- The data input does not match the data in the CRAS status table entry for the specified LNIATA (refer to CR0AT)
- There is a syntax error in the input LNIATA.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0004E INVALID KEYWORD**

**Explanation:** The ZACRS message editor was unable to recognize a keyword. This may be because the dash (-) was omitted between the keyword and its parameter.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0005E INVALID TERMINAL TYPE**

**Explanation:** The terminal type is not valid. The terminal type must be any of the following:
- CON
- TYP
- PRT
- CRT.

The terminal type may not be valid for any of the following reasons:
- Data in the CRAS status table entry does not match the input
- There is a syntax error in the TYPE keyword.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0006E INVALID CPU ID**

**Explanation:** An incorrect central processing unit ID (CPU ID) was specified.

**System Action:** None.

**User Response:** Specify a valid CPU ID, which must be:
- A single character from A—Z or 0—9
- Defined in the WGTA table.

See *TPF Operations* for more information about the ZACRS command.

**ACRS0007E INVALID REST CODE**

**Explanation:** The REST code must be valid as defined in the RTCEQ macro.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0008E INVALID RTCD CODE**

**Explanation:** The RTCD code must be valid as defined in the RTCEQ macro.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0009E INVALID FUNCTION FOR REST KEYWORD – USE "CHG" FUNCTION**

**Explanation:** The REST keyword is only valid with the CHG function and must be entered against a previously defined CRAS status table entry.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0010E INVALID FUNCTION FOR RTCD KEYWORD – USE "CHG" FUNCTION**

**Explanation:** The RTCD keyword is only valid with the CHG function and must be entered against a previously defined CRAS status table entry.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Logic* and *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0011E OPT KEYWORD INVALID FOR THIS FUNCTION**

**Explanation:** The OPT keyword is not valid. This keyword is only valid with the FBK and CHG functions. The OPT-VAL keyword is performed only when the line is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0012E PRT KEYWORD INVALID**

**Explanation:** The PRT keyword is not valid. This keyword must define a valid Axx slot (01 through 99), which contains a printer. The PRT keyword is allowed only with the REP function to associate a printer with a CRT.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0013E INVALID OPT PARAMETER**

**Explanation:** The OPT parameter is not valid. It is only allowed with the FBK and CHG functions:

- For the CHG function, the OPT keyword must be ADD or DEL.
- For the FBK function, the OPT keyword must be VAL.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0014E DUPLICATE KEYWORD**

**Explanation:** A specific keyword was specified more than once.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0015E TERMINAL TYPE MISSING**

**Explanation:** The terminal type is missing. The TYPE keyword is required for the ZACRS command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0016E CPU ID MISSING**

**Explanation:** The central processing unit (CPU) ID is missing. The CPUID keyword is required for the ZACRS command.

**System Action:** None.

**User Response:** Specify a valid CPU ID. The CPU ID must be a single character from A to Z or 0 to 9.

See *TPF Operations* for more information about the ZACRS command. Also see *TPF Database Reference* for more information.

**ACRS0017E ALT ENTRY IN CRAT INVALID**

**Explanation:** An error was found trying to retrieve the XLMT Assembly Area (XS0AA) record for a specific terminal while trying a queue swing or TYPE-CON, -TYP, or -PRT was specified for a terminal that is not defined with hard copy capability.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS

command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0018E LMT ERROR**

**Explanation:** When attempting to retrieve the XLMA record for the prime CRAS to swing the prime CRAS LMT queue from one device to another, an error was received trying to retrieve the XLMA record.

**System Action:** The application program exits without successfully having swung the prime CRAS LMT queue from the old device to the new device.

**User Response:** See your system programmer to determine the problem with the XLMA record.

**ACRS0019E CANNOT "REP" PRC HARD COPY DEVICE**

**Explanation:** Except for the native console system (NCS) devices, the RO printer cannot be replaced without also replacing the corresponding prime computer room agent set (CRAS) console.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0020E INVALID CPUID FOR THIS FUNCTION**

**Explanation:** When you were modifying one of the alternate consoles in the CRAS status table by issuing the ZACRS command, the CPU ID specified did not match the CPU ID assigned to the alternate console.

**System Action:** The application program issues this error message and exits without performing the modification to the alternate console.

**User Response:** Do the following:

1. Enter the ZDCRS command to view the CPU ID for the alternate console to verify you are specifying the correct CPU ID.
2. Enter the ZACRS command again specifying the correct CPU ID.

See *TPF Operations* for more information about the ZACRS and ZDCRS commands.

**ACRS0021E NO ASSOCIATED PRINTER ASSIGNED FOR REPLACEMENT CRT**

**Explanation:** When replacing the prime computer room agent set (CRAS) console with a CRT device, there must be an associated printer assigned to the CRT device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0022E REST KEYWORD NOT ALLOWED ON A PRINTER**

**Explanation:** Restricting of commands is only allowed for input devices.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0023E LINE/SNA SESSION NOT ACTIVE**

**Explanation:** For non-SNA devices, the line status table indicates that the device is not valid or has stopped.

For SNA devices, no session exists for the particular device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0024E LNIATA/CPUID NOT IN CRAT**

**Explanation:** The line number, interchange address, and terminal address (LNIATA) or the central processing unit ID (CPU ID) in the specified Axx entry does not match the LNIATA or CPUID input.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0025E THIS COMMAND MUST BE ENTERED FROM THE EP PROCESSOR**

**Explanation:** The ZACRS command with the CHG parameter and ADD option specified was entered in a loosely coupled environment. However, the ZACRS command with CHG and ADD specified is valid only on an EP processor.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZACRS command directly on an EP processor.
- Rout the ZACRS command to an EP processor.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about CRAS support.

**ACRS0026E "FBK" INVALID – PRC NOT A 1052**

**Explanation:** An FBK function was attempted and the prime computer room agent set (CRAS) console was not in 1052 state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about CRAS support.

**ACRS0027I ALT 1052 VALIDATED**

**Explanation:** The line status table entry for the alternate 1052 state was set to indicate that the device is valid and started.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) console support.

**ACRS0028E NO ALT 1052 AVAILABLE**

**Explanation:** An FBK function was attempted to the alternate 1052 state but no valid alternate device was found.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) console support.

**ACRS0029T UNABLE TO RETRIEVE KEYPT C — ABORTED**

**Explanation:** The function was not performed due to a problem trying to retrieve or file keypoint record C.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) console support.

**ACRS0030E DEL FUNCTION INVALID FOR FSC TERMINAL — USE "CHG" FUNCTION**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) console support.

**ACRS0031E DEL FUNCTION INVALID FOR RESTRICTED TERMINAL — USE "CHG" FUNCTION**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) console support.

**ACRS0032E PRT KEYWORD VALID ONLY FOR "REP" FUNCTION**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) console support.

**ACRS0033E RTCD ALLOWED ON PRINTERS ONLY/3270 CRTS ONLY**

**Explanation:** Routing codes are only allowed for functional support console (FSC) devices. By definition, FSC devices are printers or 3270 CRTs.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) console support.

**ACRS0034E ALT TERMINAL ALREADY EXISTS**

**Explanation:** An attempt was made to define a device in an Axx slot already defined for another (or the same) device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) console support.

**ACRS0035E 1052 DEV TYPE INVALID WITH 3270 NATIVE CONSOLE SUPPORT**

**Explanation:** The use of 1052 and 3270 native console system (NCS) for the prime computer room agent set (CRAS) console or receive-only console is mutually exclusive.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) console support.

**ACRS0036I CRAT SLOT ALREADY EMPTY**

**Explanation:** A delete was attempted to an empty CRAS status table slot.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) console support.

**ACRS0037E INVALID ASSOCIATED PRINTER SLOT IN CRAT**

**Explanation:** The printer slot referenced through the REP function is empty.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) console support.

**ACRS0038E CRT OR PRINTER NOT LOGGED TO LOCAL APPLICATION**

**Explanation:** This message pertains to SNA devices. The device that is being defined must be logged to an application local to that central processing unit (CPU).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0039E FBK ONLY VALID FROM NATIVE CONSOLE (010000) (USE REP FUNCTION)**

**Explanation:** An attempt was made to use the FBK function on the prime computer room agent set (CRAS) console device or receive-only console in the native console system (NCS) environment from a line number, interchange address, and terminal address (LNIATA) other than 010000 or 000000.

The FBK function is used to replace the subchannel address used by the 010000 or 000000 line numbers. Use the REP function when dealing with any other line number.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0040E SUB KEYWORD MUST BE VALID HEX SUBCHANNEL ADDRESS**

**Explanation:** The SUB keyword must reflect a valid 3270 subchannel attached to channel zero (a 3-digit hexadecimal field).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0041E SUB KEYWORD NOT ALLOWED FOR 1052 FALLBACK**

**Explanation:** The SUB keyword is allowed in only the native console system (NCS) environment.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0042E RO FALLBACK NOT ALLOWED FOR 1052**

**Explanation:** The FBK function is permitted only for the 1052 prime computer room agent set (CRAS) console. However, since the prime CRAS console and the receive-only (RO) device are on the same physical device, falling back the prime CRAS console will also cause the receive-only console to fall back.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0043E NO CONSOLE CRT AVAILABLE FOR PRC**

**Explanation:** An attempt was made to use the FBK function on the prime computer room agent set (CRAS) console in the native console system (NCS) environment when no valid alternate console device was available in keypoint record C.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0044I CONSOLE ALTERED – THIS IS NOW PRC**

**Explanation:** The FBK function was successful. This message displays on the newly selected prime computer room agent set (CRAS) console.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0045W CONSOLE ALTERED, *xxxx* SUB CHANNEL *nnn* IS NOW THE PRIME CRAS**

**Where:**

*xxxx*
The console type (1052 or 3270).

*nnn*
The subchannel address (hexadecimal).

**Explanation:** This message is displayed when when the prime computer room agent set (CRAS) console is manually fallen back to an alternate (ALT) or fallback console.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0047I THE REQUESTED 3270 LOCAL CRAS TERMINAL HAS BEEN VALIDATED**

**Explanation:** This indicates that the line status table entry for the requested console device was set to valid and started and the specified line number, interchange address, and terminal address (LNIATA) (000000 and 010000) is available for use.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0048E THE INPUT SUBCHANNEL IS NOT AVAILABLE**

**Explanation:** The subchannel specified on the SUB parameter was not one of the specified alternates.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0049E THE INPUT SUBCHANNEL IS CURRENTLY IN USE**

**Explanation:** The subchannel input on the SUB parameter is currently in use as a local 3270 (or other) device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0050E INPUT LNIATA NOT CURRENTLY DEFINED FOR THIS FSC**

**Explanation:** The RTCD or REST requested is not currently associated with the line number, interchange address, and terminal address (LNIATA).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0051E DEL FUNCTION NOT ALLOWED FOR DEVICE CURRENTLY BEING USED FOR PRC OR RO CRAS.**

**Explanation:** An attempt was made to perform a DEL function for a device currently being used for either the prime computer room agent set (CRAS) console or the receive-only (RO) console.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0052E LNIATA 000000 IS CURRENTLY DEFINED AS THE RO CRAS. USE "FBK" TO REPLACE IT**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0053E LNIATA 01000 IS CURRENTLY DEFINED AS THE PRIME CRAS. USE "FBK" TO REPLACE IT**

**Explanation:** An attempt was made to REP to either the prime computer room agent set (CRAS) console for the receive-only (RO) console by using the line number, interchange address, and terminal address (LNIATA) 000000 or 010000, respectively, and it was already defined that way.

**System Action:** None.

**User Response:** Use the FBK function.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0054E NO CONSOLE PRINTER AVAILABLE FOR RO**

**Explanation:** The receive-only (RO) device is disabled and no valid alternate device is available from either the alternate slots in CTKC or the CRAS status table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0055E RECOUP/QSWING CURRENTLY PROCESSING XLMA RECORDS, FUNCTION NOT PERFORMED**

**Explanation:** A function requiring a queue swing was entered either while recoup was chasing the XLMA queue or while another ZACRS function was being performed against the queue.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZACRS

command. See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**ACRS0056E RO NOT INPUT DEVICE — INVALID FOR REST KEYWORD**

**Explanation:** The Restriction function is valid only for input devices.

**System Action:** None.

**User Response:** None.

**ACRS0057E CANNOT CHANGE PRC/RO FSC ROUTINE — INVALID FOR RTCD KEYWORD**

**Explanation:** Although the prime computer room agent set (CRAS) console and the receive-only (RO) consoles have a RTCD value associated with them in RTCEQ, their FCS assignments may not be altered.

**System Action:** None.

**User Response:** None.

**ACRS0058E THE RTCD OR REST PARM MUST BE ENTERED FOR CHG**

**Explanation:** The CHG function must have a corresponding REST or RTCD keyword specified with it.

**System Action:** None.

**User Response:** None.

**ACRS0059I CHG/FBK OCCURRED BUT QUEUE NOT SWUNG — GFS NOT ACTIVE**

**Explanation:** A function requiring a queue swing was requested before GFS was active. The function was performed but the queue was not swung.

**System Action:** None.

**User Response:** None.

**ACRS0060E ALTERNATE 1052 MUST BE VALIDATED**

**Explanation:** A request was made to fall back the prime computer room agent set (CRAS) console to the alternate 1052 console, which was not valid. Before switching to the alternate CRAS console, it must be validated by using the OPT-VAL parameter of the ZACRS command.

**System Action:** None.

**User Response:** None.

**ACRS0061E REQUESTED CRT LOGGED TO AN APPLICATION OTHER THAN SMP.**

**Explanation:** A request was made to assign a 3270 local CRT as a functional support console (FSC). The request could not be completed while the requested CRT is logged to an application other than the system message processor (SMP).

**System Action:** None.

**User Response:** None.

**ACRS0062E THE DEVICE ON THE INPUT LINE IS NOT AVAILABLE.**

**Explanation:** When entering the ZACRS command with the OPT-VAL option, an attempt is made to validate the input line and to mount the device whose symbolic device address is in the corresponding entry in the line status table. The device could not be mounted and therefore the line is not validated.

**System Action:** None.

**User Response:** Do one of the following:
- Correct the device problem and enter the ZACRS OPT-VAL message again
- Enter the ZADCA(ZACOR) command to alter the line status table with the symbolic device address of an operational console and enter the ZACRS OPT-VAL message again.

**ACRS0063E ALT 1052 DEVICE IS UNAVAILABLE OR INCORRECTLY CONFIGURED**

**Explanation:** A ZACRS FBK PRC OPT-VAL command is entered and a message cannot be successfully sent to the alternate 1052. The device may be:
- Powered off
- Configured incorrectly
- Unavailable for some reason.

**System Action:** None.

**User Response:** Do the following:
1. Determine whether the alternate 1052 is powered off or whether the configuration is correct.
2. Take the appropriate action before entering the command again.

**ACRS0064I THIS IS THE ALTERNATE PRIME CRAS FOR SYSTEM ID *enterprise.complex cpuid* ON PROCESSOR *num* MODEL *mod* LOW CPU ADDRESS *addr***

**Where:**

*enterprise*
The name of your enterprise or operations center.

*complex*
The name of your loosely coupled complex or stand-alone TPF system.

*cpuid*
The CPU identifier of the TPF system.

*num*
The two-character version code with the six-character CPU serial number.

*mod*
The CPU model number, for example, 3090.

*addr*
The lowest CPU address of the processor or processor partition on which the TPF system is running.

**Explanation:** A ZACRS FBK PRC OPT-VAL command was specified for the 1052 prime computer room agent set (CRAS) console. This message is sent to the 1052 alternate prime CRAS console to verify that this device should be the new prime CRAS console once fallback completes. This message

also identifies the TPF system with which the new prime CRAS console is associated.

**System Action:** None.

**User Response:** Verify that the device this message displays on is the 1052 alternate CRAS console to which you want to fall back.

See *TPF Operations* for more information about the ZACRS command and the CNAL listing.

---

**ADCA0010I BEGIN DISPLAY**

**Explanation:** This is the normal response to the ZADCA command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZADCA command and for an example of the informational display.

---

**AFIL0011I DISPLAY OF FILE ADDRESS** *fileaddr*

**Where:**

*fileaddr*
The 16-digit hexadecimal file address.

**Explanation:** This is the normal response to the ZAFIL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAFIL command and for an example of the informational display.

---

**AGFL0000E INVALID MESSAGE FORMAT**

**Explanation:** The message format is not valid for one of the following reasons:

- A blank does not follow the action code.
- Too many blanks precede the data set numbers.
- Too many blanks precede the device address.
- An end-of-message (EOM) character does not follow the device address.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAGFL command.

---

**AGFL0004E INVALID DEVICE ADDRESS**

**Explanation:** Characters that are not valid were found in the device address.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAGFL command.

---

**AGFL0009E I/O ERROR ON DEVICE** *addr*

**Explanation:** An error occurred during one of the following operations:

- Performing a FNSPC macro for the original label
- Filing the new label.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAGFL command.

---

**AGFL0023I ALTERATION COMPLETE**

**Explanation:** This is the second message issued when the ZAGFL command has completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAGFL command.

---

**AGFL0024I GENERAL FILE DATA SETS** *xx-xx-xx* **ARE ON DEVICE** *addr*, **SUBSYSTEM** *ssid*

**Where:**

*xx* The general file data sets (GDSs).

*addr*
The device address.

*ssid* The subsystem ID.

**Explanation:** This is the first message issued when the ZAGFL command has completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAGFL command.

---

**AGFL0025E DEVICE** *addr* **NOT USABLE**

**Where:**

*addr*
The device address.

**Explanation:** The device specified does not correspond to a general file module.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAGFL command.

---

**AGFL0026I INVALID CHARACTERS IN LABEL ON DEVICE** *addr*

**Where:**

*addr*
The device address.

**Explanation:** The existing label on the device is not in EBCDIC format. The valid range of characters is:
- A through F
- 0 through 9.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAGFL command.

---

**AI** *xx* **LINE NOT IDLE**

**Where:**

*xx* The symbolic line number.

**Explanation:** The line is stopped but is not command free.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

---

**ALCT ILLEGAL LINE NO.**

**Explanation:** Either the input symbolic line number is not a valid hexadecimal number or the symbolic line number is out of range of the valid symbolic line numbers.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**ALCT ILLEGAL PATH**

**Explanation:** The path number is either greater than the maximum path number or it is not a valid hexadecimal number.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**ALCT INVALID FORMAT**

**Explanation:** The format specified for the ZALCT commands is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command and the correct format to use.

---

**ALCT INVALID REQUEST**

**Explanation:** The requested action code is not valid. Valid options are:
- ACT
- DWN.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command

---

**ALCT LN** *xx zz* **INACTIVE RECORD**

**Explanation:** Either bit 0 of SCKIND is zero or the 6 bytes of data for the path are all zero.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**ALCT LN** *xx zz* **AL OFF OK**

**Explanation:** This is the normal response to the ZALCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**ALCT LN** *xx zz* **AL ON OK**

**Explanation:** This is the normal response to the ZALCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**ALCT LN** *xx zz* **OFF OK**

**Explanation:** This is the normal response to the ZALCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**ALCT LN** *xx zz* **ON OK**

**Explanation:** This is the normal response to the ZALCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**ALCT LN** *xx zz* **RETRIEVAL ERROR**

**Explanation:** There was an error while retrieving the SCK record.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**ALCT LN *xx zz* WAS OFF**

**Explanation:** This is the normal response to the ZALCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**ALCT LN *xx zz* WAS ON**

**Explanation:** This is the normal response to the ZALCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**ALMT0001I CPU *a* NEF LMT QUEUE ACQUIRED BY CPU *b***

**Where:**

*a* The CPU ID.

*b* The CPU ID.

**Explanation:** This is the normal response to the ZALMT command.

**System Action:** The ownership and transmission responsibility for the XLMT queue was transferred from CPU A to CPU B.

**User Response:** None.

See *TPF Operations* for more information about the ZALMT command.

---

**ALMT0001E FROM CPUID *a* IS AN INVALID ID**

**Where:**

*a* The CPU ID.

**Explanation:** The FROM CPU ID specified in the input message is not valid for this complex.

**System Action:** Processing is ended.

**User Response:** Enter the request again with a valid CPU ID.

See *TPF Operations* for more information about the ZALMT command.

---

**ALMT0002E TO CPUID *b* NOT IN OR ABOVE CRAS STATE**

**Where:**

*b* The CPU ID.

**Explanation:** The TO CPU ID is not in or above the computer room agent set (CRAS) state. XLMT is not active below the CRAS state and must be active before this function is allowed.

**System Action:** Processing is ended.

**User Response:** Do the following again:

1. Cycle the TO CPU ID to a state that allows this processing to complete.
2. Enter the ZALMT command again.

See *TPF Operations* for more information about the ZALMT command.

---

**ALMT0003E FROM CPUID *a* NOT BELOW CRAS STATE**

**Where:**

*a* The CPU ID.

**Explanation:** The FROM CPU ID is not below the computer room agent set (CRAS) state. The transfer of queue ownership is not allowed while XLMT is active.

**System Action:** Processing is ended.

**User Response:** Do the following:

1. Cycle the FROM CPU ID to a state that allows this processing to complete.
2. Enter the ZALMT command again.

See *TPF Operations* for more information about the ZALMT command.

---

**ALMT0004E TO AND FROM CPUID ARE IDENTICAL**

**Explanation:** Both of the CPU IDs that were specified are the same.

**System Action:** Processing is ended.

**User Response:** Enter the ZALMT command again with the valid CPU IDs.

See *TPF Operations* for more information about the ZALMT command.

---

**ALMT0005E FROM CPUID NOT SPECIFIED**

**Explanation:** The FROM CPU ID was not specified in the input message.

**System Action:** Processing is ended.

**User Response:** Enter the ZALMT command again with the FROM CPU ID.

See *TPF Operations* for more information about the ZALMT command.

---

**AMOD0050T INV MSG FORMAT**

**Explanation:** The function issues this message when there is a format error in the ZAMOD UP command or the ZAMOD DOWN command.

Possible errors are:

- There were more than eight blanks between the secondary action code and the symbolic module number.
- The symbolic module number contained a character that is not valid.

- A blank was not found between the symbolic module number and the device address.
- There were more than eight blanks between the symbolic module number and the device address.
- The device address contained a character that is not valid.
- A blank was not found immediately after the device address.
- There were more than eight blanks between the device address and the up or down indicator.
- The up or down indicator was not U or D.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAMOD UP and the ZAMOD DOWN commands and for details about the correct format of these commands.

---

**APAT0004E CLASS IS INCOMPATIBLE WITH CORE RESIDENT**

**Explanation:** A file resident program with a class of UNPROTECTED, ISUNIQUE, or PRIVATE cannot be changed to a core resident program. A core resident program with a class of SHARED or COMMON cannot be changed to a class of UNPROTECTED, ISUNIQUE, or PRIVATE.

**System Action:** The ZAPAT command is rejected.

**User Response:** Do one of the following:

- Change the program characteristics to those of a file resident program by entering the ZAPAT command with FR specified for the TYPE parameter.
- Change the value of the CLASS parameter on the ZAPAT command to SHARED or COMMON.
- Do not specify the CLASS parameter on the ZAPAT command.

See *TPF Operations* for more information about the ZAPAT command.

---

**APAT0005E INVALID PROGRAM NAME**

**Explanation:** The program name specified for the ZAPAT command is not valid. Either the program was not found or the program name did not contain 4 alphanumeric characters.

**System Action:** None.

**User Response:** Enter the ZAPAT command and ensure that you specify the correct program name.

See *TPF Operations* for more information about the ZAPAT command.

---

**APAT0006E INVALID ALTER REQUEST FOR CORE COPY**

**Explanation:** The MODE, CLASS, and TYPE parameters are not allowed on a ZAPAT command with a core copy; for example, COPY-C or COPY-B.

**System Action:** None.

**User Response:** None.

---

**APAT0007E INVALID TYPE OPTION**

**Explanation:** The type option specified for the ZAPAT command is not valid.

**System Action:** None.

**User Response:** Enter the ZAPAT command again and ensure that you specify a valid type option.

See *TPF Operations* for more information about the ZAPAT command.

---

**APAT0008E INVALID CLASS OPTION**

**Explanation:** The class option specified for the ZAPAT command is not valid.

**System Action:** None.

**User Response:** Enter the ZAPAT command again and ensure that you specify a valid class option.

See *TPF Operations* for more information about the ZAPAT command.

---

**APAT0009E INVALID MODE OPTION**

**Explanation:** The mode option specified for the ZAPAT command is not valid.

**System Action:** None.

**User Response:** Enter the ZAPAT command again and ensure that you specify a valid mode option.

See *TPF Operations* for more information about the ZAPAT command.

---

**APAT0010E INVALID COPY OPTION**

**Explanation:** The copy option specified for the ZAPAT command is not valid.

**System Action:** None.

**User Response:** Enter the ZAPAT command and ensure that you specify a valid copy option.

See *TPF Operations* for more information about the ZAPAT command.

---

**APAT0012E PRELOAD IS INCOMPATIBLE WITH FILE RESIDENT**

**Explanation:** The PRELOAD parameter was specified on the ZAPAT command for a file resident program. The PRELOAD parameter is valid only for core resident programs.

**System Action:** The ZAPAT command is rejected.

**User Response:** Do one of the following:

- Change the program characteristics to those of a core resident program by entering the ZAPAT command with CR specified for the TYPE parameter.
- Do not specify the PRELOAD parameter on the ZAPAT command.

---

**APAT0013E PROGRAM IS UNALLOCATED – CANNOT PROCESS FILE COPY**

**Explanation:** A request was made to alter the file copy of the program allocation table (PAT) for an unallocated program. Unallocated programs do not have an entry in the file copy of the PAT. Therefore, you can alter only the core copy of the PAT for an unallocated program.

**System Action:** None.

**User Response:** Enter the ZAPAT command again and ensure that you specify the Copy-C option.

See *TPF Operations* for more information about the ZAPAT command.

**APAT0014A ZAPAT CANNOT BE PERFORMED WHILE ALLOCATOR CHANGE IS IN PROGRESS - ZAPAT ABORTED**

**Explanation:** The ZAPAT command cannot be entered while an E-type loader program allocation table (PAT) change request is in progress.

**System Action:** The ZAPAT command is rejected.

**User Response:** Enter the ZAPAT command again after the TPF system completes the PAT change request.

See *TPF Operations* for more information about the ZAPAT command.

**APAT0015E ONLY CLASS-SHARED IS VALID FOR ISO-C LOAD MODULES**

**Explanation:** The class that was specified is not permitted for C load modules. CLASS-SHARED must be specified.

**System Action:** None.

**User Response:** None.

**APAT0101I BEGIN DISPLAY OF FILE COPY FOR IMAGE** *name*

**Where:**

*name*
The image name.

**Explanation:** This is the normal response to the ZAPAT command. It is followed by a display of the original and altered program allocation (PAT) table values for the requested program.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAPAT command and for an example of the informational display.

**APAT0102I BEGIN DISPLAY OF CORE COPY**

**Explanation:** This is the normal response to the ZAPAT command. It is followed by a display of the original and altered program allocation table (PAT) values for the requested program.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAPAT command.

# APGM–AVSN

**APGM0011I BEGIN DISPLAY OF FILE COPY FOR** *comp* **VERSION** *vv* **IN IMAGE** *name*

**Where:**

*comp*
The name of the core image restart (CIMR) area component, initial program load (IPL) component, or CSECT.

*vv* The version code of the component.

**Note:** This displays only for for CIMR and IPL components, and CSECTs that have an associated version code.

*name*
The name of the image containing the CIMR component or CP CSECT. This is not shown for IPL components.

**Explanation:** This is the normal response to the ZAPGM command. This message is followed by a display of two lines of data.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAPGM command and an example of the informational display.

**APPN0001I CP-CP SESSIONS ESTABLISHED WITH CP** *cpname*

**Where:**

*cpname*
The name of the remote CP with which APPN CP-CP sessions have been established.

**Explanation:** This message is issued whenever CP-CP sessions have been established and were not done so due to a TPF operator request, which can happen in the following situations:

- The TPF system was cycled to NORM state.
- The remote operator started CP-CP sessions with the TPF system.
- The TPF system automatically brought up new CP-CP sessions after a failure of the active CP-CP sessions.

**System Action:** None.

**User Response:** None.

**APPN0002I APPN LU REGISTRATION HAS COMPLETED**

**Explanation:** This message is issued when the TPF system has registered all of its LUs with the APPN network.

**System Action:** None.

**User Response:** None.

**APPN0003I CP-CP SESSIONS WITH CP *cpname* HAVE BEEN DEACTIVATED**

**Where:**

*cpname*
The name of the remote CP with which the TPF system had CP-CP sessions.

**Explanation:** CP-CP sessions between the TPF system and the specified remote CP were taken down by the remote operator.

**System Action:** None.

**User Response:** If you want to bring up new CP-CP sessions, enter a ZNETW ACT command.

See *TPF Operations* for more information about the ZNETW ACT command.

**APPN0040W CYCLING DOWN WITH ACTIVE CP-CP SESSIONS**

**Explanation:** This message is issued when the TPF processor with the CP-CP sessions cycles down to 1052 state and the TPF system is running loosely coupled. While this TPF processor is in 1052 state, no TPF processor in the loosely coupled complex can start any new LU-LU sessions in the APPN network.

**System Action:** None.

**User Response:** If new LU-LU sessions must be started, do one of the following:

- Cycle up this TPF processor.
- Break the existing CP-CP sessions, to allow another processor to pick them up.

**APPN0050E UNABLE TO REGISTER LU *luname* IN APPN NETWORK, SENSE *snscode***

**Where:**

*luname*
The name of the TPF logical unit (LU) that was not registered successfully.

*snscode*
The sense code in the reply to the register request.

**Explanation:** This message is issued when the TPF system was not able to register one of its LUs in the APPN network.

**System Action:** None.

**User Response:** Use the sense code to determine the cause of the error.

**APPN0051E CP-CP SESSIONS WITH CP *cpname* HAVE FAILED, ATTEMPTING RECOVERY**

**Where:**

*cpname*
The name of the remote CP with which the TPF system had CP-CP sessions.

**Explanation:** CP-CP sessions between the TPF system and the specified remote CP failed unexpectedly.

**System Action:** The TPF system tries to reestablish CP-CP sessions automatically.

**User Response:** None.

**APPN0052A AUTOMATIC CP-CP SESSION RECOVERY HAS FAILED**

**Explanation:** CP-CP sessions failed unexpectedly and the TPF system was unable to reactivate the CP-CP sessions again.

**System Action:** None.

**User Response:** Do the following:

1. Ensure there is at least 1 active APPN link that supports CP-CP sessions.
2. Enter the ZNETW ACT command (or the equivalent message on the remote system) to activate the CP-CP sessions manually.

See *TPF Operations* for more information about the ZNETW ACT command.

**APPN0053A PROCESSOR *x* DEACTIVATED, CP-CP SESSIONS LOST**

**Where:**

*x* The CPU ID of the TPF processor that was deactivated.

**Explanation:** The TPF processor in the loosely coupled complex that has the CP-CP sessions was deactivated.

**System Action:** None.

**User Response:** Do the following:

1. If the links to the deactivated TPF processor have not gone into automatic network shutdown (ANS) and the network thinks that the CP-CP sessions are still active, deactivate the CP-CP sessions from the remote operator console.
2. Once the old CP-CP sessions are taken down, enter the ZNETW ACT command (or equivalent message from the remote console) to activate new CP-CP sessions.

See *TPF Operations* for more information about the ZNETW ACT command.

**AREC0011I DISPLAY OF FILE ADDRESS *fileaddr***

**Where:**

*fileaddr*
The 16-digit hexadecimal file address.

**Explanation:** This is the normal response to the ZAREC command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAREC command and for an example of the informational display.

**AREC0020I UNIQUE COPIES OF THIS RECORD EXIST FOR OTHER I-STREAMS, PROCESSORS, OR SUBSYSTEM USERS**

**Explanation:** This is an informational message. The record being altered is not shared by all other I-streams, processors, and subsystem users (SSUs).

**System Action:** The physical record is altered for the current (default) I-stream, processor, and SSU name where the command was entered. Other copies, with different physical records, may exist for other I-streams, processors, or SSUs.

**User Response:** Use the IS-x CPUID-y SSU-zzzz optional keywords to alter the physical record for a specific I-stream, processor, or SSU.

See *TPF Operations* for more information about the ZAREC command.

**ASER0000I – OK**

**Explanation:** This is the normal response to the ZASER command.

**System Action:** None.

**User Response:** Enter the ZDSER command from the subsystem to determine which options are in effect.

See *TPF Operations* for more information about the ZASER and ZDSER commands.

**ASER0041E NO PARAMETERS SPECIFIED**

**Explanation:** The ZASER command requires at least one parameter.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZASER command.

**ASER0042E INVALID PARAMETER — *parmx***

**Where:**

*parmx*
The parameter that is not valid.

**Explanation:** The parameter shown is not among the list of valid ZASER parameters.

**System Action:** The ZASER request is ignored.

**User Response:** Enter the ZASER command again and specify valid parameters.

See *TPF Operations* for more information about the ZASER command.

**ASER0097E ICDF NOT LOADED — ZASER PRT REQUEST REJECTED**

**Explanation:** Dumps cannot be routed to the real-time printer if the in core dump formatter is not in the TPF system.

**System Action:** The ZASER command is rejected.

**User Response:** If dumps to the printer are desired, modify the SIPGEN CONFIG macro to cause ICDF to be included in the TPF system generation.

See *TPF Operations* for more information about the ZASER command.

**ASER0098E UNABLE TO RETRIEVE KEYPOINT A — ZASER REQUEST REJECTED**

**Explanation:** Keypoint A is needed to save the system error option changes to file. If it cannot be found, then the file copy of the options cannot be updated.

**System Action:** The ZASER command is rejected.

**User Response:** Review the system dump generated by the CYYM keypoint retrieval program to determine the cause of the error and to correct it

See *TPF Operations* for more information about the ZASER command.

**ASER0099E BSS NOT IN TEST MODE — ZASER PRT REQUEST REJECTED**

**Explanation:** Dumps cannot be routed to the real-time printer when the TPF subsystem is not in test mode.

**System Action:** The ZASER command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZASER command.

**ATIM0001I SUBSYSTEM *xxxx* LOCAL STANDARD TIME**

**Where:**

*xxxx*
The subsystem name.

**Explanation:** This is a normal response to the ZATIM command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0002I TIME OF DAY CLOCK SET**

**Explanation:** This is the normal response to the ZATIM command.

**System Action:** The ZATIM command completed successfully.

**User Response:** None.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0051E INVALID FORMAT**

**Explanation:** The format of the ZATIM command is not correct.

**System Action:** The ZATIM command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZATIM command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0052T FACE ERROR**

**Explanation:** The file address compute program (FACE) returned an error code when trying to find the subsystem clock record.

**System Action:** The ZATIM command request is stopped or ended.

**User Response:** Report this error to your supervisor.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0053T FIND ERROR**

**Explanation:** FIND returned an error code when trying to find the subsystem clock record.

**System Action:** The ZATIM command request is stopped or ended.

**User Response:** Report this error to your supervisor.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0054T TIME BASE ERROR — DISPLAY TIME AND REENTER ZATIM REQUEST**

**Explanation:** The time base did not match the saved HHMM portion from a previous ZDTIM local standard time clock message.

**System Action:** The ZATIM command request is stopped or ended.

**User Response:** Do the following:

1. Display the desired clock again by entering the ZDTIM command.
2. Enter a new alter time request.

See *TPF Operations* for more information about the ZDTIM command.

**ATIM0055T TIME SPECIFIED FOR SET/ADD/TOD IS NOT VALID REQUEST**

**Explanation:** The time specified for the set or add time-of-day (TOD) is not a valid request.

**System Action:** The ZATIM command request is stopped or ended.

**User Response:** None.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0056T SSU DORMANT — ZATIM REQUEST FOR SS IS INVALID**

**Explanation:** The first subsystem user (SSU) in this subsystem (SS) is dormant. The SS clocks may be set in this state.

**System Action:** The ZATIM command request is stopped or ended.

**User Response:** None.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0058T INVALID REQUEST — SYSTEM NOT IN 1052 STATE**

**Explanation:** A ZSTVS CLOCK RESTORE or SET *hhmm mmddyy* command was entered and the TPF system was not in 1052 state. The RESTORE and SET TIME/DATE options are valid only in 1052 state.

**System Action:** The ZATIM command request is stopped or ended.

**User Response:** Do the following:

1. Cycle the TPF system to 1052 state.
2. Enter the command again.

See *TPF Operations* for more information about the program test vehicle (PTV).

**ATIM0059T INVALID TIME/DATE**

**Explanation:** A ZSTVS CLOCK SET *hhmm mmddyy* command was entered with a time or date that is not valid. Either the date was prior to Jan. 04, 1966, or one of the time or date values exceeded the allowable limit (for example, month greater than 12).

**System Action:** The ZATIM command request is stopped or ended.

**User Response:** Enter the command again with the correct time and date.

See *TPF Operations* for more information about the program test vehicle (PTV).

**ATIM0060T INVALID REQUEST — SYSTEM NOT IN 1052 STATE**

**Explanation:** A ZSTVS CLOCK RESTORE or ZSTVS CLOCK SET *hhmm mmddyy* command was entered before the TPF system was in 1052 state. The RESTORE and SET TIME/DATE options are valid only in 1052 state.

**System Action:** The ZATIM command request is stopped or ended.

**User Response:** Do the following:

1. Cycle to 1052 state.
2. Enter the command again.

See *TPF Operations* for more information about the program test vehicle (PTV).

---

**ATIM0061T RESTORE COMPLETE**

**Explanation:** A ZSTVS CLOCK RESTORE request was completed successfully. The times were saved by a ZSTVS CLOCK SET TIME/DATE request.

**System Action:** The ZATIM command request is stopped or ended.

**User Response:** None.

See *TPF Operations* for more information about the program test vehicle (PTV).

---

**ATIM0061E ONLY BSS USERS MAY ALTER THE TIME OF DAY CLOCK**

**Explanation:** The Set Time request message was entered in a subsystem other than the basic subsystem (BSS). This is not allowed.

**System Action:** The ZATIM command request is stopped or ended.

**User Response:** Enter the request again in the BSS.

See *TPF Operations* for more information about the ZATIM command.

---

**ATIM0062T UNABLE — NO PREVIOUSLY SAVED TIMES**

**Explanation:** A ZSTVS CLOCK RESTORE command was entered, however no previous times were saved by a ZSTVS CLOCK SET TIME/DATE request.

**System Action:** The ZATIM command request is stopped or ended.

**User Response:** None.

See *TPF Operations* for more information about the program test vehicle (PTV).

---

**ATIM0063T ALTER THE TIME OF DAY CLOCK IS INVALID AT THIS TIME**

**Explanation:** The time-of-day (TOD) clock was not altered because the basic subsystem (BSS) is not in 1052 state or because the TOD clock is currently being updated.

**System Action:** The ZATIM command request is stopped or ended.

**User Response:** Wait until the previous set time request is finished.

See *TPF Operations* for more information about the ZATIM command.

---

**ATIM0064T TIME OF DAY CLOCK WAS NOT ALTERED**

**Explanation:** An error occurred during the setting of the time-of-day (TOD) clock. This display indicates that the value of the TOD clock was not changed.

**System Action:** The ZATIM command request is stopped or ended.

**User Response:** Do the following:

1. Review any other error displays regarding setting of the TOD clock to determine the cause of the problem and to correct it.
2. Enter the set time request again.

See *TPF Operations* for more information about the ZATIM command.

---

**ATIM0070E INVALID REQUEST — COMPLEX NOT USING STR TIME**

**Explanation:** A ZATIM *xxxx* STR GOOD command was entered on a processor to resynchronize it back into a complex that is using the Sysplex Timer (STR) as the synchronous source and the time value from the STR. However, the request is rejected because it found that the complex is not using the time value from the STR (for example, a ZATIM *xxxx* TOD *hhmmss ddmmyy* command or a ZATIM *xxxx* TOD GOOD command may have been used when establishing the synchronous source in the complex.

**System Action:** None.

**User Response:** Do one of the following:

- IPL the processor to establish synchronization with the complex
- Enter a ZATIM *xxxx* TOD STR command to set the complex with the time value obtained from the STR.

See *TPF Operations* for more information about the ZATIM command.

---

**ATIM0071T CTKI RETRIEVAL ERROR; UNABLE TO DETERMINE TIME SOURCE**

**Explanation:** Keypoint I (CTKI) could not be retrieved and the TPF system is unable to determine whether the complex was synchronized to the time of the Sysplex Timer (STR).

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** Do the following:

1. Determine why CTKI could not be retrieved from disk.
2. Correct the problem.

See *TPF Operations* for more information about the ZATIM command.

---

**ATIM0073E PROCESSOR NOT IN 1052 STATE**

**Explanation:** The processor needs to be in restart or 1052 state.

**System Action:** None.

**User Response:** Do the following:

1. Cycle the processor to 1052 state.
2. Enter the ZATIM command again.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0075E FORMAT ERROR**

**Explanation:** There was a format error on the input TOD message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0076E INVALID TIME/DATE**

**Explanation:** The time or date specified for setting the time-of-day (TOD) clock was not valid. The time must be specified using the 24-hour clock in the form the form of HHMMSS. The date must be specified using the form of MMDDYY.

Specifying numbers outside the 24-hour clock range or dates outside the true calendar are flagged as incorrect. For example, 022983 is not correct because 1983 was not a leap year.

**System Action:** None.

**User Response:** Do the following:

1. Determine whether the time or date was incorrect.
2. Correct the time or date.
3. Enter the ZATIM command with the correct time or date.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0077A UNABLE TO CONFIRM— TOD CLOCK NOT SET 'ZATIM SET TOD' REQ'D— ENTER FORMAT: 'ZATIM HHMM TOD HHMMSS MMDDYY'**

**Explanation:** A GOOD parameter for the time was specified during a set time request but the time-of-day (TOD) clock found an error condition when it tried to store the current time. The TOD is inoperative, not running, in error, or not set.

**System Action:** None.

**User Response:** Try to set the time (by entering the ZATIM command), giving a time and date rather than a GOOD parameter. If the TOD clock can be started or be set, it is done by the set time request.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0078E DATE MUST BE LATER THAN MAY 11, 1971**

**Explanation:** Either the date specified through the time-of-day (TOD) message or the date retrieved from the Sysplex Timer (STR) was not later than the date allowed by the high-order bits in the TOD clock (May 11, 1971).

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** Do one of the following:

- Enter the ZATIM command again with the proper date
- Change the date on the Sysplex Timer (STR).

See *TPF Operations* for more information about the ZATIM command. See *370/XA Principles of Operation* for more information about the time-of-day (TOD) clock.

**ATIM0080T INVALID PARAMETER IN ZATIM TSC REQUEST**

**Explanation:** One of the following problems occurred in the input message:

- One of these required parameters is missing:
  - STRNM-
  - NETID-
  - STRID-
  - SSA-
- The value is missing for one of the required parameters.
- The specified STRNM parameter was longer than four characters.
- The specified NETID or STRID parameter is longer than two digits.
- The specified digits in the NETID OR STRID parameter was not in the valid range of 0 through 9.
- The specified NETID parameter was not between 0 through 31.
- The specified STRID parameter was not between 0 through 15.
- The specified SSA parameter was longer than one digit or is not between 0 through 7.

**System Action:** None.

**User Response:** Enter the ZATIM TSC command again in the correct format.

See *TPF Operations* for more information about the ZATIM command. See *TPF System Generation* for more information about migration aids.

**ATIM0081T ZATIM TSC REQUEST IS ONLY ALLOWED ON AN HPO SYSTEM**

**Explanation:** The time-of-day (TOD) synchronization compatibility (TSC) hardware is only intended for use on a loosely coupled TPF system where there are CPCs capable of being directly attached to a Sysplex Timer (STR) and CPCs that require the TOD RPQ in the complex at the same time. Because this is not a loosely coupled TPF system, the ZATIM TSC command is rejected.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZATIM command. See *TPF System Generation* for more information about migration aids.

**ATIM0082I TOD SYNCHRONIZATION COMPATIBILITY (TSC) INFORMATION ADDED TO CTKI**

**Explanation:** This message indicates the successful completion of the ZATIM TSC request. The time-of-day (TOD) synchronization compatibility (TSC) information was added to keypoint I. The Sysplex Timer (STR) can now be used as a synchronization source. For TOD RPQ processors connected to an STR through the TSC hardware, the STRNM parameter must be included in the ZATIM TOD command.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZATIM command. See *TPF System Generation* for more information about migration aids.

**ATIM0083T CTKI RETRIEVAL ERROR; UNABLE TO ADD TOD SYNCHRONIZATION COMPATIBILITY (TSC) INFORMATION.**

**Explanation:** An unsuccessful attempt was made to retrieve keypoint I by using the CYYM keypoint retrieval program. This occurred during processing of a ZATIM TSC command.

**System Action:** None.

**User Response:** Determine the cause of the CTKI error and correct it.

See *TPF Operations* for more information about the ZATIM command. See *TPF System Generation* for more information about migration aids.

**ATIM0084T NO AVAILABLE ENTRIES IN CTKI; UNABLE TO ADD TOD SYNCHRONIZATION COMPATIBILITY (TSC) INFORMATION**

**Explanation:** The synchronization selection address (SSA) specified in the ZATIM TSC command does not exist in Keypoint I (CTKI) The time-of-day (TOD) synchronization compatibility (TSC) information cannot be added to CTKI because all the entries are in use. This problem could occur if an SSA is used in more than one CTKI entry.

**System Action:** None.

**User Response:** Enter the ZDFIL command to display the TOD clock synchronization CPC identification table at the end of CTKI.

If an SSA is being used in more than one table entry, enter the ZAFIL command to correct the problem. Then, enter the ZATIM TSC command again.

Otherwise, enter the ZAFIL command to add the TSC information to CTKI.

See *TPF Operations* for more information about the ZATIM command. See *TPF System Generation* for more information about migration aids.

**ATIM0085E SOME PROCESSORS NOT IN 1052 STATE**

**Explanation:** All processors in the TPF system must be in 1052 state for a time-of-day (TOD) clock to be set, unless the BP option was specified. The TOD clock is the basis of the other clocks in the TPF system. The other clocks are set with respect to the TOD clock during cycling to NORM state. The loosely coupled master determines the setting on the TPF system TOD clock.

If the BP option is invoked, the loosely coupled master switches to the processor setting the time. The other processors in the loosely coupled TPF system are informed that the TOD clock was reset. Those in 1052 state will reset their times.

**System Action:** None.

**User Response:** If this is not a loosely coupled TPF system, cycle the TPF system to 1052 state and enter the set time request again.

If this is a loosely coupled TPF system, determine first whether the processor where the set time request was entered is or is to become the master. If it is not to become the master, switch to the processor of the loosely coupled master. Use the BP option to force the set time request or cycle all the processors in the TPF system to 1052 state.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0086E CYCLE ALREADY DISABLED IN THIS PROCESSOR**

**Explanation:** The TPF system issues this message when you enter a set time request before a previous set time request finished or some other process disabled the TPF system from cycling.

**System Action:** None.

**User Response:** Wait until the previous set time request is finished. If, due to an error condition, there is no previous request outstanding enter the ZPSMS CYCLE ENABLE BP command to enable cycling again.

During set time requests, cycling is disabled, so enter the set time request again.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0087E UNABLE TO INHIBIT CYCLE**

**Explanation:** Processing of the set time request was unable to inhibit cycling above 1052 state. The set time request was ended to preserve the integrity of the TPF system clocks.

**System Action:** None.

**User Response:** Cycle the TPF system to 1052 state or enable cycling again by entering the ZPSMS CYCLE ENABLE BP command.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0088E CTKI RETRIEVAL ERROR**

**Explanation:** Keypoint CTKI could not be retrieved to update the time-of-day (TOD) clock synchronization fields.

**System Action:** None.

**User Response:** Report the problem to your system programmer.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0089E ZATIM TOD VALID ONLY FROM CPU-ID *x***

**Where:**

*x* The CPU ID.

**Explanation:** A time-of-day (TOD) message was issued on a processor that is currently not the master for TOD time and date in a loosely coupled TPF system.

The current master is the processor identified by *x*.

**System Action:** None.

**User Response:** Enter the TOD message again with the BP option on this CPU or enter the message on the processor identified by *x*.

If the message is entered again on this CPU with the BP option, this processor becomes the master for TOD date and time.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0090A KEYPOINT INDICATES ALL PROCESSORS ARE NOT IN 1052 STATE ENTER 'ZATME CONT' TO CONTINUE OR 'ZATME CNCL' TO CANCEL THE ZATIM REQUEST**

**Explanation:** There are processors in the complex that are above 1052 state.

**System Action:** None.

**User Response:** Enter a ZATME CONT command to continue the ZATIM TOD operation or enter a ZATME CNCL command to cancel the ZATIM TOD request.

See *TPF Operations* for more information about the ZATME command.

**ATIM0091E INVALID REQUEST — ALTPORT PARAMETER NOT ALLOWED**

**Explanation:** There are two cases when the ALTPORT parameter is not allowed:

- The request was denied because the only time the active stepping port can be switched is when each port of a CPC goes to a different Sysplex Timer (STR) and these STRs are not coupled. If each port goes to the same STR, there is no need to switch the active stepping port. If each port goes to a different STR and these STRs are coupled, then the time and the synchronization source would be the same in each STR. There is no need to switch the active stepping port.

  **Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.
- When running under PR/SM, the ALTPORT parameter is not allowed on the ZATIM command.

**System Action:** None.

**User Response:** Enter the ZATIM command again without the ALTPORT parameter.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0092E INVALID REQUEST — STRNM PARAMETER NOT ALLOWED**

**Explanation:** The STRNM parameter is used to specify that the time-of-day (TOD) synchronization compatibility (TSC) hardware is connected to this CPC. In order for the TSC to be connected, the TOD RPQ must exist on this CPC. This message is entered because the TOD RPQ is not present.

**System Action:** None.

**User Response:** Enter the ZATIM command again without the STRNM parameter.

See *TPF Operations* for more information about the ZATIM command.

**ATIM0093E INVALID REQUEST — STR PARAMETER NOT ALLOWED**

**Explanation:** The time given by the Sysplex Timer (STR) can only be used to set up the time-of-day (TOD) clocks on CPCs that are directly connected to an STR.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** Enter the ZATIM command again one of the following formats:

- ZATIM HHMM TOD HHMMSS MMDDYY
- ZATIM HHMM TOD GOOD

See *TPF Operations* for more information about the ZATIM command

**ATIM0094A UNABLE TO RETRIEVE STR TIME RELIABLY ZATIM SET TOD REQ'D ENTER ONE OF THE FOLLOWING FORMATS 'ZATIM HHMM TOD HHMMSS MMDDYY' OR 'ZATIM HHMM TOD GOOD'**

**Explanation:** An unsuccessful attempt was made to retrieve the Sysplex Timer (STR) time.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** Do one of the following:

- Enter the ZATIM command again by using one of the formats provided in the message.

- Determine whether the CPC stepping port is operational or whether there is a problem with the processor controller on the CPC.
- See your IBM service representative to check the possible problem with the processor controller.

See *TPF Operations* for more information about the ZATIM command.

---

**ATIM0095E SERIAL NUMBER/SSA NOT FOUND IN CTKI –'STRNM- ' PARM REQUIRED**

**Explanation:** In a loosely coupled complex on a CPC with a time-of-day (TOD) RPQ, a synchronization selection address (SSA) is required. An SSA could not be associated with this CPC because the serial number for the CPC was not found in keypoint I. However, the TOD synchronization compatibility (TSC) hardware information was found, and therefore, the STRNM parameter was expected on the ZATIM command to indicate the port connected to a TSC should be used. Because the STRNM parameter was not included in the input message, no SSA could be assigned.

**System Action:** None.

**User Response:** If the CPC is connected to a TSC, enter the ZATIM command again with the STRNM parameter.

Otherwise, determine why the serial number for this CPC was not found in keypoint I. The online commands ZDKAT and ZDFIL can be used to determine the file address and content of keypoint I. The ZAFIL command can be used to modify the content of keypoint I after you have determined the cause of the problem.

See *TPF Operations* for more information about the ZATIM command.

---

**ATIM0096W SYNC SOURCE SWITCHING FROM STR TO TOD RPQ**

**Explanation:** The master synchronization source was a Sysplex Timer (STR). Because this CPC has a time-of-day RPQ, and the STRNM parameter was not specified on the ZATIM command, the TOD RPQ becomes the new synchronization source.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** If you want the TOD RPQ to be the new synchronization source, then no action is necessary. However, if you want the Sysplex Timer (STR) to remain the synchronization source and this CPC is connected to an STR through the TOD synchronization compatibility (TSC) hardware, enter the ZATIM command again with the STRNM parameter.

If you want the STR to remain the synchronization source and this CPC is not connected to a TSC, then enter the ZATIM command again from another CPC.

See *TPF Operations* for more information about the ZATIM command.

---

**ATIM0097E STRNM DEFINITION NOT FOUND IN CTKI**

**Explanation:** The name specified in the STRNM parameter was not found in keypoint I.

**System Action:** None.

**User Response:** Do the following:

1. Specify an STRNM name that is in keypoint I.
2. Enter the ZATIM command again.

See *TPF Operations* for more information about the ZATIM command.

---

**ATIM0098E BP OR STRNM OPTIONS REQD SINCE STR IS SYNC SOURCE**

**Explanation:** Currently, a Sysplex Timer (STR) is the synchronization source. This CPC has a time-of-day (TOD) RPQ but the STRNM parameter was not specified on the ZATIM command.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** Enter the ZATIM command again with the bypass option (BP) to switch the synchronization source from the Sysplex Timer (STR) to the TOD RPQ. Otherwise, enter the ZATIM command again with the STRNM parameter to keep the STR as the synchronization source when there is TOD synchronization compatibility (TSC) hardware connected to the CPC.

See *TPF Operations* for more information about the ZATIM command.

---

**ATIM0099E INVALID NUMBER OF LEAP SECONDS IN CTKI**

**Explanation:** A nonzero value for the number of leap seconds in keypoint I (CTKI) indicates that the time-of-day (TOD) clock is using absolute time. The ZATIM request was not processed because the number of leap seconds in keypoint I is greater than 50.

**System Action:** None.

**User Response:** Use the ZDKAT and ZDFIL commands to determine the file address and content of keypoint I. The ZAFIL command can be used to modify the number of leap seconds in keypoint I. If a Sysplex Timer (STR) is available, determine the correct number of leap seconds from the STR device panel that displays offsets. After altering keypoint I, enter the ZATIM command.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

See *TPF Operations* for more information about the ZATIM command.

---

**ATME0001I ZCYCL WILL CONTINUE AS REQUESTED**

**Explanation:** This is a normal message for the ZATME command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZATME command.

**ATME0002I ZCYCL CANCELLED AS REQUESTED**

**Explanation:** This is a normal message for the ZATME command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZATME command.

**ATME0003I ZATIM WILL CONTINUE AS REQUESTED**

**Explanation:** This is a normal message for the ZATME command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZATME command.

**ATME0004I ZATIM CANCELLED AS REQUESTED**

**Explanation:** This is a normal message for the ZATME command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZATME command.

**ATME0051E INVALID FORMAT**

**Explanation:** This message results when the ZATME command is entered in an incorrect format.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZATME command and its format.

**ATME0052E ZATME COMMAND IS NOT VALID AT THIS TIME**

**Explanation:** The ZATME command was not entered in response to a date change command or a ZATIM continue command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZATME command.

**AURS0006E INPUT FORMAT ERROR**

**Explanation:** The ZAURS command was entered incorrectly.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

**AURS0007E INVALID DEVICE ADDRESS**

**Explanation:** The address specified in the command contains hexadecimal characters that are not valid or the address is not in the unit record status table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

**AURS0008E DEVICE NOT IN U/R STATUS TABLE**

**Explanation:** The device specified in the input message is not in the status table or the status table has no entries. The symbolic name is not in the unit record status table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

**AURS0009E INVALID DEVICE TYPE**

**Explanation:** The device type specified in the input message is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

**AURS0010E ERROR IN FINDING BUFFER TABLE**

**Explanation:** CUAB found an error on the FIND of the buffer for the type of printer specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

**AURS0011E INVALID BUFFER NAME**

**Explanation:** The buffer name was not found in the table associated with the device at the input address.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

**AURS0012E ERROR ON BUFFER LOAD**

**Explanation:** While trying to run a URCTC macro (which causes the user-provided CCCWs) to be processed to a specified unit record device) a hardware error occurred. The device was suspended.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

**AURS0013I FCB LOADED-RESET FORM TO LINE 1**

**Explanation:** This is the normal response to the ZAURS FCBL command.

While trying to process a URCTC macro (which causes the user-provided CCWs to be processed to a specified unit record device) a hardware error occurred. The device was suspended.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS FCBL command.

**AURS0015I UCSB LOADED**

**Explanation:** This message is issued if the universal character set buffer is loaded successfully on a specified unit record device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

**AURS0016E DEVICE IN USE**

**Explanation:** The device is in use by another application program.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

**AURS0017E JOB NOT IN U/R JOB TABLE**

**Explanation:** The job specified in the input message is not in one of the job tables.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands. See *TPF Database Reference* for more information about the unit record message editor.

**AURS0018E SYSTEM ACTIVITY TOO HIGH — JOB NOT STARTED**

**Explanation:** The TPF system activity is too high so the job is not started.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands. See *TPF Database Reference* for more information about the unit record message editor.

**AURS0019E TOO MANY SYM NAMES SPECIFIED**

**Explanation:** The number of symbolic names specified in the input message is more than the number of unit record devices in the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

**AURS0020E NO DEVICES AVAILABLE**

**Explanation:** One or more of the requested unit record devices were not available.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

**AURS0021E TAPE HARDWARE ERROR**

**Explanation:** An unexpected error occurred during tape processing.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

**AURS0022E LENGTH ERR– JOB ABORTED**

**Explanation:** A long length record error was found by the Tape to Print utility while reading a tape device. The utility request is aborted.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

**AURS0050I UNIT RECORD STATUS**

**Explanation:** This is the normal response to the ZAURS DURT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS DURT command and for an example of the informational display.

---

**AURS0051I REQUEST SUMMARY NOT ABORTED:** *xxx* **ABORT STARTED ON:** *vxxx* **SUSPENDED AND ABORT STARTED:** *xxx*

**Explanation:** This is the normal response to the ZAURS ABRT command.

**System Action:** None.

**User Response:** None.

---

**AURS0052I OPTION** *xx* **COMPLETED**

**Where:**

*xx* The option name.

**Explanation:** This is the normal response to the ZAURS command with the UTIL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

---

**AURS0053W OPT** *xx* **ABORTED**

**Where:**

*xx* The option name.

**Explanation:** An input/output (I/O) error occurred while processing the ZAURS UTIL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

---

**AURS0054E 1055 BYTES OF SOME RCDS PRINTED**

**Explanation:** The first 1055 bytes of a record greater than 1055 bytes were printed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

---

**AVSN0000I VSN ON DISK** *ccud* **IS** *vvvvvv*

**Where:**

*ccud*
The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The function issues this message upon normal completion of a ZAVSN request. This messages displays the volume serial number (VSN) prior to the alter. This message is followed by the AVSN0001I message after the VSN is changed.

**System Action:** Processing of the ZAVSN command is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZAVSN command.

---

**AVSN0001I ALTER OF VSN COMPLETE**

**Explanation:** The function issues this message after the volume serial number (VSN) was changed due to a ZAVSN request. This message follows the AVSN00I message, which displays the VSN before it was altered.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAVSN command.

---

**AVSN0058T I/O ERROR READING VSN**

**Explanation:** The function issues this message when an input/output (I/O) error occurs while trying to read the existing volume serial number (VSN).

**System Action:** Program processing is ended and the volume serial number (VSN) on the device is not altered.

**User Response:** See your system programmer or IBM service representative to determine the cause of the error and to correct the hardware problem.

See *TPF Operations* for more information about the ZAVSN command.

---

**AVSN0061T INPUT VSN IS NON-STANDARD**

**Explanation:** This message is issued when you specify a volume serial number (VSN) with characters that are not valid.

Valid characters are:
- A through Z
- 0 through 9.

Nonstandard characters are allowed only when they are framed with apostrophes as the first and last characters.

**System Action:** Program processing is ended and the volume serial number (VSN) on the device is not altered.

**User Response:** Enter the ZAVSN command again with a VSN that conforms to the standards.

See *TPF Operations* for more information about the ZAVSN command.

---

**AVSN0062T I/O ERROR WRITING VSN**

**Explanation:** This message occurs when the new volume serial number (VSN) cannot be written to the device.

**System Action:** Program processing is ended and the volume serial number (VSN) on the device is not altered.

**User Response:** See your system programmer or an IBM service representative to determine the source of the error and to correct the hardware problem.

See *TPF Operations* for more information about the ZAVSN command.

**AVSN0066T VOLUME LABEL NOT SPECIFIED FOR AN ALTER**

**Explanation:** This message is issued when you do not specify a volume serial number (VSN) after the device address in the ZAVSN command.

**System Action:** Program processing is ended and the volume serial number (VSN) on the device is not altered.

**User Response:** Enter the ZAVSN command again with a volume serial number (VSN) specified.

See *TPF Operations* for more information about the ZAVSN command.

**AVSN0067T ALTER FOR AN IN—USE DEVICE NOT ALLOWED**

**Explanation:** You cannot alter the volume serial number (VSN) on an online device. This restriction is in place to preserve the relationship between the device relative module number and its VSN. You can only alter the VSNs for offline devices.

**System Action:** Program processing is ended and the volume serial number (VSN) on the device is not altered.

**User Response:** If it is necessary to alter the volume serial number of this device, take it offline and enter the ZAVSN command again.

See *TPF Operations* for more information about the ZAVSN command.

**AVSN0088T TO DEVICE IS UNUSABLE**

**Explanation:** This error occurred during processing of the ZAVSN command. An attempt was made to mount a device through CPAB, but an input/output (I/O) error occurred during an attempt to mount the 3990 Record Cache Subsystem device.

**System Action:** Program processing is ended and the volume serial number (VSN) on the device is not altered.

**User Response:** See your IBM service representative to help you determine the cause of the error.

See *TPF Operations* for more information about the ZAVSN command.

**AVSN0090T ATTEMPT TO MOUNT REQUESTED VOLUME *ccud* FAILED**

**Where:**

*ccud*
The device address.

**Explanation:** The error occurred during processing of the ZAVSN command. An attempt was made to mount the requested volume through CPAA but an error occurred during mount processing. Because of this error, the volume could not be used.

At the time the problem was detected, a more detailed diagnostic message was issued by CPAA to describe the reason that the volume could not be mounted to the TPF system. That message, which has a CPAA prefix, will precede the AVSN0090T message on your console.

**System Action:** Program processing is ended. The volume serial number (VSN) on the device is not altered.

**User Response:** None.

See *TPF Operations* for more information about the ZAVSN command.

# BBLD–BCP6

**BBLD0001I IPART INITIALIZATION COMPLETED**

**Explanation:** The IBM pool allocation resource table (IPART) was successfully built in memory.

**System Action:** None.

**User Response:** None.

**BBLD0002E IPART INITIALIZATION FAILED**

**Explanation:** The IBM pool allocation resource table (IPART) was not built in memory because of errors that were explained in a previous online message.

**System Action:** None.

**User Response:** Do the following:

1. Determine why the IPART could not be built successfully.
2. Correct the problem.

**BBLD0003E FACE ERROR ON *rectype* ORDINAL NUMBER *ordnum***

**Where:**

*rectype*
The record type of the file record that is being retrieved.

*ordnum*
The ordinal number of the specified record type.

**Explanation:** During IBM pool allocation resource table (IPART) initialization, an error was received from the file address compute (FACE) program when attempting to determine the file address for the specified record type and ordinal number.

**System Action:** The IPART is not built in memory.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

**BBLD0004E FIND ERROR *error* ON *rectype* ORDINAL NUMBER *ordnum***

**Where:**

*error*
The value of the detailed error indicator (SUD) identifying the specific nature of the I/O error.

*rectype*
The record type of the file record that is being retrieved.

*ordnum*
The ordinal number of the specified record type.

**Explanation:** During IBM pool allocation resource table (IPART) initialization, an error was received while attempting to retrieve the specified record type and ordinal number from the TPF database.

**System Action:** The IPART is not built in memory.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

---

**BBLD0006E INSUFFICIENT SYSTEM HEAP**

**Explanation:** During IBM pool allocation resource table (IPART) initialization, an error occurred while trying to obtain system heap frames to store the IPART.

**System Action:** The IPART is not built in memory.

**User Response:** Do the following:

1. Determine why the TPF system did not have enough system heap frames to satisfy the request.
2. Correct the problem.

---

**BBLD0007E NO POOL SEGMENTS DEFINED IN #PSTXCUR RECORDS**

**Explanation:** During IBM pool allocation resource table (IPART) initialization, there were no pool segments defined in the current pool segment table (#PSTXCUR) records.

**System Action:** The IPART is not built in memory.

**User Response:** Do the one of following:

- If pool segments have not been defined to the TPF system, there is no action to be taken.
- If pool segments have been defined to the TPF system, do the following:
  1. Determine why the count of pool segments in the #PSTXCUR records is set to zero.
  2. Correct the problem.

---

**BBLD0008E ERROR GETTING LOCATION OF CINFC LABEL FOR IPART**

**Explanation:** During IBM pool allocation resource table (IPART) initialization, an error occurred while trying to retrieve the location of the CMMIPART CINFC tag.

**System Action:** The IPART is not built in memory.

**User Response:** Do the following:

1. Determine why the CMMIPART CINFC tag could not be located in memory.
2. Correct the problem.

---

**BCAI0001A RECOUP RESTART REQUIRED**

**Explanation:** Recoup was running before an IPL occurred. The utility needs to be started again.

**System Action:** None.

**User Response:** Enter **ZRECP RESTART** to restart recoup.

See *TPF Operations* for more information about the ZRECP RESTART command.

---

**BCAI0002A DBR START OR RESTART REQUIRED**

**Explanation:** Database reorganization (DBR) was running before an IPL occurred. The utility needs to be started again.

**System Action:** None.

**User Response:** Enter **ZDBRO START** or **ZDBRO RESTART** to start or restart DBR.

See *TPF Operations* for more information about the ZDBRO START and ZDBRO RESTART commands.

---

**BCAI0003A PDU RE-RUN REQUIRED**

**Explanation:** During recoup or pool directory update (PDU) processing, an error condition was detected by a find macro or FACE-type call while trying to retrieve the recoup status history control (#RGSTAT) record.

**System Action:** Recoup processing ends on the subsystem it was running on but continues on the next subsystem.

**User Response:**

1. Check the recoup status history control (#RGSTAT) record to determine the cause of the problem.
2. Correct the problem.

See *TPF System Macros* and *TPF Application Programming* for more information about find macros, the file address compute (FACE) program, and the FACE interface.

---

**BCAI0008E RCPST1 FACE/FIND ERROR**

**Explanation:** During recoup or pool directory update (PDU) processing, an error condition was detected by a find macro or FACE-type call while trying to retrieve the recoup status history control (#RGSTAT) record.

**System Action:** Recoup processing ends on the subsystem it was running on but continues on the next subsystem.

**User Response:**

1. Check the recoup status history control (#RGSTAT) record to determine the cause of the problem.
2. Correct the problem.

See *TPF System Macros* and *TPF Application Programming* for more information about find macros, the file address compute (FACE) program, and the FACE interface.

---

**BCAI0009E PROT UT FACE/FIND ERROR**

**Explanation:** During recoup or pool directory update (PDU) processing, an error condition was detected by a find macro or FACE-type call while trying to retrieve the utility control record.

**System Action:** Recoup processing ends on the subsystem it was running on but continues on the next subsystem.

**User Response:**

1. Check the utility control record to determine the cause of the problem.

2. Correct the problem.

See *TPF System Macros* and *TPF Application Programming* for more information about find macros, the file address compute (FACE) program, and the FACE interface.

---

**BCC00000A FIXED ADDRESS - *faddr*, HAS LOOPING CHAIN, PROCESSING WILL CONTINUE *originid***

**Where:**

*faddr*
The file address of the looping record.

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup chain chase processing detected a record that is looping.

**System Action:** Recoup chain chase processing continues with the next record.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

---

**BCPE0003E FACE/FIND ERROR EXCLUSION TABLE RECORD**

**Explanation:** The ZDUPD command was entered, but an error condition was detected while trying to retrieve (using the FACE, FIWHC, FILUC, or WAITC macro) the recoup FC33 exclusion table record (index for exclusion processing for pool directory update (PDU) processing).

**System Action:** The command fails.

**User Response:** Check the exclusion record that is indexed by the recoup FC33 exclusion table (#EXCTBL) to determine the cause of the problem.

See *TPF Operations* for more information about the ZDUPD command.

---

**BCPE0007E FACE/FIND/FILE ERROR ON FC33 ORDINAL *ordnum***

**Where:**

*ordnum*
The hexadecimal ordinal number of the released pool address (FC33) directory record.

**Explanation:** The ZDUPD command was entered, but an error condition was detected while trying to retrieve or file the released pool address (FC33) record, which is an index into file pool address return blocks.

**Note:** The record ID for file pool address return blocks is CA; therefore, file pool address return block records are known as CA records.

**System Action:** The command fails.

**User Response:** Determine the cause of the problem.

See *TPF Operations* for more information about the ZDUPD command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**BCPE0010I BCPU - END OF DIRECTORY UPDATE**

**Explanation:** This is a normal response to the ZDUPD command with the C parameter specified or to the ZRECP PROCEED command indicating that pool directory update (PDU) rollin processing has completed. This message is followed by counts of the returned addresses.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDUPD and ZRECP PROCEED commands.

---

**BCPE0011I BCPE - END OF DIRECTORY UPDATE**

**Explanation:** This is a normal response to the ZDUPD command with the C parameter specified or to the ZRECP PROCEED command indicating that pool directory update (PDU) rollin processing has completed and the total number of addresses returned has been displayed. This message is followed by counts of the returned addresses.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDUPD and ZRECP PROCEED commands.

---

**BCPI0002E RECOUP KEYPOINT FIND ERROR**

**Explanation:** During recoup processing, an error condition was detected by a FACE-type call while trying to retrieve the recoup master keypoint (#BKMST) record.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Check the recoup master keypoint (#BKMST) record to determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BCPU0002W FACE/FIND/FILE ERROR ON FC33 ORDINAL 00000064**

**Explanation:** During recoup processing, an error condition is detected while trying to retrieve or file the 1052-state released pool address (FC33) record.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF Database Reference* for more information about recoup functions and procedures.

**BCPY0001I - KEYPOINT 9 AND SONRI SAVE STARTED**

**Explanation:** This a normal response to the ZRDIR CAPTURE command or during recoup processing.

**System Action:** The capture function continues.

**User Response:** None.

See *TPF Operations* for more information about the ZRDIR CAPTURE command.

**BCPY0002I - KEYPOINT 9 AND SONRI SAVE COMPLETE**

**Explanation:** This is the normal response to the ZRDIR CAPTURE command or during recoup processing.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRDIR CAPTURE command.

**BCPY0003E ZRDIR START RESTORE NOT VALID WHEN RECOUP IS ACTIVE**

**Explanation:** The ZRDIR START RESTORE command was entered, but recoup processing is active.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait until recoup processing ends.
2. Enter the ZRDIR START RESTORE command again.

See *TPF Operations* for more information about the ZRDIR START RESTORE command.

**BCPZ0001E RECOUP BAD CALL TO ROUTINE - FIX AND RESTART**

**Explanation:** During recoup processing, the BCPFUN field in the BCPBC data area contained a function number for which there was no function in the BCPZ table (function table in the BCPZ program).

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF Database Reference* for more information about recoup functions and procedures.

**BCPZ0004E RECOUP CREM ECB ERROR OR TIMEOUT**

**Explanation:** Recoup processing failed because all of the entry control blocks (ECBs) did not complete or an ECB error condition was found.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF Database Reference* for more information about recoup functions and procedures.

**BCPZ0006E RECOUP PSEUDO DIRECTORY FACE ERROR FACE TYPE *facetype* ORDINAL HEX *hexord***

**Where:**

*facetype*
The FACE table record type of a recoup pseudo directory (#SONRPE) record.

*hexord*
The ordinal number of a recoup pseudo directory (#SONRPE) record.

**Explanation:** An error condition was detected by a FACE-type call while trying to retrieve the recoup pseudo directory (#SONRPE).

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF Database Reference* for more information about recoup functions and procedures.

**BCPZ0007E RECOUP PSEUDO DIRECTORY MISMATCH ERROR FACE TYPE *facetype* ORDINAL HEX *hexord***

**Where:**

*facetype*
The file address compute (FACE) program table record type of a recoup pseudo directory (#SONRPE) record.

*hexord*
The ordinal number of a recoup pseudo directory (#SONRPE) record.

**Explanation:** During recoup processing, the ordinal number in the BCPBC data area and the recoup pseudo directory (#SONRPE) ordinal number are not the same.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.

2. Correct the problem.
3. Start recoup again.

See *TPF Database Reference* for more information about recoup functions and procedures.

**BCPZ0008E RECOUP PSEUDO DIRECTORY FIND ERROR FARW = *farw***

**Where:**

*farw*
The file address reference word that is used to read the record.

**Explanation:** During recoup processing, an error condition was detected by the FINWC macro while trying to find the recoup pseudo directory (#SONRPE).

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF General Macros* for more information about the FINWC macro. See *TPF Database Reference* for more information about recoup functions and procedures.

**BCPZ0009E RECOUP PROCESS PAUSED - MUST RESTART OR ABORT**

**Explanation:** Recoup processing found an error condition that caused recoup to pause.

**System Action:** None.

**User Response:**

1. Determine why recoup was paused.
2. Do one of the following:
   - Restart recoup.
   - Abort recoup.

**BCP00003I RECOUP GFS ACTIVITY ADD STARTED**

**Explanation:** This is a normal response during recoup processing indicating the start of the get file storage (GFS) step of recoup.

**System Action:** None.

**User Response:** None.

**BCP00004I RECOUP GFS ACTIVITY ADD COMPLETE**

**Explanation:** This is a normal response or during recoup processing indicating the end of the get file storage (GFS) step of recoup.

**System Action:** None.

**User Response:** None.

**BCP00005I RECOUP 'PRE' PHASE 1 RELEASE PASS STARTED**

**Explanation:** This is a normal response during recoup processing indicating the start of the pre-release step of recoup.

**System Action:** None.

**User Response:** None.

**BCP00006I RECOUP 'PRE' PHASE 1 RELEASE PASS COMPLETE**

**Explanation:** This is a normal response or during recoup processing indicating that the pre-release step of recoup is completed.

**System Action:** None.

**User Response:** None.

**BCP00007I RECOUP BUILD ERRONEOUS AVAILABLE STARTED**

**Explanation:** This is a normal response during recoup processing indicating the start of the erroneously available step of recoup.

**System Action:** None.

**User Response:** None.

**BCP00008I RECOUP BUILD ERRONEOUS AVAILABLE COMPLETE**

**Explanation:** This is a normal response during recoup processing indicating that the erroneously available step of recoup has completed.

**System Action:** None.

**User Response:** None.

**BCP00009W RECOUP ID ANALYSIS BYPASSED - GFS INACTIVE**

**Explanation:** The ZRECP RESUME or ZRECP RERUN command was entered, but the TPF system is in 1052 state and ID analysis in phase 3 of recoup has not been run.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RESUME and ZRECP RERUN commands.

**BCP00010A RECOUP ENTER ZRECP PROTECT OR IGNORE TO CONTINUE**

**Explanation:** This is the normal response to the ZRECP RESUME or ZRECP RERUN command after erroneously available addresses have been identified.

**System Action:** None.

**User Response:** Enter **ZRECP PROTECT** or **ZRECP IGNORE** to protect or bypass the protection of erroneously available addresses.

See *TPF Operations* for more information about the ZRECP RESUME, ZRECP RERUN, ZRECP PROTECT, and ZRECP IGNORE commands.

**BCP00011I RECOUP PROTECTION OF ERRONEOUS AVAILABLE STARTED**

**Explanation:** This is the normal response to the ZRECP PROTECT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROTECT command.

**BCP00012I RECOUP PROTECTION OF ERRONEOUS AVAILABLE COMPLETE**

**Explanation:** This is the normal response to the ZRECP PROTECT command indicating that erroneously available address protection is completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROTECT command.

**BCP00013I RECOUP 'DURING' PHASE 1 RELEASE PASS STARTED**

**Explanation:** This is the normal response to the ZRECP PROTECT or ZRECP IGNORE command indicating that the release step for phase 3 of recoup has started.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROTECT and ZRECP IGNORE commands.

**BCP00014I RECOUP 'DURING' PHASE 1 RELEASE PASS COMPLETE**

**Explanation:** This is the normal response to the ZRECP PROTECT or ZRECP IGNORE command indicating that the release step for phase 3 of recoup has completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROTECT and ZRECP IGNORE commands.

**BCP00015I RECOUP BUILD LOST ADDRESSES STARTED**

**Explanation:** This is the normal response to the ZRECP PROTECT or ZRECP IGNORE command indicating that the lost address step for phase 3 of recoup has started.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROTECT and ZRECP IGNORE commands.

**BCP00016I RECOUP BUILD LOST ADDRESSES COMPLETE**

**Explanation:** This is the normal response to the ZRECP PROTECT or ZRECP IGNORE command indicating that the lost address step for phase 3 of recoup has completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROTECT and ZRECP IGNORE commands.

**BCP00017A RECOUP BUILD LOST ADDR EXCLUSION TABLE NOW AND REBUILD DIRECTORIES OTHERWISE ENTER ZRECP NOREBUILD TO CONTINUE**

**Explanation:** This is the normal response to the ZRECP PROTECT or ZRECP IGNORE command indicating that the recoup lost address step has completed and recoup is waiting for a response to continue or to rebuild the directories.

**System Action:** None.

**User Response:** Do one of the following:

- Rebuild the directories as follows:
  1. If you want to add a record ID to the inclusion or exclusion table, enter the ZRECP ADD command
  2. Enter **ZRECP REBUILD** to rebuild the directories and continue recoup.
- Enter **ZRECP NOREBUILD** to bypass rebuilding the directories and continue recoup.

See *TPF Operations* for more information about the ZRECP ADD, ZRECP REBUILD, ZRECP NOREBUILD, ZRECP PROTECT, and ZRECP IGNORE commands.

**BCP00018I RECOUP PROTECTION OF ERRONEOUS AVAILABLE SKIPPED**

**Explanation:** This is the normal response to the ZRECP IGNORE command indicating that erroneously available address protection was skipped during phase 3 of recoup.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP IGNORE command.

**BCP00019A DESTRUCTIVE SEGMENT RESPOND ENTER ZRECP PROCEED TO ROLLIN OR ZRECP SKIP/ZRECP ABORT TO BYPASS ROLLIN**

**Explanation:** This is the normal response to the ZRECP REBUILD, ZRECP NOREBUILD, or ZRECP IGNORE command after the rebuild is run or skipped during phase 3 of recoup.

**System Action:** None.

**User Response:** Do one of the following:

- Enter **ZRECP PROCEED** to continue with the rollin.
- Enter **ZRECP SKIP** to bypass the rollin.

- Enter **ZRECP ABORT** to abort recoup.

See *TPF Operations* for more information about the ZRECP PROCEED, ZRECP SKIP, ZRECP ABORT, ZRECP REBUILD, ZRECP NOREBUILD, and ZRECP IGNORE commands.

---

**BCP00020I RECOUP BACKUP OF SONUP STARTED**

**Explanation:** This is the normal response to the ZRECP PROTECT or ZRECP IGNORE command indicating that directories are being manipulated at the start of recoup phase 3 rollin.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROTECT and ZRECP IGNORE commands.

---

**BCP00021I RECOUP BACKUP OF SONUP COMPLETE**

**Explanation:** This is the normal response to the ZRECP PROTECT or ZRECP IGNORE command indicating that the manipulation of the directories is completed at the start of recoup phase 3 rollin.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROTECT and ZRECP IGNORE commands.

---

**BCP00022I RECOUP RESTORE OF SONUP STARTED**

**Explanation:** This is the normal response when RESTART is entered during the lost address pass of phase 3 of recoup.

**System Action:** None.

**User Response:** None.

---

**BCP00023I RECOUP RESTORE OF SONUP COMPLETE**

**Explanation:** This is the normal response when the backup is completed after entering RESTART during the lost address pass of recoup phase 3.

**System Action:** None.

**User Response:** None.

---

**BCP00024I RECOUP PSEUDO DIRECTORY CREATE/ROLLIN RESTARTED**

**Explanation:** This is the normal response when recoup phase 3 has been restarted.

**System Action:** None.

**User Response:** None.

---

**BCP00025A RECOUP REBUILD INCORRECT ADR TAPE OPTION SPECIFIED OR EA/LA MAX POOL LIMIT EXCEEDED OR THE SYSTEM IS IN 1052 STATE UPDATE OPTION TABLE AND RESTART OTHERWISE ENTER ZRECP NOREBUILD TO CONTINUE**

**Explanation:** The ZRECP REBUILD command was entered, but one of the following conditions exist:

- Recoup runtime options were set to log items to the ADR tape.
- The number of erroneously available or lost pool addresses exceeds the number that was set in the recoup options table.

**System Action:** None.

**User Response:** Do one of the following:

- Enter **ZRECP NOREBUILD** to bypass rebuilding recoup rollin directories.
- Enter the ZRECP PROFILE command to log items to a file instead of the ADR tape.
- Increase pool limits and restart recoup phase 3 as follows:
  1. Enter the ZRECP PROFILE command to increase the pool limit in the option table.
  2. Enter **ZRECP RERUN** to restart recoup phase 3 processing from the beginning.

See *TPF Operations* for more information about the ZRECP NOREBUILD, ZRECP PROFILE, and ZRECP RERUN commands.

---

**BCP00026A EA/LA MAX POOL LIMIT EXCEEDED UPDATE OPTION TABLE AND RESTART**

**Explanation:** The ZRECP PROTECT or ZRECP IGNORE command was entered, but the erroneously available or lost addresses maximum has been exceeded.

**System Action:** None.

**User Response:** Increase pool limits and restart recoup phase 3 as follows:

-
  1. Enter the ZRECP PROFILE command to increase the pool limit in the option table.
  2. Enter **ZRECP RERUN** to restart recoup phase 3 processing from the beginning.

See *TPF Operations* for more information about the ZRECP PROTECT, ZRECP IGNORE, ZRECP PROFILE, and ZRECP RERUN commands.

---

**BCP00027I RECOUP ERRONEOUS AVAILABLE NOT CREATED**

**Explanation:** This is the normal response to the ZRECP PROTECT and ZRECP IGNORE commands when there are no erroneously available addresses.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROTECT and ZRECP IGNORE commands.

**BCP00028I RECOUP SONRI ROLLIN STARTED**

**Explanation:** This is the normal response to the ZRECP PROCEED command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROCEED command.

**BCP00029I RECOUP SONRI ROLLIN COMPLETE**

**Explanation:** This is a normal response to the ZRECP PROCEED command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROCEED command.

**BCP00031I RECOUP VFA FLUSH ERROR - RECOUP CONTINUING**

**Explanation:** The ZRECP RERUN command was entered, but virtual file access (VFA) flush processing returned from the BOFF segment with an error.

**System Action:** Recoup processing continues.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

See *TPF Operations* for more information about the ZRECP RERUN command.

**BCP00032I RECOUP -- SEQUENCE ERROR**

**Explanation:** The ZRECP REBUILD command was entered, but recoup is not active.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP REBUILD command.

**BCP00033W RECOUP ROLLIN DIRECTORIES NOT CREATED**

**Explanation:** The ZRECP REBUILD command was entered, but rollin pseudo directories were not created.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP REBUILD command again.

See *TPF Operations* for more information about the ZRECP REBUILD command.

**BCP00034I RECOUP LOST ADDRESS REBUILD STARTED**

**Explanation:** This is the normal response to the ZRECP REBUILD command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP REBUILD command.

**BCP00035I RECOUP LOST ADDRESS REBUILD COMPLETE**

**Explanation:** This is the normal response to the ZRECP REBUILD and ZRECP NOREBUILD commands.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP REBUILD and ZRECP NOREBUILD commands.

**BCP00036I WAITING FOR LOST ADDR REBUILD**

**Explanation:** This is the normal response to the ZRECP REBUILD and ZRECP NOREBUILD commands.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP REBUILD and ZRECP NOREBUILD commands.

**BCP00038I WAITING FOR PROTECT/IGNORE**

**Explanation:** This is the normal response to the ZRECP REBUILD and ZRECP NOREBUILD commands.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP REBUILD and ZRECP NOREBUILD commands.

**BCP00039I RECOUP GFS ACTIVITY ADD IN PROGRESS**

**Explanation:** This is a normal response to the ZRECP STATUS command indicating that recoup processing is adding records to the recoup rollin directory (#SONROLL).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command.

**BCP00040I RECOUP 'PRE' PHASE 1 RELEASE PASS IN PROGRESS**

**Explanation:** This is a normal response to the ZRECP STATUS command indicating that the recoup pre-release step for phase 4 pool directory update (PDU) creation is in progress.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command.

---

**BCP00041I RECOUP BUILD ERRONEOUS AVAILABLE IN PROGRESS**

**Explanation:** This is a normal response to the ZRECP STATUS command indicating that erroneously available addresses are being collected in recoup phase 3.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command.

---

**BCP00042I RECOUP PROTECT ERRONEOUS AVAILABLE IN PROGRESS OR WAITING FOR PROTECT/IGNORE**

**Explanation:** The ZRECP STATUS command was entered and one of the following conditions exist:

- Recoup is in the process of protecting erroneously available addresses.
- Recoup processing has protected erroneously available addresses and is waiting for the ZRECP PROTECT or ZRECP IGNORE command to be entered.

**System Action:** None.

**User Response:** If recoup processing is waiting for the ZRECP PROTECT or ZRECP IGNORE command to be entered, do one of the following:

- Enter **ZRECP PROTECT** to protect pool addresses that were marked as erroneously available during recoup phase 1 from being used by the TPF system by removing them from online pool directories.
- Enter **ZRECP IGNORE** to continue recoup processing when there are no erroneously available addresses to protect.

See *TPF Operations* for more information about the ZRECP STATUS, ZRECP PROTECT, and ZRECP IGNORE commands.

---

**BCP00043I RECOUP DURING RECOUP RELEASE PASS IN PROGRESS**

**Explanation:** This is a normal response to the ZRECP STATUS command indicating that the processing of addresses released during recoup is in progress in phase 3.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command.

---

**BCP00044I RECOUP BUILD LOST ADDRESSES IN PROGRESS**

**Explanation:** This is a normal response to the ZRECP STATUS command indicating that the process of building lost addresses is in progress in recoup phase 3.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command.

---

**BCP00045I RECOUP REBUILD OF LOST ADDRESSES IN PROGRESS OR WAITING FOR LOST ADDRESS REBUILD**

**Explanation:** The ZRECP STATUS command was entered and one of the following conditions exist:

- Recoup is in the process of rebuilding lost addresses.
- Recoup processing has completed lost address processing and is waiting for you to begin rebuild processing.

**System Action:** None.

**User Response:** If recoup processing is waiting for you to begin rebuild processing, do one of the following:

- Rebuild the directories as follows:
  1. If you want to add a record ID to the inclusion or exclusion table, enter the ZRECP ADD command.
  2. Enter **ZRECP REBUILD** to rebuild the directories and continue recoup.
- Enter **ZRECP NOREBUILD** to bypass rebuilding the directories and continue recoup.

See *TPF Operations* for more information about the ZRECP STATUS, ZRECP REBUILD, and ZRECP NOREBUILD commands.

---

**BCP00046I RECOUP SONRI ROLLIN IN PROGRESS**

**Explanation:** This is a normal response to the ZRECP STATUS command indicating that the rollin to the pool rollin directory (#SONRI) is running in recoup phase 3.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command.

---

**BCP00047I RECOUP REMOVAL OF CAPTURE2 FROM ROLLIN STARTED**

**Explanation:** This is the normal response to the ZRECP PROCEED command indicating that the capture from the rollin directories is being removed to allow for a complete merge into the pool rollin directory (#SONRI).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROCEED command.

---

**BCP00048I RECOUP REMOVAL OF CAPTURE2 FROM ROLLIN COMPLETE**

**Explanation:** This is the normal response to the ZRECP PROCEED command indicating that the capture from the rollin directories has been removed to allow for a complete merge into the pool rollin directory (#SONRI).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROCEED command.

---

**BCP00049I RECOUP REMOVAL OF CAPT2 FROM ROLLIN IN PROGRESS OR WAITING FOR PROCEED/SKIP/ABORT**

**Explanation:** The ZRECP STATUS command was entered and one of the following conditions exist:

- Recoup is in the process of rolling in pool files to the pool rollin directory (#SONRI) using the recoup rollin directory (#SONROLL).
- Recoup processing has completed rebuild processing and is waiting for you to begin rollin processing.

**System Action:** None.

**User Response:** If recoup processing is waiting for you to begin rollin processing, do one of the following:

- Enter **ZRECP PROCEED** to continue with the recoup phase 3 rollin.
- Enter **ZRECP SKIP** to bypass the recoup phase 3 rollin.
- Enter **ZRECP ABORT** to abort recoup.

See *TPF Operations* for more information about the ZRECP STATUS, ZRECP PROCEED, ZRECP SKIP, and ZRECP ABORT commands.

---

**BCP00050E RECOUP GFS ACTIVITY CALCULATION ERROR PROCEED WITH CAUTION**

**Explanation:** The ZRECP REBUILD command was entered, but the BCP6 segment, which calculates the get file storage (GFS) counts, returned to the BCP0 segment with a GFS count error condition.

**System Action:** The GFS activity calculation function ends with an error.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP REBUILD command again.

See *TPF Operations* for more information about the ZRECP REBUILD command.

---

**BCP00051I RECOUP LOST ADDRESS REBUILD PROCESS NOT COMPLETE**

**Explanation:** This is a normal response to the ZRECP REBUILD command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP REBUILD command.

---

**BCP00052A EA/LA MAX POOL LIMIT EXCEEDED UPDATE ZRECP PROFILE EALOSTMAX AND THEN ENTER ZRECP RESTART FOLLOWED BY ZRECP REBUILD**

**Explanation:** The erroneously available addresses (EA) or lost addresses (LA) that were found during recoup processing, exceeds the maximum number allowed by recoup runtime options.

**System Action:** The TPF system waits for a response.

**User Response:** Do the following:

1. Enter the ZRECP PROFILE command to update your recoup runtime options.
2. Enter the ZRECP RESTART command to start recoup processing again.
3. Enter the ZRECP REBUILD.

See *TPF Operations* for more information about the ZRECP PROFILE, ZRECP RESTART, and ZRECP REBUILD commands.

---

**BCP00053I RECOUP RERUN INCORRECT AT THIS TIME PSEUDO DIRECTORY CREATE IS ACTIVE OR DIRECTORY ROLLIN HAD ALREADY BEGUN**

**Explanation:** The ZRECP RERUN command was entered, but recoup pseudo directory (#SONRPE) creation is active or directory rollin has already started.

**System Action:** The command is rejected.

**User Response:** Determine why the ZRECP RERUN command was entered.

See *TPF Operations* for more information about the ZRECP RERUN command.

---

**BCP00054I RECOUP REBUILD INCORRECT - REBUILD ALREADY DONE**

**Explanation:** The ZRECP REBUILD command was entered, but a ZRECP REBUILD command has already completed.

**System Action:** The command is rejected.

**User Response:** Determine why the ZRECP REBUILD command was entered twice.

See *TPF Operations* for more information about the ZRECP REBUILD command.

---

**BCP00055I RECOUP RESTART INCORRECT - SEL/EXC ROLLIN IN PROGRESS RECOUP MUST BE ABORTED**

**Explanation:** Cannot restart recoup because of SEL/EXC rollin indicator set.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Abort recoup.
2. Determine the cause of the problem.
3. Correct the problem.
4. Start recoup again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BCP10001E RECOUP FACE ERROR E80/L80 PRIME. FIX AND RESTART FACE TYPE** *facetype* **ORDINAL HEX** *hexord*

**Where:**

*facetype*
A FACE table record type of E80E8 or L80L8.

*hexord*
The ordinal number of an erroneously available addresses (E80E8) or lost addresses (L80L8) record.

**Explanation:** During recoup processing, an error condition was detected by a FACE-type call while trying to retrieve the retrieve the E80E8 record or the L80L8 record.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BCP10001I RECOUP** *addrcnt* **TOTAL** *addrtyp* **ADDRESSES**

**Where:**

*addrcnt*
The total number of lost or erroneously available addresses.

*addrtyp*
The type of addresses (LOST or ERRONEOUSLY AVAILABLE).

**Explanation:** This is a normal message during recoup processing that shows the total number of lost or erroneously available addresses found during chain chase processing.

**System Action:** None.

**User Response:** None.

---

**BCP10002E RECOUP FIND/FILE ERROR E80/L80 PRIME. FIX AND RESTART FARW =** *farw*

**Where:**

*farw*
The file address reference word that is used to read the record.

**Explanation:** During recoup processing, a FIND/FILE error condition was detected while trying to retrieve the erroneously available addresses (E80E8) record or the lost addresses (L80L8) record.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BCP10003E RECOUP FACE ERROR EA/LA PSEUDO DIRECTORY FIX AND RESTART FACE TYPE** *facetype* **ORDINAL HEX** *hexord*

**Where:**

*facetype*
The FACE table record type of a recoup pseudo directory (#SONRPE) record.

*hexord*
The ordinal number of a recoup pseudo directory (#SONRPE) record.

**Explanation:** During recoup processing, an error condition was detected by a FACE-type call while trying to retrieve the recoup pseudo directory (#SONRPE).

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BCP10004E RECOUP FIND ERROR EA/LA PSEUDO DIRECTORY FIX AND RESTART FARW =** *farw*

**Where:**

*farw*
The file address reference word that is used to read the record.

**Explanation:** During recoup processing, an error condition was detected by a FINWC macro while trying to retrieve the recoup pseudo directory (#SONRPE).

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF General Macros* for more information about the FINWC macro. See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BCP10005E RECOUP FIND/FILE ERROR E80/L80. FIX AND RESTART FARW =** *farw*

**Where:**

*farw*
The file address reference word that is used to read the record.

**Explanation:** During recoup processing, a FIND/FILE error condition was detected while trying to retrieve the erroneously available addresses (E80E8) record or the lost addresses (L80L8) record.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BCP10006E RECOUP EA/LA REPORT PROCESS TIME OUT. FIX AND RESTART**

**Explanation:** Created entry control block (ECB), has run out of time or has failed.

**System Action:** Exit the TPF system.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BCP10007E RECOUP STOPPED**

**Explanation:** Several errors caused recoup processing to stop. Possible causes are main entry control block (ECB) FACE-type call errors, find or file errors, other FACE-type call errors, ECB time-outs or failures, or other errors.

**System Action:** Recoup processing stops.

**User Response:** Do the following:

1. Determine the cause of the problems.
2. Correct the problems.
3. Start recoup again.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BCP10008E RECOUP LOST/EA RECORD FIND ERROR. PROCESS CONTINUES FARW =** *farw*

**Where:**

*farw*
The file address reference word that is used to read the record.

**Explanation:** During recoup processing, an error condition was detected by the FINWC macro while trying to retrieve the lost address record or erroneously available record.

**System Action:** Recoup processing continues.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

See *TPF General Macros* for more information about the FINWC macro.

---

**BCP10009E RECOUP FIND ERROR E80/L80. FIX AND RESTART FARW =** *farw*

**Where:**

*farw*
The file address reference word that is used to read the record.

**Explanation:** During recoup processing, an error condition was detected by the FINWC macro while trying to retrieve the erroneously available addresses (E80E8) record or the lost addresses (L80L8) record.

**System Action:** Exit the TPF system.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF General Macros* for more information about the FINWC macro. See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BCP10010E RECOUP LOST/EA POOL ADDRESS CONVERSION ERROR. PROCESS CONTINUES FACE TYPE** *facetype* **ORDINAL HEX** *hexord*

**Where:**

*facetype*
The file address compute (FACE) program table record type of a recoup pseudo directory (#SONRPE) record.

*hexord*
The ordinal number of an recoup pseudo directory (#SONRPE) record.

**Explanation:** Recoup processing was unable to convert the 4-byte file address, which was obtained by the pool record type from the PDSCA (pool directory set control area), and the current pool ordinal into an 8-byte character string.

**System Action:** Recoup processing continues.

**User Response:** Determine the cause of the problem.

---

**BCP10013E BCP1 MOUNT ADR TAPE FOR OUTPUT**

**Explanation:** Recoup processing required an output ADR tape and none is mounted.

**System Action:** Recoup processing waits for an ADR tape to be mounted.

**User Response:** Mount an output ADR tape.

---

**BCP10015I NO 1K POOL AVAILABLE, ADR WILL BE USED**

**Explanation:** While building the erroneously available or lost address file from a pseudo directory, recoup processing determined that there were no large duplicated (LDP) or large long-term (LLT) pool records available to store the file.

**System Action:** Erroneously available and lost addresses are written to the ADR tape.

**User Response:** None.

---

**BCP10016I RECOUP** *cnt* **TOTAL** *addrtype* **ADDRESSES**

**Where:**

*cnt* The total number of addresses.

*addrtype*
The type of addresses: erroneously available or lost.

**Explanation:** This is a normal response that occurs at the end of recoup phase 3 processing.

**System Action:** None.

**User Response:** None.

---

**BCP20001E RECOUP SONRI ROLLIN TIMEOUT - FIX AND RESTART**

**Explanation:** Recoup has determined that an entry control block (ECB) has not completed in the allowed time or there was an error copying the pool rollin directory (#SONRI).

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BCP20002E RECOUP SONRI ROLLIN FACE ERROR - FIX AND RESTART FACE TYPE** *facetype* **ORDINAL HEX** *hexord*

**Where:**

*facetype*
The FACE table record type of a recoup pseudo directory (#SONRPE) record.

*hexord*
The ordinal number of the pool rollin directory (#SONRI) record.

**Explanation:** During recoup processing, an error condition was detected by a FACE-type call while trying to retrieve the #SONRI record.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BCP20003E RECOUP SONRI ROLLIN ORDINAL ERROR - FIX AND RESTART FACE TYPE** *facetype* **ORDINAL HEX** *hexord*

**Where:**

*facetype*
The file address compute (FACE) program table record type.

*hexord*
The ordinal number of a record.

**Explanation:** Pseudo directory ordinal number mismatch.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

---

**BCP20004E RECOUP PSEUDO DIRECTORY ERROR - FIX AND RESTART FARW =** *farw*

**Where:**

*farw*
The file address reference word that is used to read the record.

**Explanation:** An error condition was detected by the FINWC macro while trying to retrieve or the FILNC macro while trying to file the recoup pseudo directory (#SONRPE) record.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start the function again.

See *TPF General Macros* for more information about the FINWC and FILWC macros.

---

**BCP20005E RECOUP KP9 HOLD/UNHOLD ERROR - FIX AND RESTART**

**Explanation:** A find error condition was detected on keypoint 9 on return from the CYYM segment or a file error condition was detected on keypoint 9 on return from the CYYA segment.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start the function again.

---

**BCP20008I DIRECTORY UPDATE/KEYPOINT 9 UPDATE COMPLETE**

**Explanation:** This is the normal response to the ZRECP PROCEED command or to the ZDUPD command with the C parameter specified, indicating that directory update or keypoint 9 update processing ends without an error.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROCEED command.

---

**BCP30001E RECOUP EA/LA TABLE COUNTS FIND ERROR FARW =** *farw*

**Where:**

*farw*
The file address reference word that is used to find the record.

**Explanation:** During recoup processing that creates a file containing counts of lost and erroneously available records, an error condition was detected by the FIHWC macro while trying to find the erroneously available addresses table (#BREATB8) or the lost addresses table (#BRLOTB8).

**System Action:** Lost and erroneously available record counts are not calculated.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

See *TPF General Macros* for more information about the FIHWC macro.

---

**BCP30002E RECOUP EA/LA TABLE COUNTS FACE ERROR FACE TYPE** *facetype* **ORDINAL HEX** *hexord*

**Where:**

*facetype*
The erroneously available addresses table (#BREATB8) or lost addresses table (#BRLOTB8) FACE table record type.

*hexord*
The ordinal number of the FACE table record.

**Explanation:** During recoup processing that creates a file containing counts of lost and erroneously available records, an error condition was detected by a FACE-type call while trying to find the erroneously available addresses table (#BREATB8) or lost addresses table (#BRLOTB8).

**System Action:** Lost and erroneously available record counts are not calculated.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**BCP60002E FIND/FACE ERROR READING DIRECTORY RECORD**

**Explanation:** During recoup processing to determine get file storage (GFS) activity and pseudo directory counts, an error condition was detected by the FINWC macro or a FACE-type call while trying to read the directory record.

**System Action:** Get file storage (GFS) activity and pseudo directory counts are not calculated correctly.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF General Macros* for more information about the FINWC macro.

# BKA0–BMS8

---

**BKA00010E SELECTIVE RECOUP ALREADY ACTIVE**

**Explanation:** The ZRECP SEL command was entered, but selective recoup is already active.

**System Action:** The command is rejected.

**User Response:** Wait until this selective chain chase is completed before running another one.

See *TPF Operations* for more information about the ZRECP SEL command.

---

**BKA10001E ERROR RETRIEVING ERROR INFO FROM RECOUP ONEL, RE-ENTER SAME ZRECP SEL COMMAND TO OVERRIDE THIS ERROR**

**Explanation:** The ZRECP SEL command was entered with a record ID and file address specified, but TPF recoup processing failed while accessing the SRCK1P file.

**System Action:** Selective recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP SEL command again.

See *TPF Operations* for more information about the ZRECP SEL command.

---

**BKA10002A FIXED/TIMEOUT ERROR NOT FOUND - CHECK INPUT, OR RE-ENTER SAME ZRECP SEL COMMAND TO OVERRIDE THIS WARNING**

**Explanation:** The ZRECP SEL command was entered specifying a record ID that chain chased without any fixed or timeout errors.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the command to make sure you specified the correct record ID.
2. Enter the ZRECP SEL command again specifying the correct record ID.

See *TPF Operations* for more information about the ZRECP SEL command.

**BKA10003A NO ERRORS WITH THAT ID - CHECK INPUT, OR RE-ENTER SAME ZRECP SEL COMMAND TO OVERRIDE THIS WARNING**

**Explanation:** The ZRECP SEL command was entered specifying a record ID that chain chased without errors.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the command to make sure you specified the correct record ID.
2. Enter the ZRECP SEL command again specifying the correct record ID.

See *TPF Operations* for more information about the ZRECP SEL command.

**BKA10004W 1052 STATE - ONLINE LOG NOT CHANGED**

**Explanation:** The ZRECP SEL command was entered with a record ID and file address specified, but TPF recoup processing was unable to remove the record ID from the SRCK1P file because the TPF system was in 1052 state.

**System Action:** Selective recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP SEL command again.

See *TPF Operations* for more information about the ZRECP SEL command.

**BKC10013W MOUNT ADR TAPE FOR INPUT**

**Explanation:** The TPF system is processing a function that requires an ADR tape, but an ADR tape is not mounted.

**System Action:** None.

**User Response:** Mount the ADR tape.

**BKC10014E RECP SELD RESTART NOT ALLOWED FOR ONLINE OPTION**

**Explanation:** The ZRECP DUMP command was entered specifying the RESTART parameter but recoup runtime options were not set to use the ADR tape.

**System Action:** The command is rejected.

**User Response:** Enter **ZRECP DUMP** without specifying the RESTART parameter to start recoup phase 5 from the beginning.

See *TPF Operations* for more information about the ZRECP DUMP command.

**BKP60001I FC33 LOGGING RECORDS SWITCHED**

**Explanation:** This is a normal response to the ZRECP RECALL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RECALL command.

**BKP60002E UNABLE TO SWITCH @BLOG ORDINAL**

**Explanation:** The ZRECP RECALL command was entered, but recoup processing was unable to switch the @BLOG ordinal.

**System Action:** None.

**User Response:** Do the following:

1. Enter the following:
   a. **ZRECP ABORT BP**
   b. **ZRPDU CREATE NOSWITCH**
   c. **ZDUPD S**
   d. **ZDUPD C**
   e. **ZRREC RESET**
2. Start recoup processing again.

See *TPF Operations* for more information about the ZRECP RECALL, ZRECP ABORT, ZRPDU CREATE, ZDUPD, and ZRREC RESET commands.

**BKP60003E ***** RECOUP MUST BE ABORTED *****

**Explanation:** The ZRECP RECALL command was entered, but processing was unable to switch the released pool address (FC33) and RTA tapes on the active secondary processor.

**System Action:** Recoup processing is stopped internally.

**User Response:** Do the following:

1. Enter the following commands:
   a. **ZRPDU CREATE NOSWITCH**
   b. **ZDUPD S**
   c. **ZDUPD C**
   d. **ZRREC RESET**
2. Start recoup processing again.

See *TPF Operations* for more information about the ZRECP RECALL, ZRPDU CREATE, ZDUPD, and ZRREC RESET commands.

---

**BKP60004E TIMEOUT OCCURRED TRYING TO SWITCH @BLOG ORDINALS ON ACTIVE SECONDARY PROCESSOR**

**Explanation:** The ZRECP RECALL command was entered, but no response was received within the 3-minute time limit from an active secondary processor while trying to switch @BLOG ordinals on that processor.

**System Action:** Recoup processing is stopped internally.

**User Response:** Do the following:

1. Enter the following commands:
   a. **ZRPDU CREATE NOSWITCH**
   b. **ZDUPD S**
   c. **ZDUPD C**
   d. **ZRREC RESET**
2. Start recoup processing again.

See *TPF Operations* for more information about the ZRECP RECALL, ZRECP ABORT, ZRPDU CREATE, ZDUPD, and ZRREC RESET commands.

---

**BKP60005E UNABLE TO SWITCH @BLOG ORDINALS ON CPU-*cpuid***

**Where:**

*cpuid*
The name of the processor.

**Explanation:** The ZRECP RECALL command was entered, but all @BLOG ordinals on the processor shown in the message are in use and could not be switched.

**System Action:** Recoup processing is stopped internally.

**User Response:** Do the following:

1. Enter the following commands:
   a. **ZRPDU CREATE NOSWITCH**
   b. **ZDUPD S**
   c. **ZDUPD C**
   d. **ZRREC RESET**
2. Start recoup processing again.

See *TPF Operations* for more information about the ZRECP RECALL, ZRPDU CREATE, ZDUPD, and ZRREC RESET commands.

---

**BKP60006E UNDEFINED ERROR RETURNED FROM POSTC WHILE SWITCHING @BLOG ORDINALS ON ACTIVE SECONDARY PROCESSOR**

**Explanation:** The ZRECP RECALL command was entered, but an error code was returned from an active secondary processor that was not recognized by the primary processor. This occurred while trying to switch @BLOG ordinals on the active secondary processor.

**System Action:** Recoup processing is stopped internally.

**User Response:** Do the following:

1. Enter the following commands:
   a. **ZRPDU CREATE NOSWITCH**
   b. **ZDUPD S**
   c. **ZDUPD C**
   d. **ZRREC RESET**
2. Start recoup processing again.

See *TPF Operations* for more information about the ZRECP RECALL, ZRPDU CREATE, ZDUPD, and ZRREC RESET commands.

---

**BKP60007E ERROR OCCURRED WAITING FOR TPFCS POOL REUSE TABLE TO BE CLEARED ON ALL ACTIVE PROCESSORS**

**Explanation:** The ZRECP RECALL command was entered, but a timeout or other error occurred while waiting for another active processor in the complex to successfully clear the TPF collection support (TPFCS) pool reuse table.

**System Action:** Message RECP0668E may have been issued on another processor in the complex. Recoup processing is stopped internally.

**User Response:** Do the following:

1. Examine the console logs to determine if message RECP0668E has been issued on another processor in the complex. If message RECP0668E has been issued, see the user response for that message for more information.
2. Start recoup processing again.

See *TPF Operations* for more information about the ZRECP RECALL command. See *Messages (Online)* for more information about message RECP0668E.

---

**BLOG0001W ALL FC33 ORDINALS IN USE - RUN ZRPDU WITH NO SWITCH**

**Explanation:** The ZRPDU CREATE, ZRREC SWITCH, or ZRECP RECALL command was entered, but all released pool address (FC33) ordinals are in use.

**System Action:** The command fails.

**User Response:** Enter the following:

1. **ZRPDU CREATE NOSWITCH**
2. **ZDUPD S**
3. **ZDUPD C**
4. **ZRREC RESET**

See *TPF Operations* for more information about the ZRPDU CREATE, ZRREC SWITCH, ZDUPD, ZRREC RESET, and ZRECP RECALLcommands.

---

**BLOG0002I UNABLE TO SWITCH FC33 ORDINAL NUMBERS**

**Explanation:** The ZRPDU CREATE command was entered, but processing cannot switch the released pool address (FC33) ordinal numbers.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRPDU CREATE command again.

See *TPF Operations* for more information about the ZRPDU CREATE command.

---

**BLOG0003E FC33 RECORDS SWITCHED DURING CYCLE UP - FIND ERROR ON PREVIOUS RECORD.**

**Explanation:** During a TPF system cycle up or restart, an error condition was detected by the FINWC macro while trying to retrieve the last keypointed released pool address (FC33) record.

**System Action:** None.

**User Response:** Enter the ZRPDU CREATE command again, specifying any parameters that were previously specified before the TPF system cycled up, because FC33 records do not contain correct data.

See *TPF Operations* for more information about the ZRPDU CREATE command. See *TPF General Macros* for more information about the FINWC macro.

---

**BLOG0004W GFS NOT ACTIVE AT THIS TIME**

**Explanation:** During a TPF system cycle up or restart, get file storage (GFS) is not active.

**System Action:** The TPF system files the released pool address (FC33) record but does not complete any ZRPDU CREATE processing that was in progress.

**User Response:** Enter the ZRPDU CREATE command again, specifying any parameters that were previously specified before the TPF system cycled up.

See *TPF Operations* for more information about the ZRPDU CREATE command.

---

**BLOG0005W ERROR FILING POOL CONTROL AREA**

**Explanation:** During a TPF system cycle up or restart, an error condition was detected by the FILNC macro while trying to file the recoup global.

**System Action:** None.

**User Response:** Enter the ZRPDU CREATE command again, specifying any parameters that were previously specified before the TPF system cycled up because the recoup global does not contain correct information.

See *TPF Operations* for more information about the ZRPDU CREATE command. See *TPF General Macros* for more information about the FILNC macro.

---

**BLOG0006I FC33 ORDINALS HAVE BEEN MADE AVAILABLE TO THIS PROCESSOR, MOST POOLS PREVIOUSLY RELEASED MAY NOW BE LOST**

**Explanation:** This is a normal response to the ZRREC RESET command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRREC RESET command.

---

**BLOG0007I AN FC33 ORDINAL HAS BEEN MADE AVAILABLE TO THIS PROCESSOR; SOME POOLS PREVIOUSLY RELEASED MAY NOW BE LOST**

**Explanation:** This is a normal response to the ZRREC BACKUP command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRREC BACKUP command.

---

**BLOG0008W ERROR ON FC33 FILE DOWN, FC33 WILL BE RE-CHAINED**

**Explanation:** During a TPF system cycle up or restart, an error condition was detected by the FILNC macro while trying to file the released pool address (FC33) record.

**System Action:** None.

**User Response:** None.

See *TPF General Macros* for more information about the FILNC macro.

---

**BLOH0001W ALL FC33 ORDINALS IN USE - TO CONTINUE RUN ZRPDU CREATE NOSWITCH, ZDUPD S, ZDUPD C AND ZRREC RESET**

**Explanation:** The ZRECP RECALL, ZRPDU CREATE, or ZRREC SWITCH command was entered, but all FC33 (index into the CA records) ordinals are in use.

**System Action:** The command fails.

**User Response:** Do the following:

1. If recoup processing was running, enter **ZRECP ABORT BP**.
2. Enter the following:
   a. **ZRPDU CREATE NOSWITCH**
   b. **ZDUPD S**
   c. **ZDUPD C**
   d. **ZRREC RESET**

See *TPF Operations* for more information about the ZRECP RECALL, ZRPDU CREATE, ZRREC SWITCH, ZDUPD, and ZRREC RESET commands.

---

**BMD10002E TAPE WRITE ERROR**

**Explanation:** The ZRECP DUMP command was entered, but was unable to write a TRACE or SELD record to the RTL tape.

**System Action:** The command fails to write this record, but continues on to the next.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP DUMP command again.

See *TPF Operations* for more information about the ZRECP DUMP command.

---

**BMS20001E BLOCK *xxx* NOT FOUND**

**Where:**

*xxx* The block number of the record read from the test unit tape (TUT).

**Explanation:** The block number specified in the ZSTVS START command was not found.

**System Action:** None.

**User Response:** Check that proper TUT was mounted.

---

**BMS20001I RUNID PROCESSING RESUMED AFTER PAUSE/STOP REQUEST**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

---

**BMS20001I RUNID PROCESSING RESUMED FROM CURRENT BLOCK AFTER PAUSE REQUEST**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

---

**BMS20003E NINES RECORD MISSING ON TUT**

**Explanation:** An error occurred because the test unit tape (TUT) is not formatted correctly so the program test vehicle (PTV) cannot run currently.

**System Action:** The TUT is dismounted and is closed.

**User Response:** Check the tape.

---

**BMS20004E**

**Explanation:** An error occurred because the test unit tape (TUT) is not formatted correctly so the program test vehicle (PTV) cannot run currently.

**System Action:** The TUT is dismounted and is closed.

**User Response:** Check the tape.

---

**BMS80000E TUT TAPE NOT RESERVED**

**Explanation:** The ZSTVS message processor tried to assign a test unit tape (TUT) but the TUT was not reserved.

**System Action:** None.

**User Response:** Do the following:

1. Reset the program test vehicle (PTV).
2. IPL the test TPF system.

---

**BMS80004E TUT TAPE NOT ASSIGNED — PROCESSING STOPPED**

**Explanation:** The ZSTVS message processor tried to read the test unit tape (TUT) but the TUT was not assigned.

**System Action:** None.

**User Response:** Do the following:

1. Reset the program test vehicle (PTV).
2. IPL the test TPF system.

---

**BMS80008E INVALID FORMAT — MESSAGE IGNORED**

**Explanation:** A ZSTVS command was entered incorrectly.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the ZSTVS command.
2. Enter the ZSTVS command again by using the correct format.

---

**BMS80012E INVALID MODE PARAMETER**

**Explanation:** The Mode parameter was specified incorrectly on the ZSTVS START command. The value specified on the Mode parameter must be A or B.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the ZSTVS command.
2. Enter the ZSTVS command again by using the correct format.

---

**BMS80016E STV NOT ACTIVE**

**Explanation:** A ZSTVS command that is valid only in the system test vehicle (STV) was entered, but STV is not active.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the ZSTVS command.
2. Start the program test vehicle (PTV) again, if necessary.

---

**BMS80020E STV CURRENTLY ACTIVE**

**Explanation:** There was an attempt to start the program test vehicle (PTV) when the system test vehicle (STV) was already active.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Pause PTV, if necessary.

---

**BMS80024E COMMANDS OUT OF SEQUENCE — RESET PTV**

**Explanation:** A ZSTVS command was entered at the wrong time.

**System Action:** None.

**User Response:** Enter the ZSTVS TEST RESET command to reset the program test vehicle (PTV).

**BMS80028E INVALID REQUEST — NOT IN NORM STATE — MESSAGE IGNORED**

**Explanation:** An attempt was made to start the system test vehicle (STV) when the TPF system was not in NORM state.

**System Action:** None.

**User Response:** Do the following:

1. Cycle the TPF system to NORM state.
2. Enter the command again.

**BMS80032E LIVE TEST ACTIVE — INVALID REQUEST — RESET ONLY VALID**

**Explanation:** A ZSTVS command was entered when the TPF system was in live mode rather than test mode.

**System Action:** None.

**User Response:** Reset the program test vehicle (PTV) by entering the ZSTVS TEST RESET command.

**BMS80036E PTV ALREADY ACTIVE**

**Explanation:** An attempt was made to start the program test vehicle (PTV) when PTV was already active.

**System Action:** None.

**User Response:** None.

**BMS80040E UNABLE TO RETRIEVE PTVA**

**Explanation:** The program test vehicle (PTV) keypoint could not be read.

**System Action:** None.

**User Response:** See your system programmer to determine the cause of the error and to correct it.

**BMS80044E SYSTEM NOT IN UNI MODE — PTV REQUEST IGNORED**

**Explanation:** The program test vehicle (PTV) runs only in a one I-stream single processor mode.

**System Action:** None.

**User Response:** Enter the ZCNIS UP command to make the TPF system a single I-stream.

**BMS80048E INVALID REQUEST — TEST NOT PAUSED — MESSAGE IGNORED**

**Explanation:** A ZSTVS START POSIT command was entered and the program test vehicle (PTV) was not paused.

**System Action:** None.

**User Response:** None.

**BMS80052E ZSTVS TEST MESSAGE ONLY VALID IN RESTART — ENTER ZRIPL**

**Explanation:** A ZSTVS TEST STV, ZSTVS TEST YES, or ZSTVS TEST LIVE command was entered, but the TPF system is not in restart.

**System Action:** None.

**User Response:** Enter the ZRIPL command to set the program test vehicle (PTV) phase. A ZSTVS TEST RESET command may be required to be prompted for the PTV phase.

# BOFA–BOF9

**BOFA0002E ONLINE PDU BUILD PROCESS CANNOT RUN WHILE RECOUP ACTIVE**

**Explanation:** The ZRPDU CREATE command was entered, but recoup is active. Online pool directory update (PDU) and recoup cannot run at the same time.

**System Action:** The command is rejected.

**User Response:** Determine why a pool directory update (PDU) was started when recoup was active.

See *TPF Operations* for more information about the ZRPDU CREATE command.

**BOFA0003E PDU ALREADY ACTIVE**

**Explanation:** The ZRPDU CREATE command was entered, but an online pool directory update (PDU) is already active.

**System Action:** The command is rejected.

**User Response:** Determine why a second PDU was started.

See *TPF Operations* for more information about the ZRPDU CREATE command.

**BOFA0006I PDU CA RELEASE ITEMS ALL PROCESSED**

**Explanation:** This is the normal response to the ZRPDU CREATE command when all release file storage (RFS) items in all the CA (CY6TR) logging records have been processed and added to the pseudo directories.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPDU CREATE command.

**BOFA0007I SWITCH FC33 LOGGING RECORDS COMPLETE**

**Explanation:** This is the normal response to the ZRREC SWITCH command indicating that released pool address (FC33) record switching has completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRREC SWITCH command.

**BOFA0009W PDU ABORT REQUESTED**

**Explanation:** This is the normal response to the ZRPDU ABORT command.

**System Action:** The TPF system stops processing a ZRPDU CREATE command that was previously entered.

**User Response:** None.

See *TPF Operations* for more information about the ZRPDU ABORT and ZRPDU CREATE commands.

**BOFA0011I ONLINE PDU CREATE FUNCTION STARTED**

**Explanation:** This is the normal response to the ZRPDU CREATE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPDU CREATE command.

**BOFA0013W FIND/FILE ERROR ON CA RECORD, PDU WILL CONTINUE**

**Explanation:** The ZRPDU CREATE command was entered, but an error condition was detected while trying to retrieve or file the CA record (CY6TR).

**System Action:** Pool directory update (PDU) continues processing.

**User Response:** None.

See *TPF Operations* for more information about the ZRPDU CREATE command.

**BOFA0014E PSEUDO DIRECTORIES ALREADY CREATED RUN PDU VERIFY OR ABORT CREATE AND RE-RUN**

**Explanation:** The ZRPDU CREATE command was entered, but pseudo directories were already created by a previous ZRPDU CREATE command.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- To verify the pseudo directories that were already created by the previous ZRPDU CREATE command, enter the ZDUPD command specifying the S parameter.
- To replace the current pseudo directories, do the following:
  1. Enter **ZRPDU ABORT**
  2. Enter **ZRPDU CREATE**

See *TPF Operations* for more information about the ZDUPD, ZRPDU ABORT, and ZRPDU CREATE commands.

**BOFA0015E PSEUDO DIRECTORIES ALREADY CREATED ROLL IN PDU/RECP BEFORE SWITCHING FC33 RECORDS**

**Explanation:** The ZRREC SWITCH command was entered, but a recoup or pool directory update (PDU) rollin has not been performed. A recoup or PDU rollin must be performed before released pool address (FC33) records can be switched.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Perform a recoup or pool directory update (PDU) rollin.
2. Enter the command again.

See *TPF Operations* for more information about the ZRREC SWITCH command.

**BOFA0016E PDU ABORT NOT VALID AT THIS TIME**

**Explanation:** The ZRPDU ABORT command was entered, but it was not allowed because of one of the following reasons:

- Pool directory update (PDU) is not active.
- New directories have not been created.
- PDU verification or rollin processing is running.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter **ZRPDU ABORT** again.

See *TPF Operations* for more information about the ZRPDU ABORT command and the ZDUPD command for more information about PDU verification and rollin processing.

**BOFA0017E RECOUP ACTIVE**

**Explanation:** A ZRPDU or ZRREC command was entered while recoup is active.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about ZRPDU and ZRREC commands.

**BOFA0018I ONLINE PDU DOUBLE RELEASES -** *duprel* **FC33 RECS PROCESSED -** *fc33proc* **CA RECS PROCESSED -** *caproc* **STATUS -** *statind* **(P=ACTIVE I=INACTIVE)**

**Where:**

*duprel*
The number of records that are released more than once during online pool directory update (PDU) processing.

*fc33proc*
The number of released pool address (FC33) records that are processed during online PDU processing.

*caproc*
The number of CA records that are processed during online PDU processing.

*statind*
The online PDU processing status indicator: active (P) or inactive (I).

**Explanation:** This is the normal response to the ZRPDU STATUS, ZRPDU CREATE, or ZRECP RECALL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPDU STATUS, ZRPDU CREATE, and ZRECP RECALL commands.

**BOFB0001I SELECT DATABASE PROTECTION STARTED**

**Explanation:** This is the normal response to the ZRECP PROTECT command specifying the SEL parameter, indicating that selective database protection has begun.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROTECT command.

**BOFB0002I SELECT DATABASE PROTECTION COMPLETE**

**Explanation:** This is the normal response to the ZRECP PROTECT command specifying the SEL parameter indicating that selective database protection has completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROTECT command.

**BOFB0003I SELECT DATABASE PROTECTION ABORTED**

**Explanation:** This is the normal response to the ZRECP ABORT command when selective database protection is running.

**System Action:** None.

**User Response:** If the ZRECP PROTECT command was aborted because of a possible error, do the following:

1. Fix the error.
2. Enter the ZRECP PROTECT command again.

See *TPF Operations* for more information about the ZRECP ABORT and ZRECP PROTECT commands.

**BOFB0004I INCORRECT INPUT MESSAGE SELECT DATABASE PROTECTION NOT ACTIVE**

**Explanation:** The ZRECP ABORT command was entered, but selective database protection is not active.

**System Action:** The command is rejected.

**User Response:** Determine why the ZRECP ABORT command was entered when selective database protection is not active.

See *TPF Operations* for more information about the ZRECP ABORT command.

**BOFB0005I INCORRECT INPUT MESSAGE SELECT DATABASE PROTECTION ALREADY ACTIVE**

**Explanation:** The ZRECP PROTECT command was entered specifying the SEL parameter but selective database protection is already active.

**System Action:** The command is rejected.

**User Response:** Determine why the ZRECP PROTECT command was entered specifying the SEL parameter twice.

See *TPF Operations* for more information about the ZRECP PROTECT command.

**BOFB0006I INCORRECT INPUT MESSAGE**

**Explanation:** The ZRECP PROTECT command was entered specifying an incorrect parameter.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZRECP PROTECT command.

**BOFB0007I SELECT DATABASE PROTECTION CONTINUING**

**Explanation:** This is the normal response to the ZRECP PROTECT command specifying the SEL parameter.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROTECT command.

**BOFB0008E SONRI/SONRPM ORDINAL NUMBER MISMATCH**

**Explanation:** The ZRECP PROTECT command was entered specifying the SEL parameter but online and pseudo directories do not have the same ordinal number.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP PROTECT command again.

See *TPF Operations* for more information about the ZRECP PROTECT command.

**BOFB0010I CANNOT ACCESS SELECT DATABASE PROTECTION RECOUP PHASE 1 CHAIN CHASE NOT COMPLETE**

**Explanation:** The ZRECP PROTECT command was entered specifying the SEL parameter but recoup phase 1 has not completed processing.

**System Action:** The command is rejected.

**User Response:**

1. Wait until recoup phase 1 completes.
2. Enter the ZRECP PROTECT command again.

See *TPF Operations* for more information about the ZRECP PROTECT command.

---

**BOFB0011E FACE ERROR ON SONRI ORDINAL** *ordnum*

**Where:**

*ordnum*
The ordinal number of the pool rollin directory (#SONRI) record.

**Explanation:** The ZRECP PROTECT command was entered specifying the SEL parameter but an error condition was detected by a FACE-type call while trying to retrieve the pool rollin directory (#SONRI) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP PROTECT command again.

See *TPF Operations* for more information about the ZRECP PROTECT command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**BOFB0012E FACE ERROR ON SONRPM ORDINAL** *ordnum*

**Where:**

*ordnum*
The ordinal number of the recoup merged directory (#SONRPM) record.

**Explanation:** The ZRECP PROTECT command was entered specifying the SEL parameter but an error condition was detected by a FACE-type call while trying to retrieve the #SONRPM record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP PROTECT command again.

See *TPF Operations* for more information about the ZRECP PROTECT command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**BOFB0013E FIND ERROR ON SONRI ORDINAL** *ordnum*

**Where:**

*ordnum*
The ordinal number of the pool rollin directory (#SONRI) record.

**Explanation:** The ZRECP PROTECT command was entered specifying the SEL parameter but an error condition was detected by the FIWHC macro while trying to retrieve the pool rollin directory (#SONRI) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP PROTECT command again.

See *TPF Operations* for more information about the ZRECP PROTECT command. See *TPF General Macros* for more information about the FIWHC macro.

---

**BOFB0014E FIND ERROR ON SONRPM ORDINAL** *ordnum*

**Where:**

*ordnum*
The ordinal number of the recoup merged directory (#SONRPM) record.

**Explanation:** The ZRECP PROTECT command was entered specifying the SEL parameter but an error condition was detected by the FINWC macro while trying to retrieve the #SONRPM record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP PROTECT command again.

See *TPF Operations* for more information about the ZRECP PROTECT command. See *TPF General Macros* for more information about the FINWC macro.

---

**BOFB0015E FILE ERROR ON SONRI ORDINAL** *ordnum*

**Where:**

*ordnum*
The ordinal number of the pool rollin directory (#SONRI) record.

**Explanation:** The ZRECP PROTECT command was entered specifying the SEL parameter but an error condition was detected by the FILNC macro while trying to file the online directory.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP PROTECT command again.

See *TPF Operations* for more information about the ZRECP PROTECT command. See *TPF General Macros* for more information about the FILNC macro.

---

**BOFB0016E MISMATCH ERROR ON SONRI ORDINAL** *ordnum*

**Where:**

*ordnum*
The ordinal number of the pool rollin directory (#SONRI) record.

**Explanation:** The ZRECP PROTECT command was entered specifying the SEL parameter but online and pseudo directories do not have the same ordinal number.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP PROTECT command again.

See *TPF Operations* for more information about the ZRECP PROTECT command.

**BOFB0017E MISMATCH ERROR ON SONRPM ORDINAL** *ordnum*

**Where:**

*ordnum*
The ordinal number of the recoup merged directory (#SONRPM) record.

**Explanation:** The ZRECP PROTECT command was entered specifying the SEL parameter but online and pseudo directories do not have the same ordinal number.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP PROTECT command again.

See *TPF Operations* for more information about the ZRECP PROTECT command.

**BOFD0002I FACE/FIND/FILE ERROR ON FC33 ORDINAL 00000064**

**Explanation:** The ZDUPD command was entered, but an error condition was detected by the FINWC macro, the FILNC macro, or a FACE-type call while trying to retrieve or file the released pool address (FC33) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZDUPD command again.

See *TPF Operations* for more information about the ZDUPD command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF General Macros* for more information about the FINWC and FILNC macros.

**BOFD0080E - CHECK GEN FILE AND INPUT MSG PREFIX - THEN RE-ENTER PROPER MESSAGE**

**Explanation:** The ZDUPD command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZDUPD command.

**BOFD0081E - GEN FILE NOT MOUNTED OR WRONG SUBSYSTEM**

**Explanation:** The ZDUPD command was entered, but the pool maintenance general file (DGF) is not mounted or the command was entered on the wrong subsystem.

**System Action:** The command is rejected.

**User Response:** If the pool maintenance general file (DGF) is not mounted, do the following:

1. Mount the pool maintenance general file (DGF).
2. Enter the ZDUPD command again.

If the command was entered from the wrong subsystem, enter the ZDUPD command again from the correct subsystem.

See *TPF Operations* for more information about the ZDUPD command.

**BOFD0089E - PDU CREATE IS ACTIVE, RETRY WHEN COMPLETE**

**Explanation:** The ZDUPD command was entered, but an online pool directory update (PDU) is active.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait for the PDU to complete.
2. Enter the ZDUPD command again.

See *TPF Operations* for more information about the ZDUPD command.

**BOFE0002E FACE/FIND/FILE ERROR ON FC33 ORDINAL** *ordnum*

**Where:**

*ordnum*
The ordinal number of the released pool address (FC33) record.

**Explanation:** The ZDUPD command was entered, but an error condition was detected by the FINWC macro, the FILNC macro, or a FACE-type call while trying to retrieve or file the FC33 record.

**System Action:** Continues processing.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZDUPD command again.

See *TPF Operations* for more information about the ZDUPD command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF General Macros* for more information about the FINWC and FILNC macros.

---

**BOFF0001E INCORRECT PSEUDO INDEX**

**Explanation:** The ZDUPD command was entered, but an error condition was detected by a FACE-type call while trying to retrieve a pool directory update (PDU) pseudo directory (#SONUP) or recoup pseudo directory (#SONRPE) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZDUPD command again.

See *TPF Operations* for more information about the ZDUPD command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**BOFF0003E FACE ERROR ON PSEUDO ORDINAL** *ordnum*

**Where:**

*ordnum*
An ordinal number used to retrieve a recoup pseudo directory (#SONRPE) or pool directory update (PDU) pseudo directory (#SONUP) record.

**Explanation:** The ZDUPD command was entered, but an error condition was detected by a FACE-type call while trying to retrieve the recoup pseudo directory (#SONRPE) or PDU pseudo directory (#SONUP) with the new ordinal number supplied.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZDUPD command again.

See *TPF Operations* for more information about the ZDUPD command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**BOFF0004E FIND ERROR ON PSEUDO RECORD ORDINAL** *ordnum* **SUD** *indicator*

**Where:**

*ordnum*
The ordinal number of a recoup pseudo directory (#SONRPE) or pool directory update (PDU) pseudo directory (#SONUP) record.

*indicator*
The data level error indicator (CE1SUD) of the entry control block (ECB).

**Explanation:** An error condition was detected by the WAITC macro because of a hardware error or unusual condition before all the input/output (I/O) could complete .

**System Action:** Recoup exits and control is given to the error routine specified with the WAITC macro.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF General Macros* for more information about the WAITC macro.

---

**BOFF0010I PSEUDO DIR FLUSH STARTED**

**Explanation:** This is a normal response to the ZRPDU CREATE command or during recoup processing, indicating that a set of recoup pseudo-directories will be flushed from virtual file access (VFA).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPDU CREATE command.

---

**BOFF0011I PSEUDO DIRECTORY FLUSH COMPLETE**

**Explanation:** This is a normal response to the ZRPDU CREATE command or during recoup processing, indicating that a set of recoup pseudo-directories has been flushed from virtual file access (VFA).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPDU CREATE command.

---

**BOFH0001I INCORRECT CALL TO PROGRAM BOFH FROM ONLINE RECOUP VFA DELAY FILE SUPPORT STATUS NOT CHANGED**

**Explanation:** During recoup processing, the BOFH segment was entered for a function other than to enable or disable virtual file access (VFA) delay file support.

**System Action:** The VFA delay file support status remains unchanged.

**User Response:** Determine why the BOFH program was entered incorrectly.

---

**BOFH0002I VFA DELAY FILE SUPPORT ENABLED FOR ONLINE RECOUP**

**Explanation:** This is a normal response during recoup processing, indicating that virtual file access (VFA) delay file support has been enabled.

**System Action:** None.

**User Response:** None.

**BOFH0003I SYSTEM IN NORM, DELAY FILE SUPPORT NOT DISABLED**

**Explanation:** During recoup processing, the BOFH segment was entered to disable virtual file access (VFA) delay file support but the TPF system is in NORM state.

**System Action:** The VFA delay file support status remains unchanged.

**User Response:** Determine why an attempt to disable VFA delay file support occurred while the TPF system is in NORM state.

**BOFH0004I VFA DELAY FILE SUPPORT DISABLED TOTAL OF *recnbr* RECORDS FILED FROM VFA**

**Where:**

*recnbr*
The total number of records filed when virtual file access (VFA) delay file support is disabled.

**Explanation:** This is a normal response during recoup processing, indicating that VFA delay file support has been disabled.

**System Action:** None.

**User Response:** None.

**BOFI0020E INVALID OPTION FOR ERRON**

**Explanation:** The ZRECP DISPLAY command was entered specifying the ERRON parameter incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**BOFI0021E INVALID OPTION FOR LOST**

**Explanation:** The ZRECP DISPLAY command was entered specifying the LOST parameter incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**BOFI0022E INVALID PROC ID GIVEN**

**Explanation:** The ZRECP DISPLAY command was entered specifying the PROC parameter incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**BOFI0023E INVALID SSU NAME SUPPLIED**

**Explanation:** The ZRECP DISPLAY command was entered specifying the SSU parameter incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**BOFI0024I UATBC CALL ERROR**

**Explanation:** The ZRECP DISPLAY command was entered, but an error condition was detected by a UATBC macro call.

**System Action:** The command fails.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**BOFI0025I FACE/FIND ERROR ON RECORD**

**Explanation:** The ZRECP DISPLAY command was entered, but an error condition was detected by a FACE-type call or a find macro.

**System Action:** The command fails.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

**BOFI0026I RECOUP PHASE 1 ID COUNTS DISPLAY**

**Explanation:** This is the normal response to the ZRECP DISPLAY command with the COUNTS parameter specified.

**System Action:** Recoup processing ends.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**BOFI0027I RECOUP ERRONEOUSLY AVAILABLE ID TABLE**

**Explanation:** This is the normal response to the ZRECP DISPLAY command with the ERRON parameter specified, displaying the recoup phase 3 erroneously available counts.

**System Action:** Recoup processing ends.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**BOFI0028I RECOUP LOST ADDRESS ID TABLE DISPLAY**

**Explanation:** This is the normal response to the ZRECP DISPLAY command with the LOST parameter specified, displaying the recoup phase 3 lost address pool counts.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**BOFI0029I RECOUP DEACTIVATED ID TABLE DISPLAY**

**Explanation:** This is the normal response to the ZRECP DISPLAY command with the DEAI parameter specified, displaying the ID counts for the deactivated file pool directory record (FPDR) sections.

**System Action:** Recoup processing ends.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**BOFJ0005E BRIDTO8 FACE/FIND ERROR**

**Explanation:** During recoup processing, an error condition was detected by the FINWC macro or a FACE-type call while trying to retrieve a record ID total count table (#BRIDTO8) record. #BRIDTO8 contains all of the ordinals of the record ID in-core count table (#BRIDTB8) for each processor and subsystem user (SSU).

**System Action:** Stops copying ID history.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup processing again.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF General Macros* for more information about the FINWC macro. See *TPF Database Reference* for more information about recoup functions and procedures.

**BOFJ0006E SSU CALCULATION ERROR - ID HISTORY COPY ABORTED**

**Explanation:** During recoup processing, the UATBC (MDBF User Attribute Reference Request) macro was not able to provide addressability to a subsystem user (SSU) slot in the subsystem user table, because of an EXCEEDED, INCORRECT, or NOT AVAILABLE condition.

**System Action:** Stops copying ID history.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup processing again.

See *TPF General Macros* for more information about the UATBC macro. See *TPF Database Reference* for more information about recoup functions and procedures.

**BOFJ0007E BRHIST8 FACE ERROR**

**Explanation:** During recoup processing, an error condition was detected by a FACE-type call while trying to retrieve a BRHIST8 record (history record).

**System Action:** Stops copying ID history.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup processing again.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF Database Reference* for more information about recoup functions and procedures.

**BOFK0001I NO OFFLINE MULTIPLE RELEASES PERFORMED**

**Explanation:** The ZRECP OFLMR or ZRPDU OFLMR command was entered, but there are no offline multiple releases to display.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP OFLMR and ZRPDU OFLMR commands.

**BOFK0004E INPUT MESSAGE TOO LONG**

**Explanation:** The ZRECP OFLMR or ZRPDU OFLMR command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZRECP OFLMR and ZRPDU OFLMR commands.

**BOFK0005E INCORRECT RELEASE LIMIT ENTERED**

**Explanation:** The ZRECP OFLMR or ZRPDU OFLMR command was entered specifying an incorrect display limit.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZRECP OFLMR and ZRPDU OFLMR commands.

**BOFK0006E FACS ERROR OCCURED - FACE TYPE IBMM4 ORD C414C**

**Explanation:** The ZRECP OFLMR or ZRPDU OFLMR command was entered, but an error condition was detected by a FACS-type call while trying to retrieve file address compute (FACE) program type #IBMM4 ordinal number C414C.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the command again.

See *TPF Operations* for more information about the ZRECP OFLMR and ZRPDU OFLMR commands. See *TPF System Macros* and *TPF Application Programming* for more information about the FACS program and the FACS interface.

**BOFK0007E FIND ERROR OCCURED – FARW = *farw***

**Where:**

*farw*
The file address reference word that is used to read the record.

**Explanation:** The ZRECP OFLMR or ZRPDU OFLMR command was entered, but an error condition was detected by a FACS-type call while trying to retrieve file address compute (FACE) program type #IBMM4 ordinal number C414C.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the command again.

See *TPF Operations* for more information about the ZRECP OFLMR and ZRPDU OFLMR commands. See *TPF System Macros* and *TPF Application Programming* for more information about the FACS program and the FACS interface.

**BOFK0008I RECOUP - OFFLINE MULTIPLE RELEASE ANALYSIS**

**Explanation:** This is the normal response to the ZRECP OFLMR or ZRPDU OFLMR command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP OFLMR and ZRPDU OFLMR commands.

**BOFM0001A TIME-OUT STILL PENDING, CONTINUE DISALLOWED**

**Explanation:** The ZRECP CONTINUE command was entered while there was an unresolved timeout error in the recoup online error log.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZRECP ONEL command to determine what timeout errors are still pending in the recoup online error log.
2. Investigate and correct the problem that caused the timeout error.
3. Enter ZRECP SEL to run a selective recoup on the timeout chain that was in error.
4. Enter the ZRECP CONTINUE command again, if necessary.

See *TPF Operations* for more information about the ZRECP CONTINUE, ZRECP ONEL, and ZRECP SEL commands.

**BOF00002I FACE/FIND/FILE ERROR ON EXCLUSION TABLE RECORD FACE TYPE - IBMML, ORDINAL NUMBER - EXCTBL**

**Where:**

*ordnum*
The ordinal number of the recoup FC33 exclusion table.

**Explanation:** During recoup processing, an error condition was detected while trying to retrieve (using the FACE, FIWHC, FILUC, or WAITC macro) the exclusion table record (index for exclusion processing for pool directory update (PDU) processing).

**System Action:** None.

**User Response:** Do the following:

1. Check the exclusion record that is indexed by the recoup FC33 exclusion table (#EXCTBL) and the use of the FACE, FIWHC, FILUC, or WAITC macro to determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF General Macros* for more information about the FIWHC, FILUC, and WAITC macros.

**BOF10001I RECOUP PHASE 1 ID COUNTS DISPLAY**

**Explanation:** This is a normal response to the ZRECP DISPLAY command with the COUNTS parameter specified or when no parameter is specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BOF10010I RECOUP DEACTIVATED ID TABLE DISPLAY**

**Explanation:** This is a normal response to the ZRECP DISPLAY command with the DEAI parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BOF10029I VALID FUNCTION IS DISPLAY**

**Explanation:** The ZRECP DISPLAY command was entered with an invalid parameter.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BOF20009E INCORRECT SECTION PARAMETER SPECIFIED**

**Explanation:** ZRECP DISPLAY POOLS SECTION-*pooldevtype* was entered, but the value specified for *pooldevtype* was incorrect.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct value for *pooldevtype*.
2. Enter ZRECP DISPLAY POOLS SECTION-*pooldevtype* again.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BOF20013I PDU - POOLS RETURNED SUMMARY DISPLAY**

**Explanation:** This is a normal response when ZRECP DISPLAY POOLS SECTION-SUM is entered after pool directory update (PDU) processing has completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BOF20014I RECOUP - POOLS IN USE SUMMARY DISPLAY**

**Explanation:** This is a normal response when ZRECP DISPLAY POOLS SECTION-SUM is entered after recoup phase 2 processing has completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BOF20015I PDU - POOLS RETURNED BY SECTION**

**Explanation:** This is a normal response after pool directory update (PDU) processing has completed or when ZRECP DISPLAY POOLS SECTION-ALL is entered.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BOF20016I RECOUP - POOLS IN USE BY SECTION**

**Explanation:** This is a normal response after recoup phase 2 processing has completed or when ZRECP DISPLAY POOLS SECTION-ALL is entered.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BOF20017I PDU - POOLS RETURNED FOR SECTION** *pooldevtype*

**Where:**

*pool*
The type of pool file.

*devtype*
The type of the device.

**Explanation:** This is a normal response when ZRECP DISPLAY POOLS SECTION-*pooldevtype* is entered after pool directory update (PDU) processing has completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BOF20018I RECOUP - POOLS IN USE BY SECTION POOLS** *pooldevtype*

**Where:**

*pool*
The type of pool file.

*devtype*
The type of the device.

**Explanation:** This is a normal response when ZRECP DISPLAY POOLS SECTION-*pooldevtype* is entered after recoup phase 2 processing has completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BOF30006E PSEUDO DIRECTORY INITIALIZATION HAS FAILED**

**Explanation:** The ZRPDU CREATE command was entered, but an error was detected during one of the following macro calls:

- EVINC
- EVNTC
- EVNWC
- POSTC

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRPDU CREATE command again.

See *TPF Operations* for more information about the ZRPDU CREATE command. See *TPF General Macros* for more information about the EVINC, EVNTC, EVNWC, and POSTC macros.

---

**BOF30007E FIND ERROR ON PSEUDO/SONRI ORDINAL** *ordnum*

**Where:**

*ordnum*
A hexadecimal ordinal number that is used to find a recoup pseudo directory (#SONRPE) or pool rollin directory (#SONRI) record.

**Explanation:** The ZRPDU CREATE command was entered, but an error condition was detected by the FINWC macro while trying to retrieve the recoup pseudo directory (#SONRPE) or pool rollin directory (#SONRI) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRPDU CREATE command again.

See *TPF Operations* for more information about the ZRPDU CREATE command. See *TPF General Macros* for more information about the FINWC macro.

---

**BOF30008E FACE ERROR ON PSEUDO/SONRI ORDINAL** *ordnum*

**Where:**

*ordnum*
A hexadecimal ordinal number that is used to find a recoup pseudo directory (#SONRPE), pool directory update (PDU) pseudo directory (#SONUP), or pool rollin directory (#SONRI) record.

**Explanation:** The ZRPDU CREATE command was entered, but an error condition was detected by a FACE-type call while trying to retrieve the recoup pseudo directory (#SONRPE), PDU pseudo directory (#SONUP), or pool rollin directory (#SONRI) record.

**System Action:** PDU processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRPDU CREATE command again.

See *TPF Operations* for more information about the ZRPDU CREATE command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**BOF30009E ERROR FILING PSEUDO ORDINAL** *ordnum*

**Where:**

*ordnum*
The hexadecimal ordinal number of a recoup pseudo directory (#SONRPE) or pool directory update (PDU) pseudo directory (#SONUP) record.

**Explanation:** The ZRPDU CREATE command was entered, but an error condition was detected by the FILNC or WAITC macro while trying to file the pseudo record.

**System Action:** PDU processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRPDU CREATE command again.

See *TPF Operations* for more information about the ZRPDU CREATE command. See *TPF General Macros* for more information about the FILNC and WAITC macros.

---

**BOF40004E PSEUDO DIRECTORY COUNT HAS FAILED**

**Explanation:** During recoup or pool directory update (PDU) processing, an event was defined that allows the entry control block (ECB) to wait until SWISC macro processing is completed for all ECBs. The event failed, which caused a count of the recoup pseudo directory (#SONRPE) or PDU pseudo directory (#SONUP) to fail. This can occur when one of the following macros is issued under the condition described:

- EVNTC (define internal event), if the specified name already exists in the event table
- EVINC (increment count for event), if the event does not exist
- EVNWC (wait for event completion), if the event has completed with error
- POSTC (mark event completion), if the event is not outstanding.

**System Action:** The function ends.

**User Response:** Do the following:

1. Correct the problem.
2. If the error occurred during recoup, recoup will abort.
3. If the error occurred during pool directory update (PDU), rerun PDU.

See *TPF Operations* for more information about the ZRECP RESTART command. See *TPF Database Reference* for more information about recoup and PDU functions and procedures.

---

**BOF40010I RECOUP INTEGRITY CHECKING STARTED**

**Explanation:** This is a normal message, during recoup or pool directory update (PDU) processing, indicating that integrity checking has started.

**System Action:** None.

**User Response:** None.

---

**BOF40011I RECOUP INTEGRITY CHECKING COMPLETED**

**Explanation:** This is a normal message, during recoup or pool directory update (PDU) processing, indicating that integrity checking has completed.

**System Action:** None.

**User Response:** None.

---

**BOF40015I PSEUDO DIR RECONCILE STARTED**

**Explanation:** This is a normal message, during recoup or pool directory update (PDU) processing, indicating that pseudo directory reconciliation has started.

**System Action:** None.

**User Response:** None.

---

**BOF40016I PSEUDO DIR RECONCILE COMPLETED**

**Explanation:** This is a normal message, during recoup or pool directory update (PDU) processing, indicating that pseudo directory reconciliation has completed.

**System Action:** None.

**User Response:** None.

---

**BOF40017E FACE ERROR ON PSEUDO ORDINAL** *ordnum*

**Where:**

*ordnum*
The hexadecimal ordinal number of a pool directory update (PDU) pseudo directory (#SONUP) record.

**Explanation:** During recoup or PDU processing, an error condition was detected by a FACE-type call while trying to retrieve the PDU pseudo directory (#SONUP).

**System Action:** Recoup or PDU processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup or PDU processing again.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF Database Reference* for more information about recoup and PDU functions and procedures.

---

**BOF40018E FIND ERROR ON PSEUDO ORDINAL** *ordnum*

**Where:**

*ordnum*
The hexadecimal ordinal number of a recoup pseudo directory (#SONRPE) or pool directory update (PDU) pseudo directory (#SONUP) record.

**Explanation:** During recoup or PDU processing, an error condition was detected by the FIWHC macro while trying to retrieve the recoup pseudo directory (#SONRPE) or PDU pseudo directory (#SONUP).

**System Action:** Recoup or PDU processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup or PDU processing again.

See *TPF General Macros* for more information about the FIWHC macro. See *TPF Database Reference* for more information about recoup and PDU functions and procedures.

---

**BOF40019E ERROR FILING PSEUDO ORDINAL** *ordnum*

**Where:**

*ordnum*
The hexadecimal ordinal number of a recoup pseudo directory (#SONRPE) or pool directory update (PDU) pseudo directory (#SONUP) record.

**Explanation:** During recoup or PDU processing, an error condition was detected by the FILNC or WAITC macro while trying to file the pseudo directory record.

**System Action:** Recoup or PDU processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup or PDU processing again.

See *TPF General Macros* for more information about the FILNC and WAITC macros. See *TPF Database Reference* for more information about recoup and PDU functions and procedures.

---

**BOF70004E CANNOT SWITCH BLOG ORDINALS**

**Explanation:** The ZRPDU CREATE command was entered, but processing could not switch the BLOG ordinals.

**System Action:** The command fails.

**User Response:** Enter the ZRPDU CREATE command again specifying the NOSWITCH parameter.

See *TPF Operations* for more information about the ZRPDU CREATE command.

---

**BOF70005E FIND/FILE ERROR ON STAT/LOG RECORD**

**Explanation:** The ZRPDU CREATE command was entered, but an error condition was detected while trying to find or file the RCPSTAT record or log record.

**System Action:** The entry control block (ECB) exits.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

See *TPF Operations* for more information about the ZRPDU CREATE command.

---

**BOF70008W PDU ABORT COMPLETE**

**Explanation:** This is the normal response to the ZRPDU ABORT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPDU ABORT command.

---

**BOF70010E INCORRECT MESSAGE FORMAT**

**Explanation:** One of the following occurred:

- A ZRREC command was entered incorrectly.
- A ZRPDU command was entered incorrectly.
- The input message block (level D0) does not contain a core block.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the appropriate command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about ZRREC and ZRPDU commands.

---

**BOF70012E FIND/FILE ERROR FC33 RECORD**

**Explanation:** The ZRPDU CREATE command was entered, but an error condition was detected while trying to retrieve or file the released pool address (FC33) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRPDU CREATE command again.

See *TPF Operations* for more information about the ZRPDU CREATE command.

---

**BOF70013W FIND/FILE ERROR ON CA RECORD, FA -** *faddr* **CE1SUD -** *indicator* **RECORD ID -** *recid* **PDU WILL CONTINUE**

**Where:**

*faddr*
The file address of the CA record.

*indicator*
The data level error indicator (CE1SUD).

*recid*
The record ID.

**Explanation:** The ZRPDU CREATE command was entered, but an error condition was detected while trying to find or file the CA record.

**System Action:** Processing continues with the next CA ordinal.

**User Response:** None.

See *TPF Operations* for more information about the ZRPDU CREATE command.

---

**BOF80001I FACE/FIND ERROR FC33 RECORD TO EXCLUDE** *ordnum*

**Where:**

*ordnum*
The ordinal number of the released pool address (FC33) record.

**Explanation:** The ZRPDU DISP command was entered, but an error condition was detected by the FINWC macro while trying to retrieve the FC33 record.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRPDU DISP command again.

See *TPF Operations* for more information about the ZRPDU DISP command. See *TPF General Macros* for more information about the FINWC macro.

---

**BOF80002I FACE/FIND ERROR EXCLUSION TABLE RECORD**

**Explanation:** The ZRPDU DISP command was entered, but an error condition was detected while trying to retrieve (using the FACE, FIWHC, FILUC, or WAITC macro) the recoup FC33 exclusion table record (index for exclusion processing for pool directory update (PDU) processing).

**System Action:** None.

**User Response:** Check the exclusion record that is indexed by the recoup FC33 exclusion table (#EXCTBL) and the use of the FACE, FIWHC, FILUC, or WAITC macro to determine the cause of the problem.

See *TPF Operations* for more information about the ZRPDU DISP command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF*

*General Macros* for more information about the FIWHC, FILUC, and WAITC macros.

**BOF80008I NO DATE START DURA CPU FILEADDR**

**Explanation:** This is a normal response to the ZRPDU DISP command showing the intervals that were excluded with the ZRPDU CREATE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPDU DISP and ZRPDU CREATE commands.

**BOF90001I PHASE 2 COMPLETED**

**Explanation:** This is the normal response when recoup phase 2 is completed.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

**BOF90002W COUNTS BY POOL TYPE NOT DISPLAYED IN 1052 STATE**

**Explanation:** The ZRECP DISPLAY command was entered, but ID counts cannot be displayed because the TPF system is in 1052 state.

**System Action:** The command is rejected.

**User Response:** If the TPF system can be cycled to NORM state, do the following:

1. Recycle TPF system to NORM state.
2. Enter the ZRECP DISPLAY command again.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

# BPKD–BRIE

**BPKD0052E Z*nnnn*, POSITIONAL PARAMETER FOUND WHEN EXPECTING KEYWORD.**

**Where:**

*nnnn*
The command prefix of the input in error.

**Segment Reference:** CBPK

**Explanation:** The TPF system issues this message if you specify a positional parameter when no more positionals are expected or after a keyword in a command.

**System Action:** The ECB is exited or the program takes the appropriate error branch.

**User Response:** None.

See *TPF General Macros* for more information about the BPKDC macro.

**BPKD0053E Z*nnnn, string* NOT A VALID PARAMETER**

**Where:**

*nnnn*
The command prefix of the input in error.

*string*
The character string that is not valid. This character string can be no more than 8 characters.

**Segment Reference:** CBPK

**Explanation:** The TPF system issues this message when you specify a positional character value in a command that is not defined for that position.

**System Action:** The entry control block (ECB) exits and the program takes the appropriate error branch.

**User Response:** None.

See *TPF General Macros* for more information about the BPKDC macro.

**BPKD0055E Z*nnnn*, KEYWORD *keywd* NOT DEFINED FOR THIS COMMAND**

**Where:**

*nnnn*
The command prefix of the input in error.

*keywd*
The keyword value that was specified

**Segment Reference:** CBPK

**Explanation:** The TPF system issues this message when you specify a keyword that cannot be found in the caller BPKD macro.

**System Action:** The entry control block (ECB) exits. or the program takes the appropriate error branch.

**User Response:** None.

See *TPF General Macros* for more information about the BPKDC macro.

**BPKD0056E Z*nnnn*, INVALID SYNTAX, NO CLOSING QUOTE**

**Where:**

*nnnn*
The command prefix of the input in error.

**Segment Reference:** CBPK

**Explanation:** The TPF system issues this message when you specify a quoted string in a command but the closing quote is missing.

**System Action:** The entry control block (ECB) exits. or the program takes the appropriate error branch.

**User Response:** None.

See *TPF General Macros* for more information about the BPKDC macro.

**BPKD0058E Z*nnnn*, INVALID SYNTAX, KEYWORD POINTING TO KEYWORD.**

**Where:**

*nnnn*
The command prefix of the input in error.

**Segment Reference:** CBPK

**Explanation:** CBPK issues this message when it finds a keyword pointing to another keyword.

**System Action:** The ECB is exited or the program takes the appropriate error branch.

**User Response:** None.

See *TPF General Macros* for more information about the BPKDC macro.

**BPKD0059E Z*nnnn*, *parm* PARAMETER IS REQUIRED.**

**Where:**

*nnnn*
The command prefix of the input in error.

*parm*
The name of the required parameter.

**Explanation:** The TPF system issues this message when you do not specify a required parameter in a command.

**System Action:** The entry control block (ECB) exits. or the program takes the appropriate error branch.

**User Response:** None.

See *TPF General Macros* for more information about the BPKDC macro.

**BPKD0060E Z*nnnn*, TOO MANY INPUT PARAMETERS ENTERED.**

**Where:**

*nnnn*
The command prefix of the input in error.

**Segment Reference:** CBPK

**Explanation:** The TPF system issues this message when you specify more parameters in the command than BPKD expects.

**System Action:** The entry control block (ECB) exits or the program takes the appropriate error branch.

**User Response:** None.

See *TPF General Macros* for more information about the BPKDC macro.

**BPKD0061E Z*nnnn*, TOO MANY CHARACTERS IN *parm* PARAMETER**

**Where:**

*nnnn*
The command prefix of the input in error.

*parm*
The name of parameter in error.

**Segment Reference:** CBPK

**Explanation:** The TPF system issues this message when you specify more characters in the command than allowed by the BPKD.

**System Action:** The entry control block (ECB) exits or the program takes the appropriate error branch.

**User Response:** None.

See *TPF General Macros* for more information about the BPKDC macro.

**BPKD0062E Z*nnnn*, INVALID HEX CHARACTER IN *parm* PARAMETER**

**Where:**

*nnnn*
The command prefix of the input in error.

*parm*
The name of parameter in error.

**Segment Reference:** CBPK

**Explanation:** The TPF system issues this message when you specify a hexadecimal character that is not valid in a field defined as hexadecimal.

**System Action:** The entry control block (ECB) exits or the program takes the appropriate error branch.

**User Response:** None.

See *TPF General Macros* for more information about the BPKDC macro.

**BPKD0063E Z*nnnn*, INVALID DECIMAL CHARACTER IN *parm* PARAMETER.**

**Where:**

*nnnn*
The command prefix of the input in error.

*parm*
The name of parameter in error.

**Segment Reference:** CBPK

**Explanation:** The TPF system issues this message when you specify a decimal character that is not valid in a field defined as decimal.

**System Action:** The entry control block (ECB) exits or the program takes the appropriate error branch.

**User Response:** None.

See *TPF General Macros* for more information about the BPKDC macro.

**BPKD0064E Z*nnnn*, ODD NUMBER OF HEX CHARACTERS IN *parm* PARAMETER.**

**Where:**

*nnnn*
The command prefix of the input in error.

*parm*
The name of parameter in error.

**Segment Reference:** CBPK

**Explanation:** The TPF system issues this message when you specify an odd number of characters for a hexadecimal character string. Unlike a hexadecimal number, which can be 1 through 8 characters, a hexadecimal character string can be 2 through 254 characters. However, there must be an even number of input characters.

**System Action:** The entry control block (ECB) exits or the program takes the appropriate error branch.

**User Response:** None.

See *TPF General Macros* for more information about the BPKDC macro.

---

**BPKD0065E Z*nnnn*, INVALID PERIOD FORMAT IN *parm* PARAMETER.**

**Where:**

*nnnn*
The command prefix of the input in error.

*parm*
The name of parameter in error.

**Segment Reference:** CBPK

**Explanation:** The TPF system issues this message when you specify more than one period in a parameter.

**System Action:** The entry control block (ECB) exits or the program takes the appropriate error branch.

**User Response:** None.

See *TPF General Macros* for more information about the BPKDC macro.

---

**BRB20001W INVALID INPUT FORMAT**

**Explanation:** The ZRECP ADD or ZRECP DEL command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZRECP ADD and ZRECP DEL commands.

---

**BRB20002W ANOTHER TABLE ALREADY SET UP**

**Explanation:** One of the following conditions exist:

- The ZRECP ADD or ZRECP DEL command specifying the IN parameter was entered, but the recoup run is already using the exclusion table.
- The ZRECP ADD or ZRECP DEL command specifying the EX parameter was entered, but the recoup run is already using the inclusion table.

**Note:** You can have an inclusion table or an exclusion table for a specific recoup run; not both.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP ADD or ZRECP DEL command again.

See *TPF Operations* for more information about the ZRECP ADD and ZRECP DEL commands.

---

**BRB20003W OVER 50 RECORD IDS ADDED. REQUEST IGNORED**

**Explanation:** The ZRECP ADD command was entered, but there are more than 50 record IDs in the inclusion or exclusion table.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ADD command.

---

**BRB20004W REBUILD IN PROGRESS**

**Explanation:** The ZRECP ADD command was entered, but a ZRECP REBUILD command is already processing. Records must be added to the exclusion or inclusion table before you enter the ZRECP REBUILD command.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ADD and ZRECP REBUILD commands.

---

**BRB20005W ROLLIN CREATE PHASE NOT ACTIVE**

**Explanation:** The ZRECP ADD command was entered, but recoup phase 3 is not active.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ADD command.

---

**BRB20006W ROLLIN PSEUDO DIRECTORIES NOT CREATED**

**Explanation:** The ZRECP ADD command was entered, but rollin directories have not yet been built.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ADD command.

---

**BRB20007W REBUILD ALREADY COMPLETE**

**Explanation:** The ZRECP ADD command was entered, but the ZRECP REBUILD command has already completed. Records must be added to the exclusion or inclusion table before you enter the ZRECP REBUILD command.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP

ADD and ZRECP REBUILD commands.

---

**BRB20008W RECOUP NOT ACTIVE**

**Explanation:** The ZRECP ADD or ZRECP DEL command was entered, but recoup is not active.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ADD and ZRECP DEL commands.

---

**BRB20009W EX/IN TABLE NOT INITIALIZED**

**Explanation:** The ZRECP DEL command was entered, but the exclusion or inclusion table is not initialized.

**System Action:** The command is rejected.

**User Response:** None.

---

**BRB20010I ID SET COMPLETE - ENTER ZRECP DISPLAY *parm* TO VERIFY**

**Where:**

*parm*
The parameter (EXC or INC) that is necessary to display the type of table that was created.

**Explanation:** This is the normal response to the ZRECP ADD or ZRECP DEL command.

**System Action:** None.

**User Response:** Enter the ZRECP DISPLAY command to confirm that the record ID was added to or deleted from the inclusion or exclusion table.

See *TPF Operations* for more information about the ZRECP ADD, ZRECP DEL, and ZRECP DISPLAY commands.

---

**BRB30001I *tabletype* ID TABLE**

**Where:**

*tabletype*
The type of table (inclusion or exclusion) that is displayed.

**Explanation:** This is the normal response to the ZRECP DISPLAY command specifying the INCLUDE or EXCLUDE parameter.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BRB30002I ID TABLE - NONE**

**Explanation:** The ZRECP DISPLAY command was entered, but there are no ID counts to display.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BRB30003W ROLLIN DIRECTORIES NOT BUILT**

**Explanation:** The ZRECP DISPLAY command was entered to display the list of record IDs in the recoup inclusion or recoup exclusion table but pseudo rollin directories have not been built.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP DISPLAY command again.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BRB30004W REBUILD IN PROGRESS**

**Explanation:** The ZRECP DISPLAY command was entered to display the list of record IDs in the recoup inclusion or recoup exclusion table but the ZRECP REBUILD command is processing.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait for the ZRECP REBUILD command to complete .
2. Enter the ZRECP DISPLAY command again.

See *TPF Operations* for more information about the ZRECP DISPLAY and ZRECP REBUILD commands.

---

**BRB30006W RECOUP NOT ACTIVE**

**Explanation:** The ZRECP DISPLAY command was entered, but recoup is not active.

**System Action:** The command is rejected.

**User Response:** Determine why the ZRECP DISPLAY command was entered while recoup was not active.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BRB40001E INCORRECT INPUT FORMAT**

**Explanation:** Enter one of the following commands:

- ZRECP REBUILD
- ZRECP REBUILD RESTART
- ZRECP REBUILD ABORT

**System Action:** The command is rejected.

**User Response:** Enter the correct command.

See *TPF Operations* for more information about the ZRECP REBUILD command.

---

**BRB40002E RECORD RETRIEVE ERROR, REBUILD ABORTED**

**Explanation:** The ZRECP REBUILD command was entered, but an error condition was detected by a FACE-type call while trying to retrieve the lost addresses (L80L8) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP REBUILD command again.

See *TPF Operations* for more information about the ZRECP REBUILD command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

**BRB40005E REBUILD ALREADY IN PROGRESS**

**Explanation:** The ZRECP REBUILD command was entered, but rebuild is already running.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP REBUILD command.

**BRB40006E ROLLIN PSEUDO DIRECTORIES NOT CREATED**

**Explanation:** The ZRECP REBUILD command was entered, but no rollin pseudo directories have been created.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP RESTART command again.
4. Enter the ZRECP REBUILD command again.

See *TPF Operations* for more information about the ZRECP RESTART and ZRECP REBUILD commands.

**BRB40007I RECP *exctot* TOTAL ADDRESSES EXCLUDED**

**Where:**

*exctot*
The number of pool addresses excluded from rebuild processing.

**Explanation:** This is the normal response to the ZRECP REBUILD command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP REBUILD command.

**BRCP0001E INVALID ID - INPUT MUST BE 2 OR 4 CHARACTERS**

**Explanation:** The ZRECP SEL command or the ZRECP RECALL command specifying the SEL parameter was entered with an incorrect length specified for the record ID value.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a correct record ID value.

See *TPF Operations* for more information the ZRECP SEL and ZRECP RECALL commands

**BRCP0002E INVALID SEL FILE ADDRESS**

**Explanation:** The ZRECP SEL command was entered specifying an incorrect file address.

**System Action:** The command is rejected.

**User Response:** Enter the ZRECP SEL command again and specify a correct file address.

See *TPF Operations* for more information about the ZRECP SEL command.

**BRCP0003E SPECIFIED SSU IS DORMANT**

**Explanation:** The ZRECP SEL command was entered after a system restart, specifying a subsystem user (SSU) prefix that is not available in the subsystem user table.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the system error that caused the SSU to become dormant.
2. Correct the system error.
3. ReIPL the TPF system.
4. Enter the ZRECP SEL command again.

See *TPF Operations* for more information about the ZRECP SEL command.

**BRCP0004E GLOBALS NOT LOADED. ZRECP COMMAND REJECTED**

**Explanation:** A ZRECP command was entered, but recoup globals have not been loaded.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Load the recoup globals.
2. Enter the ZRECP command again.

**BRCP0005E NCB REORGANIZATION IS ACTIVE - COMMAND REJECTED**

**Explanation:** A ZRECP command was entered, but the node control block (NCB) reorganization function is active.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait for the NCB reorganization function to complete or enter the ZNNCB REORG command to cancel the NCB reorganization function.
2. Enter the ZRECP command again.

See *TPF Operations* for more information ZRECP commands and the ZNNCB REORG command.

---

**BRCP0006T ILLEGAL ACTION**

**Explanation:** An incorrect command was entered.

**System Action:** None.

**User Response:** Enter the correct command.

---

**BRCP0007I ONEL FUNCTION COMPLETE**

**Explanation:** This is the normal response to the ZRECP ELOG command indicating that online error logging has been turned on or off.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ELOG command.

---

**BRCP0008E ENTRY RESTRICTED TO VM TEST SYSTEMS ONLY**

**Explanation:** The ZRECP FLUSH command was entered, but this command is valid only when running under VM (VPARS).

**System Action:** The command is rejected.

**User Response:** Determine why the command was entered incorrectly.

See *TPF Operations* for more information about the ZRECP FLUSH command.

---

**BRCP0009E RECOUP PHASE 2 STARTING/RUNNING -RETRY LATER**

**Explanation:** A ZRECP command other than ZRECP STATUS or ZRECP DISPLAY was entered while recoup phase 2 was running. All ZRECP commands other than ZRECP STATUS and ZRECP DISPLAY are restricted while recoup phase 2 is running.

**System Action:** The command is rejected.

**User Response:** Determine why the ZRECP command was entered incorrectly.

See *TPF Operations* for more information about ZRECP commands.

---

**BRCP0010E NOT VALID WITH SELECTIVE DB PROTECTION**

**Explanation:** The ZRECP RECALL command was entered, but selective database protection is processing. ZRECP RECALL is not valid while selective database protection is active.

**System Action:** The command is rejected.

**User Response:** Determine why the command was entered incorrectly.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

**BRCP0011E ID VERSION NBR NOT VALID OR GT 254**

**Explanation:** The ZRECP SEL or ZRECP RECALL command was entered, but the specified ID version number is incorrect or is larger than 254.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZRECP SEL and ZRECP RECALL commands.

---

**BRCP0012E REQUIRES SDPS AND TPFDF SUPPORT**

**Explanation:** A command that requires shared data processing system (SDPS) and TPFDF support was entered, but the TPF system does not have shared data processing system (SDPS) and TPFDF support installed.

**System Action:** The command is rejected.

**User Response:** None.

---

**BRCP0013W MOUNT RCP TAPE FOR OUTPUT**

**Explanation:** Recoup processing requires that the RCP tape be mounted for output on that subsystem.

**System Action:** Recoup processing waits for the RCP tape to be mounted.

**User Response:** Mount an RCP tape for output.

---

**BRCP0014A SELECTIVE DB PROTECT ACTIVE - EITHER PROTECT OR ABORT**

**Explanation:** The ZRECP RESUME command or a ZRECP command specifying the PROC parameter was entered, but is not allowed because selective database protection is active.

**System Action:** None.

**User Response:** Do one of the following:

- Enter the ZRECP PROTECT command specifying the SEL parameter to protect the selective database rollin.
- Enter the ZRECP IGNORE command to continue database rollin.
- Enter **ZRECP ABORT** to end the selective database rollin.

See *TPF Operations* for more information about the ZRECP PROTECT, ZRECP IGNORE, and ZRECP ABORT commands.

---

**BRCP0015E SELECTIVE DB PROTECTION NOT ACTIVE**

**Explanation:** The ZRECP PROTECT command was entered specifying the SEL parameter but selective database protection is not active.

**System Action:** The command is rejected.

**User Response:** Determine why the ZRECP PROTECT command was entered specifying the SEL parameter when the ZRECP RECALL command specifying the SEL parameter had not previously been entered to start selective database chain chasing.

See *TPF Operations* for more information about the ZRECP PROTECT and ZRECP RECALL commands. See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BRCP0016I RECOUP PHASE 2 STARTING OR IN PROGRESS**

**Explanation:** This is the normal response to the ZRECP STATUS or ZRECP DISPLAY command while recoup phase 2 is running.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS and ZRECP DISPLAY commands.

---

**BRCP0017E GLOBALS NOT LOADED. ZRECP COMMAND REJECTED**

**Explanation:** A ZRECP command was entered, but recoup globals have not been loaded.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP command again.

---

**BRCP0018E REQUIRES TPFDF SUPPORT**

**Explanation:** A command that requires TPFDF support was entered, but the TPF system does not have TPFDF support installed.

**System Action:** The command is rejected.

**User Response:** None.

---

**BRCP0019E DSNAME NOT VALID**

**Explanation:** The ZRECP RECALL command was entered specifying the SEL and DS parameters, but the specified dataset name was not correct.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

**BRCP0320I RECOUP IS NOT ACTIVE**

**Explanation:** This is the normal response to the ZRECP STATUS command or an internal status request indicating that recoup is not running.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command.

---

**BRCP0321I RECOUP RESTART REQUIRED**

**Explanation:** This is the normal response to the ZRECP STATUS command or an internal status request indicating that a recoup restart is required to continue recoup processing.

**System Action:** None.

**User Response:** Enter the ZRECP RESTART command.

See *TPF Operations* for more information about the ZRECP STATUS and ZRECP RESTART commands.

---

**BRCP0322I RECOUP PHASE 2 COMPLETE**

**Explanation:** This is the normal response to the ZRECP STATUS command or an internal status request indicating that recoup phase 2 processing has been completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command.

---

**BRCP0323I RECOUP WAITING FOR PHASE 1 RECALL**

**Explanation:** This is the normal response to the ZRECP STATUS command or an internal status request indicating that recoup is waiting to begin phase 1 chain chase processing.

**System Action:** None.

**User Response:** Enter the ZRECP RECALL command.

See *TPF Operations* for more information about the ZRECP STATUS and ZRECP RECALL commands.

---

**BRCP0324I RECOUP SEL RESTART REQUIRED**

**Explanation:** This is the normal response to the ZRECP STATUS command or an internal status request indicating that a recoup restart is required to continue selective recoup processing.

**System Action:** None.

**User Response:** Enter the ZRECP RESTART command.

See *TPF Operations* for more information about the ZRECP STATUS and ZRECP RESTART commands.

---

**BRCP0325I RECOUP SEL WAITING FOR PHASE 1 RECALL**

**Explanation:** This is the normal response to the ZRECP STATUS command or an internal status request indicating that recoup is waiting to begin phase 1 selective chain chase processing.

**System Action:** None.

**User Response:** Enter the ZRECP RECALL command specifying the SEL parameter.

See *TPF Operations* for more information about the ZRECP STATUS and ZRECP RECALL commands.

**BRCP0327I RECOUP ACTIVE - CHECK RECOUP PRIME PROCESSOR**

**Explanation:** The ZRECP STATUS command was entered on a processor that is not performing chain chase processing.

**System Action:** None.

**User Response:** Enter the ZRECP STATUS command on a processor that is performing chain chase processing.

See *TPF Operations* for more information about the ZRECP STATUS commands.

**BRCR0001I FC33 LOGGING RECORDS SWITCHED**

**Explanation:** This is a normal response to the ZRECP RECALL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RECALL command.

**BRCR0002I UNABLE TO SWITCH BLOG ORDINALS**

**Explanation:** During recoup processing, an error condition was detected by a FACE-type call while trying to read the released pool address (FC33) record.

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF Database Reference* for more information about recoup functions and procedures.

**BREP0001A SELECTIVE DB PROTECT ACTIVE - EITHER PROTECT OR ABORT**

**Explanation:** The ZRECP RESUME command or a ZRECP command specifying the PROC parameter was entered, but is not allowed because selective database protection is active.

**System Action:** None.

**User Response:** Do one of the following:

- Enter the ZRECP PROTECT command specifying the SEL parameter to protect the selective database rollin.
- Enter the ZRECP IGNORE command to continue database rollin.
- Enter **ZRECP ABORT** to end the selective database rollin.

See *TPF Operations* for more information about the ZRECP PROTECT, ZRECP IGNORE, and ZRECP ABORT commands.

**BREP0002T ILLEGAL ACTION**

**Explanation:** An incorrect command was entered.

**System Action:** None.

**User Response:** Enter the correct command.

**BREP0003I ONEL FUNCTION COMPLETE**

**Explanation:** This is the normal response to the ZRECP ELOG command indicating that online error logging has been turned on or off.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ELOG command.

**BREP0004E ENTRY RESTRICTED TO VM TEST SYSTEMS ONLY**

**Explanation:** The ZRECP FLUSH command was entered, but this command is valid only when running under VM (VPARS).

**System Action:** The command is rejected.

**User Response:** Determine why the command was entered incorrectly.

See *TPF Operations* for more information about the ZRECP FLUSH command.

**BREP0005E RECOUP PHASE 2 STARTING/RUNNING -RETRY LATER**

**Explanation:** A ZRECP command other than ZRECP STATUS or ZRECP DISPLAY was entered while recoup phase 2 was running. All ZRECP commands other than ZRECP STATUS and ZRECP DISPLAY are restricted while recoup phase 2 is running.

**System Action:** The command is rejected.

**User Response:** Determine why the ZRECP command was entered incorrectly.

See *TPF Operations* for more information about ZRECP commands.

**BREP0006E REQUIRES TPFDF SUPPORT**

**Explanation:** A command that requires TPFDF support was entered, but the TPF system does not have TPFDF support installed.

**System Action:** The command is rejected.

**User Response:** None.

---

**BRID0003I BEGIN ID TABLE MERGE**

**Explanation:** This is a normal response during recoup processing indicating the beginning of the ID table merge.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BRID0004I END ID TABLE MERGE**

**Explanation:** This is a normal response during recoup processing indicating the completion of the ID table merge, from a merge request input.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BRID0005E PROBLEM WITH STEPPING THROUGH SS USERS**

**Explanation:** The ZRECP CONTINUE command was entered, but the UATBC (MDBF User Attribute Reference Request) macro has found one of the following conditions while providing addressability to a subsystem user (SSU) slot in the subsystem user table:

- Exceeded
- Incorrect
- Not available

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP CONTINUE command again.

See *TPF Operations* for more information about the ZRECP CONTINUE command. See *TPF General Macros* for more information about the UATBC macro.

---

**BRID0006E FACS/FILNC ERROR ON ID TABLE**

**Explanation:** The ZRECP CONTINUE command was entered, but one of the following conditions exist:

- Level 1 (the ID table) does not contain a core block.
- An error condition was detected by the FINWC macro, the FIWHC macro, or a FACE-type call while trying to retrieve the ID table.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP CONTINUE command again.

See *TPF Operations* for more information about the ZRECP CONTINUE command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF General Macros* for more information about the FINWC and FIWHC macros.

---

**BRID0008E RECOUP PAUSED BECAUSE OF ERROR IN DATABASE SRM41A. POSTPROCESS DUMP**

**Explanation:** The ZRECP CONTINUE command was entered, but the BRID segment entered the BGAQ segment to add an LREC (logical record) to the TPFDF recoup statistics database (SRM41A) and BGAQ returned with an error condition.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP CONTINUE command again.

See *TPF Operations* for more information about the ZRECP CONTINUE command.

---

**BRID0009E FIND ERROR ON ID TABLE RESTART COPY**

**Explanation:** The ZRECP CONTINUE command was entered, but an error condition was detected by the FINWC macro while trying to retrieve the ID table restart copy.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP CONTINUE command again.

See *TPF Operations* for more information about the ZRECP CONTINUE command. See *TPF General Macros* for more information about the FINWC macro.

---

**BRIE0002I ID TABLE INITIALIZED FOR CPU** *cpuid*

**Where:**

*cpuid*
The name of the processor.

**Explanation:** This is the normal response to the ZRECP RECALL command when the ID table is initialized for a processor.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

### BRIE0005E PROBLEM WITH STEPPING THROUGH SS USERS

**Explanation:** The ZRECP RECALL command was entered, but the UATBC (MDBF User Attribute Reference Request) macro has found one of the following conditions while providing addressability to a subsystem user (SSU) slot in the subsystem user table:

- The number of the SSU slot provided exceeds the number of SSU slots.
- The number of the SSU slot provided is an incorrect SSU slot number.
- All of the SSU slots are being used.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP RECALL command again.

See *TPF Operations* for more information about the ZRECP RECALL command. See *TPF General Macros* for more information about the UATBC macro.

### BRIE0006E FACS/FILNC ERROR ON ID TABLE

**Explanation:** The ZRECP RECALL command was entered, but an error condition was detected by a FACE-type call while trying to find or the FILNC or WAITC macro while trying to file the ID table.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP RECALL command again.

See *TPF Operations* for more information about the ZRECP RECALL command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF General Macros* for more information about the FILNC and WAITC macros.

### BRIE0007E ERROR INITIALIZING STATISTICAL ID COUNTS DATABASE SRM41A

**Explanation:** The ZRECP RECALL command was entered, but the BRIE segment entered the BGAQ segment to initialize the TPFDF recoup statistics database (SRM41A) and BGAQ returns with an error condition.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP RECALL command again.

See *TPF Operations* for more information about the ZRECP RECALL command.

## BROW

### BROW0051E MALLOC FOR BUFFER ALLOCATION FAILED

**Explanation:** A ZBROW command could not be completed because storage could not be allocated. This is most likely the result of an internal logic error.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative for more information.

See *TPF Operations* for more information about the ZBROW commands.

### BROW0098E TPFCS ERROR, ERROR CODE *errcode errtext*

**Where:**

*errcode*
The error code.

*errtext*
The text describing the error.

**Explanation:** A ZBROW command could not be completed because an error occurred. This error may or may not be internal. The error code from the associated environment block is displayed.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check for other errors that preceded this message to help determine why TPF collection support (TPFCS) was unable to process the information for the specified request.
2. See your IBM service representative if you determine the error is internal.

See *TPF Operations* for more information about the ZBROW commands and see the *TPF C/C++ Language Support User's Guide* for the TPFCS error code summary.

### BROW0099E TO2 INTERNAL ERROR, ERROR CODE *errcode errtext*

**Where:**

*errcode*
The internal error code.

*errtext*
The text describing the error.

**Explanation:** A ZBROW command could not be completed because an internal error occurred. The error code from the associated environment block is displayed.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative for more information if you are unable to determine the cause of the internal error.

See *TPF Operations* for more information about the ZBROW commands and see the *TPF C/C++ Language Support User's Guide* for the TPF collection support (TPFCS) error code summary.

**BROW0201I LOCATION – *location* NAME – *classname***

**Where:**

*location*
The base address of the class.

*classname*
The name of the class specified on the command.

**Explanation:** This is the normal response to the ZBROW CLASS command with the DISPLAY and NAME parameters specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW CLASS command.

**BROW0202I CLASS LOCATION DISPLAY**

**Explanation:** This is the normal response to the ZBROW CLASS command with the DISPLAY and ALL parameters specified.

**System Action:** Information about defined classes and their locations follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW CLASS command and for an example of the informational display.

**BROW0203I METHOD LOCATION DISPLAY**

**Explanation:** This is the normal response to the ZBROW CLASS command with the LOCATE or METHODS parameter specified.

**System Action:** Information about methods and locations of the specified class follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW CLASS command and for an example of the informational display.

**BROW0204I CLASS INHERITANCE DISPLAY**

**Explanation:** This is the normal response to the ZBROW CLASS command with the TREE parameter specified.

**System Action:** Information about the hierarchy of classes follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW CLASS command and for an example of the informational display.

**BROW0205I CLASS INFORMATION DISPLAY**

**Explanation:** This is the normal response to the ZBROW CLASS command with the INFORMATION parameter specified.

**System Action:** Information about the specified class follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW CLASS command and for an example of the informational display.

**BROW0206I CLASS ATTRIBUTES DISPLAY**

**Explanation:** This is the normal response to the ZBROW CLASS command with the ATTRIBUTES parameter specified.

**System Action:** Information about the values for the class attributes of the specified class follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW CLASS command and for an example of the informational display.

**BROW0210I BROWSE OF CLASS COMPLETED**

**Explanation:** This is the normal response to the ZBROW CLASS command. This message is displayed whether the ZBROW CLASS command was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, enter the ZBROW CLASS command again.

See *TPF Operations* for more information about the ZBROW CLASS command.

**BROW0251E ERROR PRINTING TEXT, REQUEST ENDED**

**Explanation:** A ZBROW CLASS command could not be completed because of a printer error.

**System Action:** The command is rejected.

**User Response:** Review other messages to determine the cause of the printer failure.

See *TPF Operations* for more information about the ZBROW CLASS command.

**BROW0252E SPECIFIED PRINTER NOT AVAILABLE**

**Explanation:** The ZBROW CLASS command was entered with the MAP parameter specified to assign a printer. An error occurred because the specified printer is not available.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Make sure that unit record support is configured on the TPF system and that a printer has been defined.
2. Enter the ZBROW CLASS command again specifying the MAP parameter.

See *TPF Operations* for more information about the ZBROW CLASS command.

**BROW0253E ERROR ALLOCATING BUFFER FOR CURSOR**

**Explanation:** A ZBROW CLASS command could not be completed because an error occurred while trying to allocate memory. This is most likely the result of an internal logic error.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative for more information.

See *TPF Operations* for more information about the ZBROW CLASS command.

**BROW0254E CLASS INFORMATION UNAVAILABLE**

**Explanation:** The ZBROW CLASS command was entered with the ATTRIBUTES parameter specified to display the class attributes. There are no class attributes to display for the specified class.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW CLASS command.

**BROW0255E EITHER CLASS OR ALL MUST BE SPECIFIED**

**Explanation:** A ZBROW CLASS command with the DOCUMENT parameter specified was entered without the name of the class or the ALL parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW CLASS command again specifying a class name or the ALL parameter.

See *TPF Operations* for more information about the ZBROW CLASS command.

**BROW0256E EITHER METHOD OR ALL MUST BE SPECIFIED, BUT NOT BOTH**

**Explanation:** A ZBROW CLASS command with the DOCUMENT parameter specified was entered with both the METHOD and ALL parameters specified. These parameters cannot be specified at the same time.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW CLASS command with the DOCUMENT parameter again specifying either the METHOD or ALL parameter.

See *TPF Operations* for more information about the ZBROW CLASS command.

**BROW0257E NAME AND ALL CANNOT BOTH BE SPECIFIED**

**Explanation:** A ZBROW CLASS command with the DISPLAY parameter specified was entered with both the name of the class and ALL parameters specified. These parameters cannot be specified at the same time.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW CLASS command with the DISPLAY parameter again specifying either the name of the class or the ALL parameter.

See *TPF Operations* for more information about the ZBROW CLASS command.

**BROW0258E CLASS NAME *classname* UNDEFINED**

**Where:**

*classname*
The name of the class specified on the command.

**Explanation:** TPF collection support could not find the class name specified on a ZBROW CLASS command.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. If the class name was specified correctly, see your system programmer to determine why TPF collection support was unable to find the class name.
2. If the class name was not specified correctly, enter the ZBROW CLASS command again specifying a valid class name.

See *TPF Operations* for more information about the ZBROW CLASS command.

**BROW0259E METHOD NAME *methodname* UNDEFINED FOR CLASS NAME *classname***

**Where:**

*methodname*
The name of the method whose documentation was to be printed.

*classname*
The name of the class specified on the command.

**Explanation:** The ZBROW CLASS command was entered with the METHOD parameter specified to find the method name of the specified class. An error occurred because TPF collection support was unable to find the method name specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter **ZBROW CLASS TREE** to review the class hierarchy because the method you are looking for might be inherited from a superclass.
2. Enter **ZBROW CLASS METHOD NAME-***classname* to get a list of defined methods for the class and verify that the method name is in the list.
3. Do one of the following:
   a. If the method is in the list, see your system programmer to determine why TPF collection support was not able to find it. Once a determination has been made, enter the ZBROW CLASS command again specifying a valid method name.
   b. If the method is not in the list, see your IBM service representative for more information. Once the problem has been solved, enter the ZBROW CLASS command again specifying a valid method name.

See *TPF Operations* for more information about the ZBROW CLASS command.

**BROW0301I NAME DEFINITION DISPLAY**

**Explanation:** This is the normal response to the ZBROW NAME command with the DISPLAY parameter specified.

**System Action:** Information about the collection name, data store name, and collection persistent identifier (PID) follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW NAME command.

**BROW0303I COLLECTION NAME SUCCESSFULLY DEFINED**

**Explanation:** This is the normal response to the ZBROW NAME command with the DEFINE parameter specified and the ZBROW COLLECTION command with the COPY, COPYDD, or MIGRATE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW NAME or ZBROW COLLECTION command.

**BROW0304I COLLECTION NAME SUCCESSFULLY REMOVED**

**Explanation:** This is the normal response to the ZBROW NAME command with the REMOVE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW NAME command.

**BROW0310I NAME DEFINITION REQUEST COMPLETED**

**Explanation:** This is the normal response to the ZBROW NAME command. This message is displayed whether ZBROW NAME was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, enter the ZBROW NAME command again.

See *TPF Operations* for more information about the ZBROW NAME command.

**BROW0351E NAME – *colname* IS UNDEFINED**

**Where:**

*colname*
The collection name to display.

**Explanation:** A ZBROW NAME command was entered with the DISPLAY parameter specified and a collection name that is not defined.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZBROW NAME command again specifying the DISPLAY parameter and a valid collection name.
- Define the collection name by entering the ZBROW NAME command again with the DEFINE parameter specified.

See *TPF Operations* for more information about the ZBROW NAME command.

**BROW0352E EITHER NAME OR ALL MUST BE SPECIFIED**

**Explanation:** A ZBROW NAME command with the DISPLAY parameter specified or a ZBROW PROPERTY command with the DELETE or DISPLAY parameter specified was entered without the name of the class or the ALL parameter.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

1. Enter the ZBROW NAME command again specifying the DISPLAY parameter with a valid class or specifying the ALL parameter.
2. Enter the ZBROW PROPERTY command again specifying the DISPLAY or DELETE parameter with a valid class or specifying the ALL parameter.

See *TPF Operations* for more information about the ZBROW NAME or ZBROW PROPERTY command.

**BROW0353E ERROR WRITING COLL NAME, NAME NOT DEFINED**

**Explanation:** An internal error occurred while processing a ZBROW NAME command.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative for more information.

See *TPF Operations* for more information about the ZBROW NAME command.

**BROW0354E ERROR REMOVING COLLECTION NAME, NAME NOT REMOVED**

**Explanation:** A ZBROW NAME command was entered with the REMOVE parameter specified to remove a collection name. An error occurred because the collection name was either not found or was incorrect.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct collection name.
2. Enter the ZBROW NAME command again specifying the REMOVE parameter and a valid collection name.

See *TPF Operations* for more information about the ZBROW NAME command.

**BROW0355E DATA STORE *dsname* INCORRECT OR NOT DEFINED**

**Where:**

*dsname*
The data store name.

**Explanation:** A ZBROW NAME command was entered with an incorrect or undefined data store name previously established with a ZBROW QUALIFY command.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check to see if the specified data store name is correct by entering **ZOODB DISPLAY DS ALL**. Then, do the following:
   a. Correct qualification on a misspelled data store name by entering the ZBROW QUALIFY command again with the SET parameter specified and specify the data store name.
   b. Determine why the ZBROW NAME command failed if the data store is in the list of defined data stores, and report the failure to your system programmer.
2. Enter the ZBROW NAME command again.

See *TPF Operations* for more information about the ZBROW QUALIFY or ZBROW NAME command.

**BROW0356E TO2 NOT INITIALIZED**

**Explanation:** A ZBROW command could not be processed because the TPFCS database is not initialized.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB INIT command if your database was never initialized or see your system programmer.

See *TPF Operations* for more information about the ZBROW or ZOODB INIT command.

**BROW0357E SPECIFIED NAME NOT FOUND**

**Explanation:** An error occurred while trying to process a ZBROW NAME command because the specified name was not found.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW NAME command again.

See *TPF Operations* for more information about the ZBROW NAME command.

**BROW0358E BROWSER DICTIONARY IS EMPTY**

**Explanation:** The ZBROW NAME command was entered with the DISPLAY and ALL parameters specified to display collection names. The names could not be displayed because there are no collection names defined for the qualified data store.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW NAME command.

**BROW0359E NAME – *colname* IS ALREADY DEFINED**

**Where:**

*colname*
The target name of the collection.

**Explanation:** A ZBROW NAME command with the DEFINE parameter specified could not be processed because the target name is already assigned to a collection.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW NAME command again using a target collection name that is not already in use.

See *TPF Operations* for more information about the ZBROW NAME command.

**BROW0360E COLLECTION NAME NOT DEFINED**

**Explanation:** A ZBROW NAME command with the REMOVE parameter specified was entered with a collection name that is not defined.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW NAME command again with the name of a defined collection specified.

See *TPF Operations* for more information about the ZBROW NAME command.

**BROW0399E INVALID NAME DEFINITION REQUEST CODE**

**Explanation:** An internal error occurred while processing a ZBROW NAME command.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative for more information.

**BROW0402I VALIDATION REPORT DISPLAY**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the VALIDATE parameter specified. This header is followed by the persistent identifier (PID) of the collection being validated and a formatted display of the errors that occurred during the validation of this collection. Each of the possible errors follows with a unique error identifier as shown in the display. The lower the identifier, the higher the severity of the problem.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD0000 - VALIDATE FOUND NO STRUCTURAL ERRORS ON *chain* CHAIN

**Where:**

*chain*
The structure chain validated (CONTROL, ALLOCATED DATA or RELEASED DATA, ALLOCATED KEY or RELEASED KEY, or ALLOCATED DIRECTORY or RELEASED DIRECTORY).

## BROW0402I

**Explanation:** Validation processing did not find any errors for the specified chain in the internal structure of the collection. TPF collection support reconstruction may not be necessary.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD0150 - VALIDATION REQUEST DENIED. NOT SUPPORTED FOR COLLECTIONS WITH RESIDENCY TYPE COMPACT.

**Explanation:** The ZBROW COLLECTION command was entered with the VALIDATE parameter specified to attempt to validate a collection with residency-type COMPACT. Validation is only supported for collections with residency type EXTENDED. The residency type of a collection can be displayed by using the ZBROW COLLECTION command with the DISPLAY parameter specified.

**System Action:** The original collection is left unchanged from its original state before you entered the ZBROW COLLECTION command with the VALIDATE parameter specified.

**User Response:** Enter the ZBROW COLLECTION command with the DISPLAY parameter specified to verify that the collection in question is of residency-type COMPACT. If the residency type is COMPACT, repair the collection by doing one of the following:

- If the collection has been captured, restore it rather than reconstructing it.
- Enter the ZBROW COLLECTION command with the ATTRIBUTES parameter specified to display the internal attributes of the collection. Then, use the ZDFIL command to study the layout of the collection on the TPF database as well as the contents of its internal records where both control information and data are stored. Only after carefully studying the layout of the collection as well as the logical structure of each of its physical records, should you attempt to repair the collection by entering the ZAFIL command to change the contents of its internal records.

See *TPF Operations* for more information about the ZBROW COLLECTION, ZDFIL, and ZAFIL commands.

**Action Identifier:** VALD1000 - HARDWARE/SOFTWARE ERROR ON *chain* CHAIN AT FA *fileAddr*.

**Where:**

*chain*
The corrupted chain of the record (CONTROL, ALLOCATED DATA or RELEASED DATA, ALLOCATED KEY or RELEASED KEY, or ALLOCATED DIRECTORY or RELEASED DIRECTORY).

*fileAddr*
The file address that has the error.

**Explanation:** The file address of a record on the specified chain is not a valid file address reference format (FARF) file address or the storage medium for the record is damaged.

**Note:** If a file address of zero is indicated, it is likely that the chain anchor and count are zero when there should be records on that chain.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD1200 - RECORD ID/RCC CHECK ON *chain* CHAIN AT FA *fileAddr*.

**Where:**

*chain*
The corrupted chain of the record (CONTROL, DATA, KEY, or DIRECTORY).

*fileAddr*
The file address that has the error.

**Explanation:** A record on the specified chain has been identified as having an incorrect record ID or record code check (RCC), or both.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD1300 - RECORD ON *chain* CHAIN AT FA *fileAddr*. RECORD HAS NO SHADOW.

**Where:**

*chain*
The corrupted chain of the record (CONTROL, DATA, KEY, or DIRECTORY).

*fileAddr*
The file address that has the error.

**Explanation:** A record on the specified chain for a collection that is being shadowed has no embedded shadow file address.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD1301 - RECORD ON *chain* CHAIN AT FA *fileAddr*. IO ERROR ON SHADOW *fileAddr1*.

**Where:**

*chain*
The corrupted chain of the record (CONTROL, DATA, KEY, or DIRECTORY).

*fileAddr*
The file address of the prime record.

*fileAddr1*
The file address of the shadow record.

**Explanation:** An input/output (I/O) error was received while attempting to read the embedded file address of the shadow record.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD1302 - RECORD ON *chain* CHAIN AT FA *fileAddr*. SHADOW *fileAddr1* PRIME/SHADOW MISMATCH.

**Where:**

*chain*
The corrupted chain of the record (CONTROL, DATA, KEY, or DIRECTORY).

*fileAddr*
The file address of the prime record.

*fileAddr1*
The file address of the shadow record.

**Explanation:** A compare of the prime record and the shadow record failed. These records should be the same.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD1303 - RECORD ON *chain* CHAIN AT FA *fileAddr*. SHADOW NOT ACTIVE, SHADOW ASSIGNED FA *fileAddr1*

**Where:**

*chain*
The corrupted chain of the record (DATA, KEY, or DIRECTORY).

*fileAddr*
The file address of the prime record.

*fileAddr1*
The file address of the shadow record.

**Explanation:** A collection that does not have shadowing active has an embedded shadow file address.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD1304 - RECORD ON *chain* CHAIN AT FA *fileAddr*. HEADER DOES NOT MATCH ASSIGNED FA.

**Where:**

*chain*
The corrupted chain of the record (CONTROL, DATA, KEY, or DIRECTORY).

*fileAddr*
The file address of the prime record.

**Explanation:** The embedded prime file address of the record does not match the actual file address of the record.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD1305 - RECORD ON *chain* CHAIN AT FA *fileAddr*. RECORD CONTROL FLAG IS NOT VALID.

**Where:**

*chain*
The corrupted chain of the record (CONTROL, DATA, KEY, or DIRECTORY).

*fileAddr*
The file address of the prime record.

**Explanation:** The format control flag of the record is not correct.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD1500 - CLASS ID MISMATCH ON *chain* CHAIN AT FA *fileAddr*.

**Where:**

*chain*
The corrupted chain of the record (ALLOCATED or RELEASED DATA or KEY).

*fileAddr*
The file address that has the error.

**Explanation:** A record on the specified chain has been identified as having an incorrect class identifier (ID).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD1800 - OWNER ID MISMATCH ON *chain* CHAIN AT FA *fileAddr*.

**Where:**

*chain*
The corrupted chain of the record (DATA, KEY, or DIRECTORY).

*fileAddr*
The file address of the record whose owner ID is incorrect.

**Explanation:** A record on the specified chain has been identified as having an incorrect owner ID value.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD2000 - INCORRECT FORMAT FOR RRN ON *chain* CHAIN AT FA *fileAddr*.

**Where:**

*chain*
The corrupted chain of the record (DATA or KEY).

*fileAddr*
The file address that has the error.

**Explanation:** A record on the specified chain has been identified as having an RRN that is negative, which is a format that is not valid.

**System Action:** None.

## BROW0402I

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD4000 - DIRECTORY NOT AVAILABLE FOR RRN *rrn* ON *chain* CHAIN.

**Where:**

*rrn* The RRN that does not have a directory entry associated with it.

*chain*
The corrupted chain of the record (DATA or KEY).

**Explanation:** An attempt to locate the directory entry for a specific RRN of a block on the specified chain failed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD4200 - FILE ADDRESS MISMATCH FOR RRN *rrn* ON *chain* CHAIN.

**Where:**

*rrn* The RRN whose data record and directory entry file addresses do not match.

*chain*
The corrupted chain of the record (DATA or KEY).

**Explanation:** A directory entry whose RRN is the same as the record on the chain specified has a different file address than that of the record.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD4201 - SHADOW FILE MISMATCH FOR RRN *rrn* ON *chain* CHAIN.

**Where:**

*chain*
The corrupted chain of the record (DATA, KEY, or DIRECTORY).

*fileAddr*
The file address of the prime record.

**Explanation:** The directory entry for the record has a different shadow file address than the embedded shadow address of the record.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD4500 - SEVERE DIRECTORY ERROR FOR RRN *rrn* ON *chain* CHAIN.

**Where:**

*rrn* The relative record number (RRN) that does not have a directory entry associated with it.

*chain*
The corrupted chain of the record (DATA or KEY).

**Explanation:** An attempt to locate the directory entry for the RRN of a block in the specified chain failed, causing a serious error.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD5100 - INCORRECT RID/RCC DETECTED IN STRUCTURE CONTROL FOR *chain* RECORDS.

**Where:**

*chain*
The structure control chain type (DATA, KEY, or DIRECTORY) found to have an RID/RCC value of zero.

**Explanation:** Validate processing for the structure control record detected a zero RID/RCC value for the specified chain.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD5200 - INCORRECT CHAIN TYPE INDICATOR IN STRUCTURE CONTROL FOR *chain* CHAIN.

**Where:**

*chain*
The structure control chain type (DATA, KEY, or DIRECTORY) found to have an incorrect chain type identifier tag.

**Explanation:** Validate processing for the structure control record detected an incorrect chain type identifier tag for the specified chain.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD5900 - INCORRECT CHAIN CONTROL VALUES IN STRUCTURE CONTROL FOR *chain* CHAIN.

**Where:**

*chain*
The structure control chain type (DATA, KEY, or DIRECTORY) found to have an incorrect control information.

**Explanation:** Validate processing for the structure control record detected an incorrect chain relative record number (RRN) count or an inconsistency between the RRN count and the associated file chain pointer.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD9000 - *chain* CHAIN LENGTH MISMATCH. STRUCTURE COUNT: *structCount* ACTUAL COUNT: *actualCount*.

**Where:**

*chain*
The corrupted chain type (ALLOCATED DATA or RELEASED DATA, KEY, or DIRECTORY) found to have a closed loop chain.

*structCount*
The structure count of blocks on the specified chain.

*actualCount*
The actual number of blocks on the specified chain.

**Explanation:** The count of the number of blocks on the specified chain does not match the actual number of blocks on the chain.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** VALD9500 - CLOSED LOOP CHAIN DETECTED DURING CHAIN CHASE FOR *chain* CHAIN.

**Where:**

*chain*
The corrupted chain type (ALLOCATED DATA or RELEASED DATA, KEY, or DIRECTORY) assumed to have a closed loop chain.

**Explanation:** Validate processing for the specified chain detected a mismatch between the number of relative record numbers (RRNs) indicated and the actual number of records on the chain. The chain chase exceeded 2 cycles of 1000 additional chained record reads. Validate processing ended the chain chase, assuming a closed loop chain.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW commands.

---

**BROW0403I COLLECTION PARTS DISPLAY**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the PARTS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command and for an example of the informational display.

---

**BROW0404I RECONSTRUCTION REPORT DISPLAY**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the RECONSTRUCT parameter specified. This header is followed by the persistent identifier (PID) of the collection being reconstructed and a formatted display of the errors corrected and actions taken during reconstruction of the object, including a list of errors that have not been resolved. Each of the possible actions follows with a unique action identifier, as shown in the display.

**Action Identifier:** RECN0000 - RECONSTRUCTION FOUND NO ERRORS TO CORRECT.

**Explanation:** Reconstruction processing did not find any errors to process because the validation report is empty or all errors have been corrected already.

**System Action:** None.

**User Response:** Enter the ZBROW COLLECTION command again with the VALIDATE parameter specified to verify that there are no errors in the collection.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** RECN0100 - MULTIPLE CONFLICTING HIGH SEVERITY ERRORS. AMBIGUITY UNRESOLVABLE.

**Explanation:** One of the following errors occurred:

- A request to reconstruct a data chain of a collection by using the ZBROW COLLECTION command with the RECONSTRUCT parameter specified has failed because the internal mapping of the collection (for example, the key and directory chains, or both, as well as other control fields and counts) needed to rebuild the data chain were not accessible or contain errors.
- The ZBROW COLLECTION command was entered with the RECONSTRUCT parameter specified to reconstruct the data chain of a collection. An error occurred because the internal mapping of the collection (for example, the key or directory chains as well as other control fields and counts) needed to rebuild the data chain were not accessible or contained errors.
- The ZBROW COLLECTION command was entered with the RECONSTRUCT parameter specified to reconstruct a key of collection or directory chains. An error occurred because the data chain and possibly other control fields, all of which are needed to rebuild the chain or chains in question, were not accessible or contain errors.
- The ZBROW COLLECTION command was entered with the RECONSTRUCT parameter specified to reconstruct a collection. An error occurred because TPF system failures such as irrecoverable input/output (I/O) errors or file pool depletion occurred.

**System Action:** The original collection remains unchanged from its original state before entering the ZBROW COLLECTION command with the RECONSTRUCT parameter specifying either KEYS or DIRECT.

**User Response:** Do the following:

1. Enter a ZBROW COLLECTION command with the VALIDATE parameter specified to determine if there are any errors in the collection beyond an error in the chain you are trying to reconstruct.
2. Do one of the following:
   - If there are no errors beyond an error in the chain you are trying to reconstruct, investigate what TPF system failures may have occurred and resolve these.
   - If you were trying to just reconstruct the directory chain but the validation report from the ZBROW COLLECTION command with the VALIDATE parameter specified indicates that both the directory and key chains are corrupted, try to reconstruct both of these chains. To reconstruct both chains, enter another ZBROW

COLLECTION command with the RECONSTRUCT parameter specifying KEYS as a parameter rather than DIRECT.

- Use the validation report to manually inspect and repair the internal structures of the collection until either a subsequent ZBROW COLLECTION command with the VALIDATE parameter specified indicates that that there are no more errors, or another ZBROW COLLECTION command with the RECONSTRUCT parameter specified to perform the original request is now successful.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** RECN0150 - RECONSTRUCT REQUEST DENIED. NOT SUPPORTED FOR COLLECTIONS WITH RESIDENCY TYPE COMPACT

**Explanation:** The ZBROW COLLECTION command was entered with the RECONSTRUCT parameter specified to attempt to reconstruct a collection with residency-type COMPACT. Reconstruct is only supported for collections with residency type EXTENDED. The residency type of a collection can be displayed by using the ZBROW COLLECTION command with the DISPLAY parameter specified.

**System Action:** The original collection is left unchanged from its original state before you entered the ZBROW COLLECTION command with the RECONSTRUCT parameter specified.

**User Response:** Enter the ZBROW COLLECTION command with the DISPLAY parameter specified to verify that the collection in question is of residency-type COMPACT. If the residency type is COMPACT, repair the collection by doing one of the following:

- If the collection has been captured, restore it rather than reconstructing it.
- Enter the ZBROW COLLECTION command with the ATTRIBUTES parameter specified to display the internal attributes of the collection. Then, enter the ZDFIL command to study the layout of the collection on the TPF database as well as the contents of its internal records where both control information as well as data are stored. Only after carefully studying the layout of the collection as well as the logical structure of each of its physical records, should you attempt to repair the collection by entering the ZAFIL command to change the contents of its internal records.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** RECN0155 - RECONSTRUCT KEYS REQUEST DENIED. NOT SUPPORTED FOR NON-KEYED COLLECTIONS

**Explanation:** The ZBROW COLLECTION command was entered with both the KEYS parameter and the RECONSTRUCT parameter specified to reconstruct a key chain of a collection. An error occurred because the collection is not keyed.

**System Action:** The original collection is left unchanged from its original state before you entered the ZBROW COLLECTION command with the RECONSTRUCT parameter specified.

**User Response:** Enter the ZBROW COLLECTION command again specifying the RECONSTRUCT parameter and a parameter other than the KEYS parameter. For example, if you want to repair the internal mapping of the collection and the directory chain, enter the ZBROW COLLECTION command with the RECONSTRUCT and DIRECTORY parameters specified.

Next, do one of the following:

- If the collection has been captured, restore it by entering the ZBROW COLLECTION command with the RESTORE parameter specified rather than attempting to reconstruct it.
- Enter the ZBROW COLLECTION command with the ATTRIBUTES parameter specified to display the internal attributes of the collection. Then, enter the ZDFIL commands to study the layout of the collection on the TPF database as well as the contents of its internal records where both control information as well as data are stored. Only after carefully studying the layout of the collection as well as the logical structure of each of its physical records, should you attempt to repair the collection by entering the ZAFIL command to change the contents of its internal records.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**Action Identifier:** RECN1100 - *chain* CHAIN RECONSTRUCTED. CHAIN LENGTH IS *length*.

**Where:**

*chain*
The corrupted chain (DATA, KEY, or DIRECTORY).

*length*
The number of blocks that are on the reconstructed chain.

**Note:** Entries on the directory chain are overflow for the imbedded directories of the control records. Therefore, a length of zero indicates there is no overflow.

**Explanation:** Action identifiers VALD1000, VALD1200, VALD1500, or VALD1800 has been corrected.

**System Action:** The specified chain was reconstructed.

**User Response:** None.

---

**BROW0405I COLLECTION DISPLAY**

**Explanation:** This is the normal response to the ZBROW DISPLAY command with the COLLECTION parameter specified.

**System Action:** Information about the collection follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW DISPLAY command and for an example of the informational display.

---

**BROW0406I COLLECTION ATTRIBUTES DISPLAY**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the ATTRIBUTES parameter specified.

**System Action:** Information about the values of all attributes

for the collection specified follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command and for an example of the informational display.

---

**BROW0407I COLLECTION NAME DISPLAY**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the NAME parameter specified. This header is followed by a formatted display of characteristics about the collection specified or about components of the collection.

**System Action:** Information about the collection follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command and for an example of the informational display.

---

**BROW0408I COLLECTION ELEMENT DISPLAY**

**Explanation:** This is the normal response to the ZBROW DISPLAY command with the ELEMENT` parameter specified.

**System Action:** Information about the specified element of the collection follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW DISPLAY command and for an example of the informational display.

---

**BROW0410I BROWSE OF COLLECTION COMPLETE**

**Explanation:** This is the normal response to the ZBROW COLLECTION or ZBROW DISPLAY command. This message is displayed whether the ZBROW COLLECTION or ZBROW DISPLAY command was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, correct it and enter the ZBROW COLLECTION or ZBROW DISPLAY command again.

See *TPF Operations* for more information about the ZBROW COLLECTION or ZBROW DISPLAY command.

---

**BROW0411I COPY COMPLETED**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the COPY parameter specified. This message is displayed whether the ZBROW COLLECTION command was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, correct it and enter the ZBROW COLLECTION command again.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0412I DELETE COMPLETED**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the DELETE parameter specified. This message is displayed whether the ZBROW COLLECTION command was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, correct it and enter the ZBROW COLLECTION command again.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0413I RECLAIM COMPLETED**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the RECLAIM parameter specified. This message is displayed whether ZBROW COLLECTION was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, correct it and enter the ZBROW COLLECTION command again.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0414I COLLECTION HAS BEEN EMPTIED**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the EMPTY parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0415I COLLECTION MARKED FOR DELETION**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the DELETE parameter specified.

**System Action:** The collection will be deleted after a 48-hour delay.

**User Response:** Do one of the following:

- If you want to unmark the collection for deletion, enter the ZBROW COLLECTION command with the RECLAIM parameter specified.
- If you do not want to unmark the collection for deletion, do nothing and the collection will be deleted after a 48-hour delay.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0416I COLLECTION SUCCESSFULLY RECLAIMED**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the RECLAIM parameter specified. This command was entered for a collection that was marked for deletion.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**BROW0417I COLLECTION COPIED SUCCESSFULLY**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the COPY parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**BROW0418I ADDALL COMPLETED**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the ADDALL parameter specified. This message is displayed whether ZBROW COLLECTION was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, correct it and enter the ZBROW COLLECTION command again.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**BROW0419I CAPTURE COMPLETED**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the CAPTURE parameter specified. This message is displayed whether ZBROW COLLECTION was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, correct it and enter the ZBROW COLLECTION command again.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**BROW0420I RESTORE COMPLETED**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the RESTORE parameter specified. This message is displayed whether ZBROW COLLECTION was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, correct it and enter the ZBROW COLLECTION command again.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**BROW0421I COLLECTION *colname* SUCCESSFULLY CAPTURED**

**Where:**

*colname*
The name of the captured collection.

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the CAPTURE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**BROW0422I COLLECTION *origname* SUCCESSFULLY RESTORED AS *newname***

**Where:**

*origname*
The name of the captured collection.

*newname*
The name of the restored collection.

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the RESTORE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**BROW0423I COLLECTION MIGRATED SUCCESSFULLY**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the MIGRATE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

**BROW0424I MIGRATION PROCESSING COMPLETED**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the MIGRATE parameter specified. This message is displayed whether the ZBROW COLLECTION command was successful or not.

**System Action:** If an error occurs, this message is accompanied by another, more specific online error message.

**User Response:** If an error occurs, do the following:

1. Examine the accompanying online message to determine the cause of the error.
2. Correct the error.

3. Enter the ZBROW COLLECTION command again specifying the MIGRATE parameter.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0425I ACCESS MODE FOR COLLECTION CHANGED**

**Explanation:** This is the normal response to the ZBROW ALTER command with the MODE parameter specified. This message is displayed when ZBROW ALTER is successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, correct it and enter the ZBROW ALTER command again.

See *TPF Operations* for more information about the ZBROW ALTER command.

---

**BROW0426I EMPTY PROCESSING COMPLETED**

**Explanation:** This is the normal response to the ZBROW COLLECTION command with the EMPTY parameter specified. This message is displayed whether the ZBROW COLLECTION command was successful or not.

**System Action:** If an error occurs, this message is accompanied by another, more specific online error message.

**User Response:** If an error occurs, do the following:

1. Examine the accompanying online message to determine the cause of the error.
2. Correct the error.
3. Enter the ZBROW COLLECTION command again specifying the EMPTY parameter.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0451E DSNAME REQUIRED WITH DISPLAY ALL REQUEST**

**Explanation:** A ZBROW DISPLAY command was entered with the COLLECTION and ALL parameters specified but without specifying a data store (DS) name.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW DISPLAY command again specifying the name of the data store.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

---

**BROW0452E COLLECTION NAME NOT DEFINED**

**Explanation:** A ZBROW command was entered with a collection name specified that is not defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Define a name for the collection by entering the ZBROW NAME command with the DEFINE parameter specified.
2. Enter the ZBROW command again with the name of the defined collection specified.

See *TPF Operations* for more information about the ZBROW commands.

---

**BROW0453E COLLECTION NAME OR ALL PARAMETER REQUIRED**

**Explanation:** A ZBROW DISPLAY command with the COLLECTION parameter specified was entered without specifying either the name of the collection or the ALL parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW DISPLAY command again specifying a collection name or the ALL parameter.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

---

**BROW0454E COLLECT NAME NOT ALLOWED WITH DISPLAY ALL**

**Explanation:** A ZBROW DISPLAY command was entered with a collection name and the COLLECTION and ALL parameters specified. You cannot specify both a collection name and the ALL parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW DISPLAY command again specifying a collection name or the ALL parameter.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

---

**BROW0455E DSNAME IS NOT ALLOWED WITH COLLECTION NAME**

**Explanation:** A ZBROW DISPLAY command was entered with the COLLECTION parameter, a collection name, and the DS parameter specified. You cannot specify a collection name with the DS parameter.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZBROW DISPLAY command again specifying the collection name.
- Enter the ZBROW DISPLAY command again specifying the ALL and DS parameters.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

---

**BROW0456E HEX CONVERSION ERROR ON VALUE PARAMETER**

**Explanation:** A ZBROW DISPLAY command was entered with the ENTRY and VALUE parameters specified. This command was not processed because the hexadecimal value specified for the VALUE parameter contained one of the following:

- An odd number of hexadecimal digits
- Digits that are not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW DISPLAY command again specifying a valid hexadecimal value.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

---

**BROW0457E SPECIFIED INDEX BEYOND END OF COLLECTION**

**Explanation:** A ZBROW DISPLAY command was entered with the ENTRY parameter specified. This command was not processed because the collection index specified is greater than the maximum index for the collection.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW DISPLAY command again specifying a valid collection index.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

---

**BROW0458E COLLECTION INFORMATION UNAVAILABLE**

**Explanation:** A ZBROW COLLECTION command was entered, but there is no information available for display. This may result from an internal logic error.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative for more information.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0459E SPECIFIED COLLECTION IS EMPTY**

**Explanation:** This is the response to the ZBROW command when there are no elements in the collection name specified. There are no elements to process.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW commands.

---

**BROW0461E ZERO INDEX NOT ALLOWED**

**Explanation:** The ZBROW DISPLAY command was entered with the ENTRY parameter specified with a zero index. A zero index is not allowed because indexed collections are 1-based. Enter 1 for the first element.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW DISPLAY command again specifying the ENTRY parameter and a valid index.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

---

**BROW0462E CHAIN TYPE NOT SPECIFIED**

**Explanation:** The ZBROW COLLECTION command was entered with the RECONSTRUCT parameter specified. An error occurred because a chain type was not specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW COLLECTION command again specifying a valid chain-type parameter (DATA, KEYS, or DIRECTORY).

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0463E COLLECTION NOT MARKED FOR DELETION**

**Explanation:** A ZBROW COLLECTION command was entered with the RECLAIM parameter specified for a collection that was not originally marked for deletion.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0464E ERROR RETURN *xx* BY TPFxd_archiveStart**

**Where:**

*xx* The error code value.

**Explanation:** A ZBROW COLLECTION command with the CAPTURE parameter specified could not be processed because an error occurred on a `TPFxd_archiveStart` function call.

**System Action:** The command is rejected.

**User Response:** See the *TPF C/C++ Language Support User's Guide* for more information about error codes.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0465E ERROR RETURN *xx* BY TPFxd_archiveEnd**

**Where:**

*xx* The error code value.

**Explanation:** A ZBROW COLLECTION command with the CAPTURE parameter specified could not be processed because an error occurred on a `TPFxd_archiveEnd` function call.

**System Action:** The command is rejected.

**User Response:** See the *TPF C/C++ Language Support User's Guide* for more information about error codes.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0466E ERROR ON NAMEDEF REPLACE**

**Explanation:** A ZBROW COLLECTION command with the CAPTURE parameter specified could not be processed because an error occurred while accessing the browser dictionary.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine why the request failed by using any previous output to the console and displays using the ZBROW COLLECTION command with the DISPLAY parameter specified.
2. Enter the ZBROW COLLECTION command again specifying the CAPTURE parameter.
3. If you are unable to resolve the error, see your IBM service representative for more information.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0467E NAME - *colname* NOT PREVIOUSLY CAPTURED**

**Where:**

*colname*
The name of the collection.

**Explanation:** The collection name specified on a ZBROW COLLECTION command with the RESTORE parameter specified does not have an entry in the browser dictionary that shows it was previously captured by the ZBROW COLLECTION command with the CAPTURE parameter specified. Because the collection was not previously captured, it could not be restored.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

1. If the collection was previously captured, determine why the browser dictionary does not show the entry. After correcting the problem, enter the ZBROW COLLECTION command again specifying the RESTORE parameter.
2. If the collection was not previously captured, capture it by entering the ZBROW COLLECTION command with the CAPTURE parameter specified. After the collection has been captured, enter the ZBROW COLLECTION command again specifying the RESTORE parameter.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0468E ERROR ATTEMPTING TO DEFINE NEW NAME *colname***

**Where:**

*colname*
The target name of the restored collection.

**Explanation:** A ZBROW COLLECTION command with the RESTORE parameter specified could not be processed because an error occurred while accessing the browser dictionary.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine why the request failed by using any previous output to the console and displays using the ZBROW COLLECTION command with the DISPLAY parameter specified.
2. Enter the ZBROW COLLECTION command again specifying the RESTORE parameter.
3. If you are unable to resolve the error, see your IBM service representative for more information.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0469E COLLECTION *colname* NOT CAPTURED BECAUSE OF ERROR**

**Where:**

*colname*
The name of the collection.

**Explanation:** An error occurred while processing a ZBROW COLLECTION command with the CAPTURE parameter specified. The collection displayed in the message was not captured.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine why the request failed by using any previous output to the console and displays using the ZBROW COLLECTION command with the DISPLAY parameter specified.
2. Enter the ZBROW COLLECTION command again specifying the CAPTURE parameter.
3. If you are unable to resolve the error, see your IBM service representative for more information.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0470E COLLECTION *orignname* NOT RESTORED BECAUSE OF ERROR**

**Where:**

*orignname*
The name of the captured collection.

**Explanation:** An error occurred while processing a ZBROW COLLECTION command with the RESTORE parameter specified. The collection displayed in the message was not restored.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine why the request failed by using any previous output to the console and displays using the ZBROW COLLECTION command with the DISPLAY parameter specified.
2. Enter the ZBROW COLLECTION command again specifying the RESTORE parameter.
3. If you are unable to resolve the error, see your IBM service representative for more information.

See *TPF Operations* for more information about the ZBROW COLLECTION command.

---

**BROW0473E DELETE NOT ALLOWED FOR COLLECTION**

**Explanation:** This is the response to the ZBROW COLLECTION command with the DELETE parameter specified when the access mode of the specified collection does not allow the collection to be deleted.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZBROW DISPLAY command with the COLLECTION parameter specified to determine the current access mode of the collection.
2. If the current mode is either NODELETE or READONLY, change the access mode to a mode that will allow you to delete the collection. To change the access mode, enter the ZBROW ALTER command specifying the MODE parameter.
3. Enter the ZBROW COLLECTION command again specifying the DELETE parameter.

See *TPF Operations* for more information about the ZBROW COLLECTION, ZBROW DISPLAY, and ZBROW ALTER commands.

**BROW0474E UNDEFINED ACCESS MODE SPECIFIED**

**Explanation:** A ZBROW ALTER command was entered with the MODE parameter specified and an undefined access mode.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Select a valid mode.
2. Enter the ZBROW ALTER command again specifying a valid MODE parameter.

See *TPF Operations* for more information about the ZBROW ALTER command.

**BROW0475E ATTEMPTED DISPLAY BEYOND END OF COLLECTION**

**Explanation:** A ZBROW DISPLAY command with the ENTRY parameter specified was entered for a binary large object (BLOB), but the relative start address (RSA) value specified was beyond the end of the collection.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW DISPLAY command again specifying a valid RSA value.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

**BROW0480E NO INVENTORY EXISTS IN DATA STORE**

**Explanation:** A ZBROW DISPLAY command was entered with the COLLECTION, ALL, and DS parameters specified, but the data store (DS) name specified has no inventory.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW DISPLAY command again specifying the COLLECTION, ALL, and DS parameters and be sure the data store name has a valid inventory.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

**BROW0501I PROPERTY DISPLAY**

**Explanation:** This is the normal response to the ZBROW PROPERTY command with the DISPLAY parameter specified.

**System Action:** The message is followed by:

- A list of all property names defined for the specified collection
- Information about the property specified for the collection name.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW PROPERTY command and for an example of the informational display.

**BROW0502I PROPERTY DEFINITION REQUEST SUCCESSFUL**

**Explanation:** This is the normal response to the ZBROW PROPERTY command with the DEFINE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW PROPERTY command.

**BROW0503I PROPERTY DELETION REQUEST SUCCESSFUL**

**Explanation:** This is the normal response to the ZBROW PROPERTY command with the DELETE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW PROPERTY command.

**BROW0510I PROPERTY REQUEST COMPLETED**

**Explanation:** This is the normal response to the ZBROW PROPERTY command with the DEFINE parameter specified. This message is displayed whether the ZBROW PROPERTY command was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, correct it and enter the ZBROW PROPERTY command again.

See *TPF Operations* for more information about the ZBROW PROPERTY command.

**BROW0551E EBCDIC TO HEXADECIMAL CONVERSION ERROR**

**Explanation:** A ZBROW PROPERTY command did not end successfully because of an error converting from EBCDIC to hexadecimal for a STRUCT property type.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW PROPERTY command again specifying a valid hexadecimal property value.

See *TPF Operations* for more information about the ZBROW PROPERTY command.

---

**BROW0552E PROPERTY TYPE SPECIFIED NOT VALID**

**Explanation:** A ZBROW PROPERTY command was entered with the DEFINE parameter specified and a property type specified that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW PROPERTY command again specifying the DEFINE parameter and a property type that is valid.

See *TPF Operations* for more information about the ZBROW PROPERTY command.

---

**BROW0553E PROPERTY MODE SPECIFIED NOT VALID**

**Explanation:** A ZBROW PROPERTY command was entered with the DEFINE parameter specified and a property mode specified that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW PROPERTY command again specifying the DEFINE parameter and a property mode that is valid.

See *TPF Operations* for more information about the ZBROW PROPERTY command.

---

**BROW0554E PROPERTY NAME NOT FOUND FOR PID**

**Explanation:** A ZBROW PROPERTY command could not be processed because no properties are defined for the collection specified.

**System Action:** The command is rejected.

**User Response:** Enter the command again specifying a different collection name with properties defined.

See *TPF Operations* for more information about the ZBROW PROPERTY command.

---

**BROW0555E NO PROPERTIES DEFINED FOR PID**

**Explanation:** A ZBROW PROPERTY command could not be processed because no properties are defined for the collection specified. This is the normal response when no properties are defined.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW PROPERTY command.

---

**BROW0556E COLLECTION NAME UNDEFINED OR PID NOT VALID**

**Explanation:** A ZBROW command was entered with an undefined or incorrect name or persistent identifier (PID).

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZBROW command again specifying a defined collection name or valid PID.
- Define the collection name by entering the ZBROW NAME command with the DEFINE parameter specified.

See *TPF Operations* for more information about the ZBROW commands.

---

**BROW0557E PROPERTY MODE OR TYPE PROHIBITS VALUE CHANGE**

**Explanation:** A ZBROW PROPERTY command with the DEFINE parameter specified could not be processed because of one of the following:

- The property is READONLY or NOCHANGE.
- The property type specified is different than the existing property type.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW PROPERTY command again specifying a valid property type. If the property mode is READONLY or NOCHANGE, no value change can occur.

See *TPF Operations* for more information about the ZBROW PROPERTY command.

---

**BROW0558E PROPERTY MODE PROHIBITS DELETION OF PROPERTY**

**Explanation:** A ZBROW PROPERTY command with the DELETE parameter specified could not be processed because the existing property mode is READONLY or NODELETE.

**System Action:** The command is rejected.

**User Response:** None. The property mode can only be deleted when the entire collection is deleted.

See *TPF Operations* for more information about the ZBROW PROPERTY command.

---

**BROW0559E EITHER NAME OR ALL MUST BE SPECIFIED, BUT NOT BOTH**

**Explanation:** A ZBROW PROPERTY command with the DISPLAY parameter specified was entered with either both the NAME and ALL parameters specified or neither parameter specified. These parameters cannot be specified at the same time.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW PROPERTY command again specifying either the name of the class or the ALL parameter.

See *TPF Operations* for more information about the ZBROW PROPERTY command.

---

**BROW0599E INTERNAL ERROR, PROP REQUEST NOT VALID**

**Explanation:** Internal errors occurred during the processing of a ZBROW PROPERTY command.

**System Action:** None.

**User Response:** See your IBM service representative for more information.

See *TPF Operations* for more information about the ZBROW PROPERTY command.

---

**BROW0602I BROWSER QUALIFIED FOR DSNAME** *dsname*

**Where:**

*dsname*
The data store name.

**Explanation:** This is the normal response for ZBROW commands.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW commands.

---

**BROW0606I BROWSER QUALIFICATION DISPLAY**

**Explanation:** This is the normal response to the ZBROW QUALIFY command with the DISPLAY and ALL parameters specified. This message is followed by a display of the current qualification settings.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW QUALIFY command.

---

**BROW0607I QUALIFICATION PROCESSING COMPLETED**

**Explanation:** This is the normal response to the ZBROW QUALIFY command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW QUALIFY command.

---

**BROW0649W NO QUALIFICATION SET. DEFAULTS TO DSNAME TPFDB.**

**Explanation:** A ZBROW QUALIFY command with the DISPLAY or SET parameter specified was entered, but the TPFCS qualification was not set, possibly because a ZBROW QUALIFY command with the RESET parameter specified was entered, because of an internal error, or because the browser has not been qualified.

**System Action:** The command will be rejected if a qualification is needed for processing.

**User Response:** If a qualification is needed, enter the ZBROW QUALIFY command with the SET and DS parameters specified.

See *TPF Operations* for more information about the ZBROW QUALIFY and ZOODB INIT commands.

---

**BROW0650W BROWSER NOT QUALIFIED, TPFDB ASSUMED**

**Explanation:** A ZBROW QUALIFY command with the SET and DS parameters specified either was not entered previously or was not entered since the RESET parameter was specified. As a result, TPFDB is used as the default data store qualification.

**System Action:** TPFDB is used as the data store qualification.

**User Response:** Enter the ZBROW QUALIFY command with the SET and DS parameters specified to explicitly set the qualified data store.

See *TPF Operations* for more information about the ZBROW QUALIFY command.

---

**BROW0651E QUALIFICATION NOT CHANGED, ERROR ON REQUEST**

**Explanation:** A ZBROW QUALIFY command with the SET parameter specified could not be processed because an error occurred.

**System Action:** The command is rejected.

**User Response:** Determine if the DS_SYSTEM_DICT collection is corrupted. If it is, repair the corruption. If the problem persists, contact IBM support.

See *TPF Operations* for more information about the ZBROW QUALIFY and ZOODB INIT commands.

---

**BROW0653E ERROR ACCESSING QUALIFICATION. REQUEST COMPLETE**

**Explanation:** A ZBROW QUALIFY command with the DISPLAY parameter specified could not be processed because the browser is not qualified.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW QUALIFY command again with the SET and DS parameter specified.

See *TPF Operations* for more information about the ZBROW QUALIFY command.

---

**BROW0654E HEX CONVERSION ERROR ON** *parameter* **PARAMETER**

**Where:**

*parameter*
The qualification parameter where the error was found.

**Explanation:** A ZBROW QUALIFY or ZBROW ALTER command was entered, but an error occurred because the hexadecimal value specified contained one of the following:

- An odd number of hexadecimal digits
- Digits that are not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW QUALIFY or ZBROW ALTER command again, specifying a valid hexadecimal value.

See *TPF Operations* for more information about the ZBROW QUALIFY and ZBROW ALTER commands.

**BROW0655E INDEX, VALUE, USEQUAL PARAMETERS MUTUALLY EXCLUSIVE**

**Explanation:** A ZBROW DISPLAY command was entered with the ELEMENT parameter and more than one of the INDEX, VALUE, or USEQUAL parameters specified. These parameters are mutually exclusive; only one or none can be specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW DISPLAY command with the ELEMENT parameter again, and only one or none of the INDEX, VALUE, or USEQUAL parameters specified.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

**BROW0656E RSA PARAMETER CANNOT BE USED WITH USEQUAL**

**Explanation:** A ZBROW DISPLAY command was entered with the ELEMENT parameter and both the USEQUAL and RSA parameters specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZBROW QUALIFY command with the SET parameter and the RSA parameter specified to qualify the browser with the desired relative starting address (RSA).
2. Enter the ZBROW DISPLAY command again without the RSA parameter specified.

See *TPF Operations* for more information about the ZBROW DISPLAY and ZBROW QUALIFY commands.

**BROW0658E INDEX AND SEARCH PARAMETERS MUTUALLY EXCLUSIVE**

**Explanation:** The ZBROW QUALIFY command was entered with the INDEX parameter and either the SEARCH or the SPAD parameter specified. If you specify INDEX, you cannot specify SEARCH or SPAD.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW QUALIFY command with the SET parameter and either the INDEX parameter or any of the search parameters specified.

See *TPF Operations* for more information about the ZBROW QUALIFY command.

**BROW0701I FILE ADDRESS INFORMATION DISPLAY FOR FA *farf***

**Where:**

*farf* A hexadecimal file address reference format (FARF) file address of the record whose TPF collection support (TPFCS) information is displayed.

**Explanation:** This is the normal response to the ZBROW DISPLAY command with the FA parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

**BROW0702I BROWSE OF FILE ATTRIBUTES COMPLETED**

**Explanation:** This is the normal response to the ZBROW DISPLAY command with the FA parameter specified. This message is displayed whether the ZBROW DISPLAY command was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, correct it and enter the ZBROW DISPLAY command again.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

**BROW0703I DIRECTORY - *dir***

**Where:**

*dir* The directory entry for the specified relative record number (RRN).

**Explanation:** The is the normal response to the ZBROW DISPLAY command with the RRN parameter specified.

**System Action:** The contents of the directory entry for the specified RRN follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

**BROW0710I DISPLAY OF COLLECTION COMPLETED**

**Explanation:** The is the normal response to the ZBROW DISPLAY command. This message is displayed whether the ZBROW DISPLAY command was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, correct it and enter the ZBROW DISPLAY command again.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

**BROW0751E LENGTH OF INPUT FARF IS NOT VALID**

**Explanation:** A ZBROW DISPLAY command with the FA parameter specified could not be processed because the length of the input file address reference format (FARF) was not correct.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter a valid input FARF length.
2. Enter the ZBROW DISPLAY command with the FA parameter specified again.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

**BROW0752E TPFCS FOUND NO ATTRIBUTES TO DISPLAY**

**Explanation:** An internal logic error has occurred while processing the ZBROW DISPLAY command with the FA parameter specified. This error prevents TPF collection support (TPFCS) from displaying the collection attributes of the record file address entered with the command.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine why the request failed by checking to see if other error messages were received in response to the ZBROW DISPLAY command with the FA parameter specified.
2. Enter the ZBROW DISPLAY command again specifying the FA parameter.
3. If you are unable to resolve the error, see your IBM service representative for more information.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

---

**BROW0753E RRN *rrn* IS UNASSIGNED**

**Where:**

*rrn* The relative record number (RRN).

**Explanation:** The ZBROW DISPLAY command with the RRN parameter specified was entered for an RRN that is currently not assigned.

**System Action:** None.

**User Response:** Enter the ZBROW DISPLAY command again specifying a different RRN value.

See *TPF Operations* for more information about the ZBROW DISPLAY command.

---

**BROW0754E COLLECTION IS NOT AN EXTENDED COLLECTION**

**Explanation:** A ZBROW DISPLAY command with the RRN parameter specified or a ZBROW PATH command was entered for a compact collection. These commands are only valid for extended collections because only extended collections contain the structures that the command is attempting to display.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW DISPLAY or ZBROW PATH command.

---

**BROW0801I PATH FOR SPECIFIED KEY FOR COLLECTION *colname***

**Where:**

*colname*
The name of the specified collection.

**Explanation:** This is the normal response to the ZBROW PATH command with the KEY parameter specified.

**System Action:** Information about the entries that make up the path for the specified key follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW PATH command.

---

**BROW0802I PATH FOR RRN *rrn* FOR COLLECTION *colname***

**Where:**

*rrn* The specified hexadecimal relative record number (RRN) value.

*colname*
The name of the specified collection.

**Explanation:** This is the normal response to the ZBROW PATH command with the RRN parameter specified.

**System Action:** Information about the directory entries that make up the path tree for the specified RRN follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW PATH command.

---

**BROW0803I INFORMATION FOR INDEX *index* FOR COLLECTION *colname***

**Where:**

*index*
The specified decimal index value.

*colname*
The name of the specified collection.

**Explanation:** This is the normal response to the ZBROW PATH command with the INDEX parameter specified.

**System Action:** Information about the location for the specified index number follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW PATH command.

---

**BROW0804I INFORMATION FOR RBA *rba* FOR COLLECTION *colname***

**Where:**

*rba* The specified hexadecimal relative byte address (RBA) value.

*colname*
The name of the specified collection.

**Explanation:** This is the normal response to the ZBROW PATH command with the RBA parameter specified.

**System Action:** Information about the location for the specified RBA follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW PATH command.

### BROW0810I PATH REQUEST COMPLETED

**Explanation:** This is the normal response to the ZBROW PATH command. This message is displayed whether the ZBROW PATH command was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, correct it and enter the ZBROW PATH command again.

See *TPF Operations* for more information about the ZBROW PATH command.

### BROW0850E TPFCS RETURNED NO *functionname* INFORMATION TO DISPLAY

**Where:**

*functionname*
The name of the path function being requested. The value is one of the following:
- KEY PATH
- RRN PATH
- RBA
- INDEX.

**Explanation:** An internal error occurred while attempting to process the ZBROW PATH command with the DISPLAY parameter specified. No information about the element of the requested structure was found to display by TPF collection support (TPFCS).

**System Action:** The command ends.

**User Response:** Do the following:

1. Check for other errors that preceded this message to help determine why TPFCS was unable to process the information for the specified request.
2. Correct the error.
3. See your IBM service representative if you are unable to correct the problem.

See *TPF Operations* for more information about the ZBROW PATH command.

### BROW0851E ERROR PROCESSING OUTPUT COLLECTION

**Explanation:** An internal error occurred while attempting to process the returned path information for a ZBROW PATH command.

**System Action:** The command ends.

**User Response:** Do the following:

1. Check for other errors that preceded this message to help determine why TPF collection support (TPFCS) was unable to process the information for the specified request.
2. See your IBM service representative if you are unable to correct the problem.

See *TPF Operations* for more information about the ZBROW PATH command.

### BROW0852E HEX CONVERSION ERROR ON KEY PARAMETER

**Explanation:** A ZBROW PATH command was entered with the KEY parameter specified. The command was not processed because the hexadecimal value specified for the KEY parameter contained one of the following:

- An odd number of hexadecimal digits
- Digits that are not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW PATH command again specifying a valid hexadecimal value.

See *TPF Operations* for more information about the ZBROW PATH command.

### BROW0853E KEYPATH NAME NOT VALID

**Explanation:** A ZBROW PATH command with the KEY and KEYPATH parameters specified was entered with a key path name that is not defined.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW PATH command again specifying a valid key path parameter.

See *TPF Operations* for more information about the ZBROW PATH command.

### BROW0901I KEYPATH SUCCESSFULLY ADDED

**Explanation:** This is the normal response to the ZBROW KEYPATH command with the ADD parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW KEYPATH command.

### BROW0902I KEYPATH SUCCESSFULLY REMOVED

**Explanation:** This is the normal response to the ZBROW KEYPATH command with the REMOVE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW KEYPATH command.

### BROW0903I KEYPATH INFORMATION DISPLAY

**Explanation:** This is the normal response to the ZBROW KEYPATH command with the DISPLAY parameter specified.

**System Action:** Information about the values of all attributes for the key path specified follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW KEYPATH command.

**BROW0904I NO KEYPATHS DEFINED**

**Explanation:** A ZBROW KEYPATH command with the DISPLAY parameter specified was entered for a collection that had no alternate key paths defined for it. Therefore, there is no information to display.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW KEYPATH command.

**BROW0910I KEYPATH REQUEST COMPLETED**

**Explanation:** This is the normal response to the ZBROW KEYPATH command. This message is displayed whether ZBROW KEYPATH was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, correct it and enter the ZBROW KEYPATH command again.

See *TPF Operations* for more information about the ZBROW KEYPATH command.

**BROW0951E EITHER KEYPATH NAME OR ALL MUST BE SPECIFIED**

**Explanation:** A ZBROW KEYPATH command with the DISPLAY parameter specified was entered with both a key path name and the ALL parameter specified or else neither parameter was specified. Specify a key path name or the ALL parameter, but not both.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW KEYPATH command again specifying either a key path name or the ALL parameter.

See *TPF Operations* for more information about the ZBROW KEYPATH command.

**BROW0952E MAXIMUM KEYPATHS ALREADY DEFINED**

**Explanation:** A ZBROW KEYPATH command with the ADD parameter specified was entered for a collection that already has the maximum number of key paths defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Remove a key path from the collection by entering the ZBROW KEYPATH command with the REMOVE parameter specified.
2. Add a new key path to the collection by entering the ZBROW KEYPATH command with the ADD parameter specified.

See *TPF Operations* for more information about the ZBROW KEYPATH command.

**BROW1001I RECOUP INDEX DISPLAY**

**Explanation:** This is the normal response to the ZBROW RECOUP command with the DISPLAY parameter specified. This message is followed by a display of the specified recoup index or a list of all defined recoup indexes for the qualified data store.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1011I RECOUP INDEX ENTRY SUCCESSFULLY ADDED**

**Explanation:** This is the normal response to the ZBROW RECOUP command with the ADD parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1012I RECOUP INDEX SUCCESSFULLY DEFINED**

**Explanation:** This is the normal response to the ZBROW RECOUP command with the DEFINE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1013I RECOUP INDEX SUCCESSFULLY DELETED**

**Explanation:** This is the normal response to the ZBROW RECOUP command with the DELETE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1014I RECOUP INDEX DISPLAY SUCCESSFUL**

**Explanation:** This is the normal response to the ZBROW RECOUP command with the DISPLAY parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1015I RECOUP INDEX SUCCESSFULLY LINKED**

**Explanation:** This is the normal response to the ZBROW RECOUP command with the LINK parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1016I RECOUP INDEX ENTRY SUCCESSFULLY REMOVED**

**Explanation:** This is the normal response to the ZBROW RECOUP command with the REMOVE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1017I RECOUP INDEX SUCCESSFULLY UNLINKED**

**Explanation:** This is the normal response to the ZBROW RECOUP command with the UNLINK parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1018I RECOUP INDEX IS EMPTY**

**Explanation:** The ZBROW RECOUP command was entered with the DISPLAY parameter specified, but there are no entries in the specified recoup index.

**System Action:** None.

**User Response:** Determine if the recoup index should be empty.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1051E SPECIFIED RECOUP INDEX NAME IS NOT DEFINED**

**Explanation:** The ZBROW RECOUP command was entered with an incorrect or undefined recoup index name.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW RECOUP command again specifying a defined recoup index name.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1053E ENTRY TYPE (OR ETYPE) PARAMETER VALUE NOT VALID**

**Explanation:** The ZBROW RECOUP command was entered with the ETYPE parameter specified, but the value specified for the ETYPE parameter was incorrect.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW RECOUP command again specifying the ETYPE parameter with a value of either FA or PID.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1054E KEY PARAMETER VALUE NOT VALID**

**Explanation:** The ZBROW RECOUP command was entered with the KEY parameter specified, but the value for the KEY parameter contained one of the following:

- An odd number of hexadecimal digits
- Digits that are not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW RECOUP command again specifying the KEY parameter with a correct character or hexadecimal string.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1055E RECOUP INDEX TYPE NOT VALID**

**Explanation:** The ZBROW RECOUP command with the DEFINE parameter specified was entered with an incorrect value for the recoup index type parameter for either a binary large object (BLOB), heterogeneous, or homogeneous collection.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW RECOUP command again specifying the DEFINE parameter and a valid recoup index type.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1056E EITHER INDEX OR KEY MUST BE SPECIFIED**

**Explanation:** The ZBROW RECOUP command was entered with the ADD parameter specified and both the INDEX and KEY parameters or neither of these parameters specified. You can specify the INDEX or KEY parameter, but not both.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW RECOUP command again specifying the ADD parameter and a correct value for either the INDEX or KEY parameter.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1057E EITHER INDEXNAME OR ALL MUST BE SPECIFIED**

**Explanation:** The ZBROW RECOUP command with the DISPLAY parameter specified was entered with both *indexname* and the ALL parameter specified or else neither parameter was specified. Specify *indexname* or the ALL parameter, but not both.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW RECOUP command again specifying either *indexname* or the ALL parameter.

See *TPF Operations* for more information about the ZBROW RECOUP command.

### BROW1058W INDEX OR KEY PARAMETER IGNORED

**Explanation:** The ZBROW RECOUP command with the ADD parameter specified was entered with either the INDEX or KEY parameter specified for a non-heterogeneous collection.

**System Action:** The unrelated parameter is ignored and processing continues.

**User Response:** Make sure that the recoup index entry that you just added belongs to the correct recoup index. If it does not, do the following:

1. Enter the ZBROW RECOUP command with the REMOVE parameter specified to remove the recoup index entry.
2. Enter the ZBROW RECOUP command again specifying the ADD parameter and its previously entered parameters.

See *TPF Operations* for more information about the ZBROW RECOUP command. See *TPF Database Reference* for more information about recoup indexes.

### BROW1059E SPECIFIED ENTRY TOKEN IS NOT DEFINED

**Explanation:** The ZBROW RECOUP command was entered with an incorrect or undefined entry token.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW RECOUP command again specifying a defined entry token.

See *TPF Operations* for more information about the ZBROW RECOUP command.

### BROW1061E RECOUP INDEX ADD ENTRY REQUEST FAILED

**Explanation:** The ZBROW RECOUP command with the ADD parameter specified was not completed successfully.

**System Action:** This message is accompanied by another, more specific error message.

**User Response:** Follow the instructions for the more specific error message.

See *TPF Operations* for more information about the ZBROW RECOUP command.

### BROW1062E RECOUP INDEX DEFINE REQUEST FAILED

**Explanation:** The ZBROW RECOUP command with the DEFINE parameter specified was not completed successfully.

**System Action:** This message is accompanied by another, more specific error message.

**User Response:** Follow the instructions for the more specific error message.

See *TPF Operations* for more information about the ZBROW RECOUP command.

### BROW1063E RECOUP INDEX DELETE REQUEST FAILED

**Explanation:** The ZBROW RECOUP command with the DELETE parameter specified was not completed successfully.

**System Action:** This message is accompanied by another, more specific error message.

**User Response:** Follow the instructions for the more specific error message.

See *TPF Operations* for more information about the ZBROW RECOUP command.

### BROW1064E RECOUP INDEX DISPLAY REQUEST FAILED

**Explanation:** The ZBROW RECOUP command with the DISPLAY parameter specified was not completed successfully.

**System Action:** This message is accompanied by another, more specific error message.

**User Response:** Follow the instructions for the more specific error message.

See *TPF Operations* for more information about the ZBROW RECOUP command.

### BROW1065E RECOUP INDEX LINK REQUEST FAILED

**Explanation:** The ZBROW RECOUP command with the LINK parameter specified was not completed successfully.

**System Action:** This message is accompanied by another, more specific error message.

**User Response:** Follow the instructions for the more specific error message.

See *TPF Operations* for more information about the ZBROW RECOUP command.

### BROW1066E RECOUP INDEX REMOVE ENTRY REQUEST FAILED

**Explanation:** The ZBROW RECOUP command with the REMOVE parameter specified was not completed successfully.

**System Action:** This message is accompanied by another, more specific error message.

**User Response:** Follow the instructions for the more specific error message.

See *TPF Operations* for more information about the ZBROW RECOUP command.

### BROW1067E RECOUP INDEX UNLINK REQUEST FAILED

**Explanation:** The ZBROW RECOUP command with the UNLINK parameter specified was not completed successfully.

**System Action:** This message is accompanied by another, more specific error message.

**User Response:** Follow the instructions for the more specific error message.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1070E ETOKEN ALREADY DEFINED**

**Explanation:** The ZBROW RECOUP command with the ADD parameter specified was not completed successfully because the value specified for the ETOKEN parameter was not unique.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW RECOUP command again specifying the ADD parameter and a valid entry token value that is unique.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1072E RECOUP INDEX ALREADY DEFINED**

**Explanation:** The ZBROW RECOUP command with the DEFINE parameter specified was entered, but the index name specified was previously defined. You must choose a different index name or delete the recoup index.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW RECOUP command again specifying the DEFINE parameter with a valid unique index name.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1073E ETOKEN PARAMETER VALUE NOT VALID**

**Explanation:** The ZBROW RECOUP command was entered with the ETOKEN parameter specified, but the value for the ETOKEN parameter contained one of the following:

- An odd number of hexadecimal digits
- Digits that are not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZBROW RECOUP command again specifying a valid value for the ETOKEN parameter.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1074E DS RECOUP DICTIONARY NOT FOUND**

**Explanation:** The ZBROW RECOUP command was entered with the DISPLAY and ALL parameters specified, but there is no recoup dictionary with the name DS_RECOUP in the qualified data store. This collection is needed to process the request.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative if you determine that the error is internal.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1075E NO RECOUP INDEXES DEFINED**

**Explanation:** The ZBROW RECOUP command was entered with the DISPLAY and ALL parameters specified, but the recoup dictionary is empty.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative if you determine that the error is internal.

See *TPF Operations* for more information about the ZBROW RECOUP command.

**BROW1110I ALTER REQUEST COMPLETED**

**Explanation:** This is the normal response to the ZBROW ALTER command with the ELEMENT parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW ALTER command.

**BROW1120I BEGIN DISPLAY OF THE QUALIFIED ELEMENT**

**Explanation:** This is the normal response to the ZBROW ALTER command with the ELEMENT and MODIFY parameters specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBROW ALTER command.

**BROW1151E ALTER REQUEST FAILED**

**Explanation:** The ZBROW ALTER command was entered with the ELEMENT parameter specified, but the command request was not completed successfully.

**System Action:** This message is accompanied by another, more specific error message.

**User Response:** Follow the instructions for the more specific error message.

See *TPF Operations* for more information about the ZBROW ALTER command.

**BROW1152E NO DATA SPECIFIED**

**Explanation:** The ZBROW ALTER command was entered, but no data was specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZBROW QUALIFY command to qualify the browser with the desired data.
2. Enter the ZBROW ALTER command again.

See *TPF Operations* for more information about the ZBROW ALTER and ZBROW QUALIFY commands.

**BROW1153E NO SEARCH SPECIFIED**

**Explanation:** The ZBROW ALTER command was entered with a keyed collection or a sorted collection, but no search was specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZBROW QUALIFY command to qualify the browser with the desired search field.
2. Enter the ZBROW ALTER command again.

See *TPF Operations* for more information about the ZBROW ALTER and ZBROW QUALIFY commands.

**BROW1154E NO INDEX SPECIFIED**

**Explanation:** The ZBROW ALTER command was entered with an array or a sequence collection, but no index was specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZBROW QUALIFY command to qualify the browser with the desired index.
2. Enter the ZBROW ALTER command again.

See *TPF Operations* for more information about the ZBROW ALTER and ZBROW QUALIFY commands.

**BROW1155E DATA LENGTH NOT VALID**

**Explanation:** The ZBROW ALTER command was entered, but the data length specified in the qualification is less than the actual length of the data entered, or is greater than the maximum data length of the collection.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZBROW QUALIFY command to qualify the browser with either a valid data length or a data length of zero to use the actual data length by default.
2. Enter the ZBROW ALTER command again.

See *TPF Operations* for more information about the ZBROW ALTER and ZBROW QUALIFY commands.

**BROW1156E SEARCH LENGTH NOT VALID**

**Explanation:** A ZBROW ALTER command was entered, but the length of the search field specified in the qualification is greater than the maximum collection search size.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZBROW QUALIFY command to qualify the browser with either a valid search length or a search length of zero to indicate that the actual search length should be used by default.
2. Enter the ZBROW ALTER command again.

See *TPF Operations* for more information about the ZBROW ALTER and ZBROW QUALIFY commands.

**BROW1157E** *action* **OF** *collectiontype* **DATA IS NOT ALLOWED**

**Where:**

*action*
The type of action requested (ADD, MODIFY, or DELETE).

*collectiontype*
The type of collection on which the action was requested. Other relevant collection types may be included.

**Explanation:** A ZBROW ALTER command was entered with the ADD, MODIFY, or DELETE parameter specified on a collection that currently does not support that action.

**System Action:** The command is rejected.

**User Response:** Write an application using TPF collection support (TPFCS) application programming interfaces (APIs) to perform the desired operation on the target collection.

See *TPF Operations* for more information about the ZBROW ALTER command and see the *TPF C/C++ Language Support User's Guide* for more information about the TPFCS APIs.

**BROW1158E ZBROW NOT QUALIFIED. ALTER CANNOT PROCEED.**

**Explanation:** A ZBROW ALTER command was entered, but the browser is not qualified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZBROW QUALIFY command to qualify the browser with the desired qualification.
2. Enter the ZBROW ALTER command again.

See *TPF Operations* for more information about the ZBROW ALTER and ZBROW QUALIFY commands.

**BROW1159E DLEN GREATER THAN ZERO MUST BE SPECIFIED**

**Explanation:** While working with a binary large object (BLOB) collection, the ZBROW ALTER command was entered with the DELETE parameter specified. However, either no data length was specified in the previous ZBROW QUALIFY command or the data length specified was not greater than zero.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZBROW QUALIFY command, specifying a data length for the DLEN parameter that is greater than zero.
2. Enter the ZBROW ALTER command again.

See *TPF Operations* for more information about the ZBROW ALTER and ZBROW QUALIFY commands.

# BRPT–BRV9

**BRPT0001W FACE ERROR - STATUS HISTORY CONTROL RECORD**

**Explanation:** During recoup processing, an error condition was detected by a FACE-type call while trying to locate the recoup status history control (#RGSTAT) record.

**System Action:** None.

**User Response:** None.

**BRPT0002W STATUS HISTORY CONTROL RECORD INITIALIZED DUE TO ID ERROR**

**Explanation:** Recoup processing could not find the FC3C recoup status history control (#RGSTAT) record. This is a normal message the first time recoup is run.

**System Action:** Reinitializes the recoup status history control (#RGSTAT) record.

**User Response:** None.

**BRPT0003W ALL RECOUP STATUS HISTORY RECORDS FULL**

**Explanation:** Recoup processing tried to file data to the recoup status history control (#RGSTAT) but it is full.

**System Action:** Clears the last history record and uses it.

**User Response:** None.

**BRS00000I LOAD COMPLETED**

**Explanation:** This is a response from the ZRECP LOAD ALL command. Reads the input BKD tape and writes all records on it to the file copies of the Recoup Descriptor Container records.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about online recoup and the ZRECP LOAD ALL command.

**BRTD0001I START DIRECTORY RESTORE**

**Explanation:** This is the normal response to the ZRDIR START RESTORE command indicating that the directories have begun to be restored.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRDIR START RESTORE command.

**BRTD0002I DIRECTORY RESTORE COMPLETE**

**Explanation:** This is the normal response to the ZRDIR START RESTORE command indicating that the directories have been restored.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRDIR START RESTORE command.

**BRTD0003I INVALID MESSAGE FORMAT**

**Explanation:** A ZRDIR command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about ZRDIR commands.

**BRTD0004I ALL PROCESSORS NOT IN 1052 STATE**

**Explanation:** The ZRDIR START RESTORE command was entered, but all of the processors are not in 1052 state.

**System Action:** The command is rejected.

**User Response:** Make sure all processors are in 1052 state to run the ZRDIR START RESTORE command.

See *TPF Operations* for more information about the ZRDIR START RESTORE command.

**BRTD0005E KEYPOINT 9 AND #KY9CPY FORMATS DO NOT MATCH**

**Explanation:** The ZRDIR START RESTORE command was entered, but the format of keypoint 9 and the saved copy of keypoint 9 do not match. One is in pool expansion (PXP) format and the other is in 32-way loosely coupled pool format.

**System Action:** The restore function ends. No records were restored.

**User Response:** Do the following:

1. Enter the ZPMIG command with the STATUS parameter specified to determine the format of keypoint 9.
   a. If the status is UNCONVERTED, keypoint 9 is in PXP format and the saved copy of keypoint 9 is in 32-way loosely coupled pool format. Enter the ZPMIG command with the CONVERT parameter specified to convert all pool structures to 32-way loosely coupled pool format.
   b. If the status is CONVERTED, keypoint 9 is in 32-way loosely coupled pool format and the saved copy of keypoint 9 is in PXP format. Enter the ZPMIG command with the FALLBACK parameter specified to return all pool structures to PXP format.
2. Enter the ZRDIR START RESTORE command again.

See *TPF Operations* for more information about the ZRDIR START RESTORE and the ZPMIG commands.

**BRTO0063W NO MORE FIXED ERRORS FOR THIS ID WILL BE DISPLAYED. THRESHOLD EXCEEDED.** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is

appended to the message only if the message was originally generated on a different processor.

**Explanation:** The TPF system attempted to display fixed errors related to recoup or pool directory update (PDU) processing, but the number of fixed errors exceeded the maximum number allowed by the recoup run-time options.

**System Action:** The TPF system displays only the number of fixed errors that are allowed by the recoup run-time options.

**User Response:** Do the one or both of the following:

- Change the recoup run-time options to increase the number of fixed errors that can be displayed on the CRAS console.
  1. Enter **ZRECP PROFILE DISPLAY** to display your recoup run-time options.
  2. Enter the ZRECP PROFILE command specifying the FIXERMAX parameter.
- Correct the fixed errors for the displayed record ID.

See *TPF Operations* for more information about the ZRECP PROFILE command.

---

**BRTV0003I RECOUP ACTIVITY COUNTS**

**Explanation:** This is the start of a display of recoup activity listed by pool type.

**System Action:** None.

**User Response:** None.

---

**BRUB0001E INCORRECT FORMAT - TRY ZRBKD HELP|?**

**Explanation:** The ZRBKD command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the ZRBKD command again using the correct format.

See *TPF Operations* for more information about the ZRBKD command.

---

**BRUB0002E OPTION RESTRICTED TO PRIME CRAS**

**Explanation:** The ZRBKD command was entered specifying a parameter that can only be specified from the prime CRAS.

**System Action:** The command is rejected.

**User Response:** Enter the ZRBKD command from the prime CRAS.

See *TPF Operations* for more information about the ZRBKD command.

---

**BRUB0003E REQUESTED BKD NOT FOUND**

**Explanation:** The ZRBKD command was entered specifying a recoup descriptor with the MOVE parameter, but the specified recoup descriptor could not be found.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct recoup descriptor.
2. Enter the ZRBKD command again specifying the correct recoup descriptor.

See *TPF Operations* for more information about the ZRBKD command.

---

**BRUB0004E BKDW CANNOT BE MOVED - USE DUMM OPTION**

**Explanation:** The ZRBKD command was entered specifying the BKDW recoup descriptor with the MOVE parameter, but BKDW is not allowed because it is a dummy descriptor.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct recoup descriptor.
2. Enter the ZRBKD command again specifying the correct recoup descriptor.

See *TPF Operations* for more information about the ZRBKD command.

---

**BRUB0010E UPDATES RESTRICTED DURING RECOUP CYCLE**

**Explanation:** The ZRBKD command was entered to modify recoup descriptors but modifications to the descriptors cannot be made while recoup is active.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait until recoup ends.
2. Enter the ZRBKD command again to modify recoup descriptors.

See *TPF Operations* for more information about the ZRBKD command.

---

**BRUB0012I RECOUP DESCRIPTOR TABLE**

**Explanation:** This is the normal response to the ZRBKD command with the DISP parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRBKD command.

---

**BRUB0013I RECOUP DESCRIPTOR TABLE UPDATE HISTORY**

**Explanation:** This is the normal response to the ZRBKD command with the HIST parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRBKD command.

---

**BRUC0006I REQUEST PROCESSED**

**Explanation:** This is the normal response to the ZRBKD command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRBKD command.

**BRUC0007W REQUESTED BKD NOT AVAILABLE**

**Explanation:** The ZRBKD command was entered specifying a recoup descriptor, but the recoup descriptor does not exist.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct recoup descriptor.
2. Enter the ZRBKD command again specifying the correct recoup descriptor.

See *TPF Operations* for more information about the ZRBKD command.

**BRUC0008W DUMMY BKD BKDW NOT AVAILABLE**

**Explanation:** The ZRBKD command was entered specifying the BKDW recoup descriptor with the MOVE parameter, but BKDW is not allowed because it is a dummy descriptor.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct recoup descriptor.
2. Enter the ZRBKD command again specifying the correct recoup descriptor.

See *TPF Operations* for more information about the ZRBKD command.

**BRUC0010E REQUESTED BKD IS NOT CORE RESIDENT**

**Explanation:** The ZRBKD command was entered with a recoup descriptor specified, but the recoup descriptor was not core resident.

**System Action:** The command fails.

**User Response:** Do the following:

1. Ensure that the specified recoup descriptor is defined as core resident.
2. Enter the ZRBKD command again.

See *TPF Operations* for more information about the ZRBKD command.

**BRUC0011W SLOT NUMBER REQUIRED FOR THIS BKD**

**Explanation:** The ZRBKD command was entered with the MOVE and N parameters specified, but no slot was specified with the N parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZRBKD command again specifying a correct slot number for the N parameter.

See *TPF Operations* for more information about the ZRBKD command.

**BRV00001I PSEUDO DIRECTORY INITIALIZATION COMPLETED FOR PROC -** *cpuid*

**Where:**

*cpuid*
The name of the processor.

**Explanation:** This is a normal message during recoup processing, indicating that all of the recoup pseudo directory (#SONRPE) files that have been defined and allocated on the indicated processor have been initialized.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPOOL INIT command.

**BRV00002E FACEC ERROR ON PROC -** *cpuid*'**S PSEUDO DIRECTORY INIT RECORD TYPE** *rectype*, **ORDINAL -** *ordnum*

**Where:**

*cpuid*
The name of the processor.

*rectype*
The record type of a recoup pseudo directory (#SONRPE) record.

*ordnum*
The ordinal number of recoup pseudo directory (#SONRPE) record.

**Explanation:** The ZRECP RECALL command was entered, but an error condition was detected by the FACZC macro while trying to retrieve a recoup pseudo directory (#SONRPE) initialization record.

**System Action:** The command fails and sends a SNAPC dump.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP RECALL command again.

See *TPF Operations* for more information about the ZRECP RECALL command. See *TPF System Macros* for more information about the FACZC macro.

**BRV00003E FINDC ERROR ON PROC -** *cpuid*'**S PSEUDO DIRECTORY INIT RECORD TYPE** *rectype*, **ORDINAL -** *ordnum*

**Where:**

*cpuid*
The name of the processor.

*rectype*
The record type of a recoup pseudo directory (#SONRPE) record.

*ordnum*
The ordinal number of recoup pseudo directory (#SONRPE) record.

**Explanation:** The ZRECP RECALL command was entered, but an error condition was detected by the FINDC macro while trying to retrieve a recoup pseudo directory (#SONRPE) initialization record.

**System Action:** The command fails and sends a SNAPC dump.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP RECALL command again.

See *TPF Operations* for more information about the ZRECP RECALL command. See *TPF General Macros* for more information about the FINDC macro.

---

**BRV00004E FILEC ERROR ON PROC - *cpuid*'S PSEUDO DIRECTORY INITIALIZATION RECORD TYPE *rectype*, ORDINAL - *ordnum***

**Where:**

*cpuid*
The name of the processor.

*rectype*
The record type of a recoup pseudo directory (#SONRPE) record.

*ordnum*
The ordinal number of recoup pseudo directory (#SONRPE) record.

**Explanation:** The ZRECP RECALL command was entered, but an error condition was detected by the FILNC macro while trying to retrieve a recoup pseudo directory (#SONRPE) initialization record.

**System Action:** The command fails and sends a SNAPC dump.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP RECALL command again.

See *TPF Operations* for more information about the ZRECP RECALL command. See *TPF General Macros* for more information about the FILNC macro.

---

**BRV00010W VFA DELAYED FILES DISABLED BY OPERATOR**

**Explanation:** The ZRECP RECALL command was entered, but the TPF system is above 1052 state and the ***virtual file access (VFA) disabled by operator*** indicator is on.

**System Action:** Sends the RECP0003I message and continues processing.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

**BRV00011W VFA DELAYED FILES DISABLED BY SYSTEM**

**Explanation:** The ZRECP RECALL command was entered, but the TPF system is above 1052 state and the ***virtual file access (VFA) disabled by system*** indicator is on.

**System Action:** Sends the RECP0003I message and continues processing.

**User Response:** None.

---

**BRV10007E FIND ERROR RETRIEVING KEYPOINT 9**

**Explanation:** The ZRECP RECALL command was entered, but a find-type error condition was detected while trying to retrieve keypoint 9 during pool pseudo directory initialization.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP RECALL command again.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

**BRV10008E FACE/FIND ERROR ON SONRI/RPE ORDINAL *ordnum***

**Where:**

*ordnum*
The hexadecimal ordinal number of a pool rollin directory (#SONRI) or recoup pseudo directory (#SONRPE) record.

**Explanation:** The ZRECP RECALL command was entered, but an error condition was detected by a find-type macro or a FACE-type call while trying to retrieve either a pool rollin directory (#SONRI) or recoup pseudo directory (#SONRPE) record during pool pseudo directory initialization.

**System Action:** The command fails.

**User Response:** Do the following:

1. End recoup processing abnormally.
2. Determine the cause of the problem.
3. Correct the problem.
4. Enter the ZRECP RECALL command again.

See *TPF Operations* for more information about the ZRECP RECALL command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**BRV10009E ERROR FILING SONRPE ORDINAL** *ordnum*

**Where:**

*ordnum*
The hexadecimal ordinal number of a recoup pseudo directory (#SONRPE) record.

**Explanation:** The ZRECP RECALL command was entered, but an error condition was detected while trying to file a recoup pseudo directory (#SONRPE) record.

**System Action:** The command fails.

**User Response:** Correct the hardware or software problem.

See *TPF Operations* for more information about the ZRECP RECALL command.

**BRV10010I PSEUDO DIRECTORY INIT STARTING**

**Explanation:** This is a normal response to the ZRECP RECALL command when pool pseudo directory initialization is started.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RECALL command.

**BRV10011I PSEUDO DIRECTORY INIT COMPLETED**

**Explanation:** This is a normal response to the ZRECP RECALL command when pool pseudo directory initialization is completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RECALL command.

**BRV10016E PSEUDO DIRECTORY INITIALIZATION HAS FAILED**

**Explanation:** The ZRECP RECALL command was entered, but a database error caused pool pseudo directory initialization to fail.

**System Action:** The command fails.

**User Response:** Do the following:

1. Enter the ZRECP ABORT command to end recoup processing.
2. Determine the cause of the problem.
3. Correct the problem.
4. Enter the ZRECP RECALL command again.

See *TPF Operations* for more information about the ZRECP ABORT and ZRECP RECALL commands.

**BRV20000I PDU INIT START**

**Explanation:** This is the normal response to the ZPOOL INIT command specifying the PDU parameter indicating that pool directory update (PDU) record initialization has started.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPOOL INIT command.

**BRV20001I RECOUP INIT START**

**Explanation:** This is the normal response to the ZPOOL INIT command specifying the RECOUP parameter indicating that recoup record initialization has started.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPOOL INIT command.

**BRV20002I INIT COMPLETED**

**Explanation:** This is the normal response to the ZPOOL INIT command indicating that it has completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPOOL INIT command.

**BRV20003I PSEUDO DIR INIT START**

**Explanation:** This is the normal response to the ZPOOL INIT command specifying the PSDIR parameter indicating that pseudo directory record initialization has started.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPOOL INIT command.

**BRV20009E INIT ERROR**

**Explanation:** The ZPOOL INIT command was entered, but there was a FACE, FIND, or FILE error.

**System Action:** Initialization ends with an error.

**User Response:** Investigate the database.

See *TPF Operations* for more information about the ZPOOL INIT command.

**BRV20010W** *initparm* **POOL DIRECTORY MIGRATION INCOMPLETE: DIRECTORIES OWNED BY PROCESSOR** *cpuid*

**Where:**

*initparm*
The parameter that was specified with the ZPOOL INIT command.

*cpuid*
The ID of the processor.

**Explanation:** The ZPOOL INIT command was entered, but failed to migrate all pool directory records because one or more pool directories are owned by an active processor that has not activated APAR PJ27354.

**System Action:** The command fails to migrate all directory records.

**User Response:** Do one of the following:

- If APAR PJ27354 has not been installed, do the following:
  1. Install APAR PJ27354 on the indicated processor.
  2. Do the following to cycle pool directories:
     a. Cycle down the processor to 1052 state.
     b. Cycle up the processor to NORM state.
  3. Enter the ZPOOL INIT command again.
- If APAR PJ27354 has been installed, do the following:
  1. Do the following to cycle pool directories:
     a. Cycle down the processor to 1052 state.
     b. Cycle up the processor to NORM state.
  2. Enter the ZPOOL INIT command again.

See *TPF Operations* for more information about the ZPOOL INIT command.

---

**BRV30007E DATA LEVEL MUST BE IN USE**

**Explanation:** During recoup phase 2 processing that identifies pool ordinals that were chain chased by multiple processors, data level 0 did not contain the pointer to the merged directory.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start the function again.

---

**BRV30010E ID COUNT DISCREPANCY TABLE MAY BE INCOMPLETE**

**Explanation:** During recoup phase 2 processing that identifies pool ordinals that were chain chased by multiple processors, an error condition was detected while merging pseudo directories.

**System Action:** Recoup continues processing but ID counts are probably incorrect.

**User Response:** Do the following:

1. Contact a system programmer to determine the cause of the problem.
2. Correct the problem.
3. If instructed to do so, abort recoup.

---

**BRV30011E SRM31A UPDATE ERROR**

**Explanation:** During recoup phase 2 processing that identifies pool ordinals that were chain chased by multiple processors, there was an error recording statistics to the TPFDF recoup verification database (SRM31A) while merging pseudo directories.

**System Action:** Recoup processing continues.

**User Response:** Determine cause of error for future reporting.

---

**BRV30012E FIND ERROR ON POOL RECORD** *ordnum*

**Where:**

*ordnum*
The ordinal number of a pool record.

**Explanation:** During recoup phase 2 processing that identifies pool ordinals that were chain chased by multiple processors, a find error condition was detected on a pool record while merging pseudo directories.

**System Action:** Recoup continues processing

**User Response:** Contact a system programmer to determine the cause of the error and decide if recoup should be aborted.

---

**BRV30013E POOL RECORD NOT VALID** *ordnum*

**Where:**

*ordnum*
The ordinal number of a pool record.

**Explanation:** During recoup phase 2 processing that identifies pool ordinals that were chain chased by multiple processors, an incorrect pool address caused an error while merging pseudo directories.

**System Action:** Recoup processing continues.

**User Response:** Contact a system programmer to determine the cause of the error and decide if recoup should be aborted.

---

**BRV30014E FACE ERROR ON PSEUDO DIRECTORY MERGE RECORD TYPE** *rectype* **ORDINAL -** *ordnum*

**Where:**

*rectype*
The #SONRPE*x* record type of a recoup pseudo directory record, where *x* is a number from 0 to 7.

*ordnum*
The hexadecimal ordinal number of a #SONRPE*x* record.

**Explanation:** During recoup phase 2 processing that identifies pool ordinals that were chain chased by multiple processors, an error condition was detected by a FACE-type call while trying to retrieve the pseudo directory record.

**System Action:** The function fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup processing again.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**BRV30015E FIND ERROR ON PSEUDO DIRECTORY MERGE RECORD TYPE** *rectype* **ORDINAL -** *ordnum*

**Where:**

*rectype*
The #SONRPE*x* record type of a recoup pseudo directory record, where *x* is a number from 0 to 7.

*ordnum*
The hexadecimal ordinal number of a #SONRPE*x* record.

**Explanation:** During recoup phase 2 processing that identifies pool ordinals that were chain chased by multiple processors, an error condition was detected by the FINDC or WAITC macro while trying to retrieve the #SONRPE*x* record.

**System Action:** The function fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup processing again.

See *TPF General Macros* for more information about the FINDC and WAITC macros.

---

**BRV30016E BASE PSON MISMATCH ON DIRECTORY MERGE RECORD TYPE** *rectype* **ORDINAL -** *ordnum*

**Where:**

*rectype*
The #SONRPE*x* record type of a recoup pseudo directory record, where *x* is a number from 0 to 7.

*ordnum*
The hexadecimal ordinal number of a #SONRPE*x* record.

**Explanation:** During recoup phase 2 processing that identifies pool ordinals that were chain chased by multiple processors, the CY3XORD and CY3XORD$ base pseudo ordinal numbers are not the same.

**System Action:** The function fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup processing again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BRV30017E DIRECTORY ORDINAL MISMATCH ON MERGING RECORD TYPE** *rectype* **ORDINAL -** *ordnum*

**Where:**

*rectype*
The #SONRPE*x* record type of a recoup pseudo directory record, where *x* is a number from 0 to 7.

*cpuord*
The ordinal number of the processor.

*ordnum*
The hexadecimal ordinal number of a #SONRPE*x* record.

**Explanation:** During recoup phase 2 processing that identifies pool ordinals that were chain chased by multiple processors, the CY3DIR and CY3DIR$ or CY3DON and CY3DON$ pseudo ordinal numbers are not the same.

**System Action:** The function fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup processing again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**BRV50007E DATA LEVEL MUST BE IN USE**

**Explanation:** The ZRECP CONTINUE command was entered, but data level 0 does not contain the pointer to the merged directory.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP CONTINUE command again.

See *TPF Operations* for more information about the ZRECP CONTINUE command.

---

**BRV50014E TOO MANY DIRECTORY ERRORS ENCOUNTERED**

**Explanation:** The ZRECP CONTINUE command was entered, but the limit of allowed directory errors has been met.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP CONTINUE command again.

See *TPF Operations* for more information about the ZRECP CONTINUE command.

---

**BRV50015E FIND ERROR ON MERGED DIRECTORY RECORD TYPE** *rectype*-*cpuord*, **ORDINAL -** *ordnum*

**Where:**

*rectype*
The record type of a recoup pseudo directory (#SONRPE) record.

*cpuord*
The ordinal number of the processor.

*ordnum*
The ordinal number of a merged directory record.

**Explanation:** The ZRECP CONTINUE command was entered, but an error condition was detected by the FINDC or WAITC macro while trying to find the recoup merged directory (#SONRPM) record.

**System Action:** The command fails. This message precedes message BRV50098E.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP CONTINUE command again.

See *TPF Operations* for more information about the ZRECP CONTINUE command. See *TPF General Macros* for more information about the FINDC or WAITC macro.

---

**BRV50016E** **FACE ERROR ON PSEUDO DIRECTORY MERGE RECORD TYPE** *rectype* **ORDINAL -** *ordnum*

**Where:**

*rectype*
The #SONRPE*x* record type of a recoup pseudo directory record, where *x* is a number from 0 to 7.

*ordnum*
The hexadecimal ordinal number of a #SONRPE*x* record.

**Explanation:** The ZRECP CONTINUE command was entered, but an error condition was detected by a FACE-type call while trying to retrieve the pseudo directory record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP CONTINUE command again.

See *TPF Operations* for more information about the ZRECP CONTINUE command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**BRV50017E** **FIND ERROR ON PSEUDO DIRECTORY MERGE RECORD TYPE** *rectype* **ORDINAL -** *ordnum*

**Where:**

*rectype*
The #SONRPE*x* record type of a recoup pseudo directory record, where *x* is a number from 0 to 7.

*ordnum*
The hexadecimal ordinal number of a #SONRPE*x* record.

**Explanation:** The ZRECP CONTINUE command was entered, but an error condition was detected by a FINDC or WAITC macro while trying to retrieve the #SONRPEx record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP CONTINUE command again.

See *TPF Operations* for more information about the ZRECP CONTINUE command. See *TPF General Macros* for more information about the FINDC or WAITC macro.

---

**BRV50018E** **BASE PSON MISMATCH ON DIRECTORY MERGE RECORD TYPE** *rectype* **ORDINAL -** *ordnum*

**Where:**

*rectype*
The #SONRPE*x* record type of a recoup pseudo directory record, where *x* is a number from 0 to 7.

*ordnum*
The hexadecimal ordinal number of a #SONRPE*x* record.

**Explanation:** The ZRECP CONTINUE command was entered, but the base pseudo ordinal numbers (CY3XORD and CY3XORD$) are not the same.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP CONTINUE command again.

See *TPF Operations* for more information about the ZRECP CONTINUE command.

---

**BRV50019E** **DIRECTORY ORDINAL MISMATCH ON MERGING RECORD TYPE** *rectype* **ORDINAL -** *ordnum*

**Where:**

*rectype*
The #SONRPE*x* record type of a recoup pseudo directory record, where *x* is a number from 0 to 7.

*ordnum*
The hexadecimal ordinal number of a #SONRPE*x* record.

**Explanation:** The ZRECP CONTINUE command was entered, but the directory ordinal numbers (CY3DIR and CY3DIR$ or CY3DON and CY3DON$) are not the same.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP CONTINUE command again.

See *TPF Operations* for more information about the ZRECP CONTINUE command.

---

**BRV50020E** **FACE ERROR ON MERGED DIRECTORY RECORD TYPE** *rectype*-*cpuord*, **ORDINAL -** *ordnum*

**Where:**

*rectype*
The record type of a recoup pseudo directory (#SONRPE) record.

*cpuord*
The ordinal number of the processor.

*ordnum*
The hexadecimal ordinal number of a merged directory record.

**Explanation:** The ZRECP CONTINUE command was entered, but an error condition was detected by a FACE-type call while trying to retrieve the recoup merged directory (#SONRPM) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP CONTINUE command again.

See *TPF Operations* for more information about the ZRECP CONTINUE command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

**BRV50021E** **FILE ERROR ON MERGED DIRECTORY RECORD TYPE** *rectype*-*cpuord*, **ORDINAL -** *ordnum*

**Where:**

*rectype*
The record type of a recoup pseudo directory (#SONRPE) record.

*cpuord*
The ordinal number of the processor.

*ordnum*
The hexadecimal ordinal number of a merged directory record.

**Explanation:** The ZRECP CONTINUE command was entered, but an error condition was detected by the FILNC or WAITC macro while trying to file the recoup merged directory (#SONRPM) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP CONTINUE command again.

See *TPF Operations* for more information about the ZRECP CONTINUE command. See *TPF General Macros* for more information about the FILNC or WAITC macro.

**BRV50022I** **STARTING** *devtype*-*pooltype* **IPART SLOT** *slotnbr* **PSEUDO DIRECTORY MERGE**

**Where:**

*devtype*
The type of device.

*pooltype*
The type of pool file.

*slotnbr*
The slot number of the IBM pool allocation resource table (IPART) record.

**Explanation:** This is a normal response during recoup phase 2 processing indicating that pseudo directories are being merged. All directories from all processors that are activated to run recoup are merged into the recoup merged directory (#SONRPM).

**System Action:** None.

**User Response:** None.

**BRV50023I** *devtype*-*pooltype* **IPART SLOT** *slotnbr* **PSEUDO DIRECTORY MERGE COMPLETED**

**Where:**

*devtype*
The type of device.

*pooltype*
The type of pool file.

*slotnbr*
The slot number of the IBM pool allocation resource table (IPART) record.

**Explanation:** This is a normal response during recoup phase 2 processing indicating that pseudo directories have been merged. All directories from all processors that are activated to run recoup are merged into the recoup merged directory (#SONRPM).

**System Action:** None.

**User Response:** None.

**BRV50098E** **RECOUP PAUSING... RESOLVE PROBLEM AND ENTER RESTART MESSAGE**

**Explanation:** This message follows message BRV50015E.

**System Action:** Recoup releases levels and returns to the caller.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start the function again.

**BRV60003I** **DISCREPANCY IN** *pooldev* **DUE TO DUPLICATE PROCESSING**

**Where:**

*pooldev*
is the pool type and device type.

**Explanation:** This is a normal response to the ZRECP

VERIFY command or for the recoup phase 2 verification stage indicating that the specified pool type has a discrepancy because of duplicate processing.

**System Action:** The TPF system continues to process all pool types.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP VERIFY command.

---

**BRV60004W DISCREPANCY IN *pooldev* NOT ACCOUNTED FOR. INVESTIGATE CAUSE**

**Where:**

*pooldev*
is the pool type and device type.

**Explanation:** This is a response to the ZRECP VERIFY command or for the recoup phase 2 verification stage indicating that the specified pool type has a discrepancy that is not accounted for.

**System Action:** The TPF system continues to process all pool types.

**User Response:** Determine why the pool types are in discrepancy.

See *TPF Operations* for more information about the ZRECP VERIFY command.

---

**BRV60005I ID DISCREPANCY BUILD NOT POSSIBLE DUE TO 1052 STATE OPERATION, OR STOPPED/EXITED PROCESSORS**

**Explanation:** The ZRECP VERIFY command was entered or recoup phase 2 verification is running but the TPF system is in 1052 state or recoup has been stopped or exited on a processor.

**System Action:** Recoup verification fails but recoup processing continues.

**User Response:** Correct the situation if necessary.

See *TPF Operations* for more information about the ZRECP VERIFY command.

---

**BRV60006I POOL TYPE COUNT VERIFICATION COMPLETED**

**Explanation:** This is a normal response to the ZRECP VERIFY command or for the recoup phase 2 verification stage indicating that pool type count verification has completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP VERIFY command.

---

**BRV60007W POOL DISCREPANCIES AT MAXIMUM OF 10000**

**Explanation:** The ZRECP VERIFY command was entered or recoup phase 2 verification is running and there are more than 10000 pool discrepancy records.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP VERIFY command.

---

**BRV60009E FIND/FACE ERROR READING RECP KEYPT**

**Explanation:** The ZRECP VERIFY command was entered or recoup phase 2 verification is running but there was a FIND or FACE-type call error reading the recoup keypoint.

**System Action:** The TPF system stops.

**User Response:** Correct the record error.

See *TPF Operations* for more information about the ZRECP VERIFY command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**BRV60010E INCORRECT ENTRY**

**Explanation:** The ZRECP VERIFY command was entered specifying an incorrect parameter or pool type.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the ZRECP VERIFY command again using the correct format.

See *TPF Operations* for more information about the ZRECP VERIFY command.

---

**BRV60011E ERROR ON DBRED FOR DATABASE SRM41A**

**Explanation:** The ZRECP VERIFY command was entered or recoup phase 2 verification is running, but a find error condition was detected while trying to read a recoup statistics record (#SRM41A8) in the TPFDF recoup statistics database (SRM41A).

**System Action:** The TPF system stops.

**User Response:** Determine the cause of the FIND error.

See *TPF Operations* for more information about the ZRECP VERIFY command.

---

**BRV60012E FACE ERROR OF #SRM41A8 RECORD**

**Explanation:** The ZRECP VERIFY command was entered or recoup phase 2 verification is running, but an error condition was detected by a FACE-type call while trying to read a recoup statistics record (#SRM41A8).

**System Action:** The TPF system stops.

**User Response:** Determine the cause of the FACE-type call error.

See *TPF Operations* for more information about the ZRECP VERIFY command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

**BRV60013I POOL TYPE COUNT VERIFICATION STARTED**

**Explanation:** This is a normal response to the ZRECP VERIFY command or for the recoup phase 2 verification stage indicating that pool type count verification has started.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP VERIFY command.

**BRV60014I VERIFICATION DATA BASE NOT CLEARED IN 1052 STATE**

**Explanation:** The ZRECP VERIFY command was entered, but the verification database cannot be cleared because the TPF system is in 1052 state.

**System Action:** The TPF system continues to process all pool types.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP VERIFY command.

**BRV60015I** *pooldev* **DISCREPANCY POOL SECTION:** *ipartcnt* **ID:** *srm41acnt*

**Where:**

*pooldev*
The pool type and device type.

*ipartcnt*
The in-use pool count in the IBM pool allocation resource table (IPART).

*smr41acnt*
The in-use pool count in the TPFDF recoup statistics database (SRM41A).

**Explanation:** This is a normal response to the ZRECP VERIFY command or for the recoup phase 2 verification stage indicating that there is a difference between the IPART count and SRM41A count.

**System Action:** The TPF system continues to process all pool types.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP VERIFY command.

**BRV60016I DUPLICATE PROCESSING COUNT FOR** *pooldev* **IS** *dupcnt*

**Where:**

*pooldev*
The pool type and device type.

*dupcnt*
The number of duplicate processing count.

**Explanation:** This is a normal response to the ZRECP VERIFY command or for the recoup phase 2 verification stage indicating the duplicate processing count.

**System Action:** The TPF system continues to process all pool types.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP VERIFY command.

**BRV80000E ZRECP ENTRY NOT ALLOWED IN 1052/UTIL STATE**

**Explanation:** The ZRECP DISPLAY command was entered specifying the COUNTS parameter while the TPF system is in 1052 or UTIL state. Counts for the TPFDF recoup statistics database (SRM41A) cannot be displayed while the TPF system is in 1052 or UTIL state.

**System Action:** The command is rejected.

**User Response:** If you need to display recoup phase 1 counts from the SRM41A database, cycle the TPF system to a higher state.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**BRV80002I INCORRECT ID IN BLOCK NUMBER** *ordnum*

**Where:**

*ordnum*
The ordinal number of a statistical directory record.

**Explanation:** The ZRECP DISPLAY command was entered with the COUNTS parameter specified, but the retrieved recoup statistics record (#SRM41A8) has an incorrect ID.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP DISPLAY command specifying the COUNTS parameter again.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**BRV80003I FACE ERROR IN ORDINAL NUMBER** *ordnum*

**Where:**

*ordnum*
The ordinal number of a statistical directory record.

**Explanation:** The ZRECP DISPLAY command was entered with the COUNTS parameter specified, but an error condition was detected by a FACE-type call while trying to retrieve the TPFDF recoup statistics record (#SRM41A8).

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP DISPLAY command specifying the COUNTS parameter again.

See *TPF Operations* for more information about the ZRECP DISPLAY command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**BRV80004I RECOUP IDS COUNT DISPLAY COMPLETED**

**Explanation:** This is the normal completion message from the ZRECP DISPLAY command specifying the COUNTS parameter.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BRV80005E FIND ERROR OF STATS DISPLAY RECORD**

**Explanation:** The ZRECP DISPLAY command was entered with the COUNTS parameter specified, but an error condition was detected by the FINWC macro while trying to retrieve the recoup statistics record (#SRM41A8).

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP DISPLAY command specifying the COUNTS parameter again.

See *TPF General Macros* for more information about the FINWC macro. See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BRV80006E STATS SORT ERROR**

**Explanation:** The ZRECP DISPLAY command was entered specifying the COUNTS parameter but an error has been found while sorting the statistics alphabetically by ID.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP DISPLAY command specifying the COUNTS parameter again.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BRV80007I RECOUP IDS COUNT DISPLAY STARTED**

**Explanation:** This is the normal response to the ZRECP DISPLAY command with the COUNTS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BRV90001E ZRECP ENTRY NOT ALLOWED IN 1052/UTIL STATE**

**Explanation:** The ZRECP DISPLAY command was entered specifying the VERIFY parameter but the TPF system was not in NORM state.

**System Action:** The command is rejected.

**User Response:** If the TPF system can be recycled to NORM state, do the following:

1. Recycle TPF system to NORM state.
2. Enter the ZRECP DISPLAY command again.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BRV90004E FIND ERROR ON #SRM31A8 VERIFICATION RECORD**

**Where:**

*ordnum*
The ordinal number of a recoup verification record (#SRM31A8).

**Explanation:** The ZRECP DISPLAY command was entered with the VERIFY parameter specified, but an error condition was detected by a FACS-type call while trying to retrieve a #SRM31A8 ordinal.

**System Action:** The command fails.

**User Response:** Inspect the recoup verification record (#SRM31A8).

See *TPF Operations* for more information about the ZRECP DISPLAY command. See *TPF System Macros* and *TPF Application Programming* for more information about the FACS program and the FACS interface.

---

**BRV90005E SORT ERROR ON SRM31A**

**Explanation:** The ZRECP DISPLAY command was entered with the VERIFY parameter specified, but the DFSRT macro returned an error while attempting to sort the TPFDF recoup verification database (SRM31A).

**System Action:** The command fails.

**User Response:** Inspect the TPFDF recoup verification database (SRM31A).

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BRV90006E INCORRECT ID IN BLOCK NBR** *ordnum*

**Where:**

*ordnum*
The ordinal number of a verification directory record.

**Explanation:** The ZRECP DISPLAY command was entered with the VERIFY parameter specified, but the retrieved recoup verification record (#SRM31A8) has an incorrect ID.

**System Action:** The command fails.

**User Response:** Inspect the recoup verification record (#SRM31A8).

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**BRV90008E ZRECP ENTRY VALID ONLY FOR L/C SYSTEMS**

**Explanation:** The ZRECP DISPLAY command was entered specifying the VERIFY parameter but it is only valid for loosely-coupled TPF systems.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**BRV90009I RECOUP VERIFICATION DISPLAY**

**Explanation:** This is a normal response to the ZRECP DISPLAY command with the VERIFY parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

# BRYD–B0P0

**BRYD0001I RECOUP GENERAL FILE NOT REQUESTED PLEASE DISMOUNT - RECOUP CONTINUING**

**Explanation:** The recoup general file is mounted but has not been requested for this recoup run.

**System Action:** Recoup processing continues.

**User Response:** Dismount the recoup general file.

**BRYD0002I RECOUP DIRECTORY CAPTURE TIMEOUT LIMIT REACHED - RECOUP ABORTING**

**Explanation:** Recoup directory capture processing exceeded the processing timeout limit.

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Start recoup again. If recoup times out again, do the following:
   a. Determine the cause of the problem.
   b. Correct the problem.
   c. Start recoup again.

**BRYL0013W MOUNT RPE TAPE FOR INPUT**

**Explanation:** Recoup is in phase 3 and is looking for the RPE tape to read the pseudo directories, but the tape is not mounted.

**System Action:** Recoup processing waits until the RPE tape is mounted.

**User Response:** Mount the RPE tape.

**BUFC0001I RC CONTROL UNIT CACHE ALLOCATIONS**

**Explanation:** This is the normal response to the ZBUFC ALLOCATE DISPLAY command. Following this message is a display that contains the current and target cache allocation values for 3880 Record Cache Control Units in the complex.

If you entered the ZBUFC ALLOCATE DISPLAY command without any options or with the ALL option, then the BUFC02I message accompanies this message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC ALLOCATE DISPLAY command and an example of the informational display. See *TPF Database Reference* for more information about record caching.

**BUFC0002I RCS CONTROL UNIT CACHE ALLOCATIONS**

**Explanation:** This is the normal response to the ZBUFC ALLOCATE DISPLAY command. Following this message is a display that contains the current and target cache allocation values for 3990 Record Cache Subsystem Control Units and the concurrency filter lock facility.

If you entered the ZBUFC ALLOCATE DISPLAY command without any options or with the ALL option, then the BUFC0001I message accompanies this message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC ALLOCATE DISPLAY command and an example of the informational display. See *TPF Database Reference* for more information about record caching.

**BUFC0003I STORAGE DIRECTOR/DEVICE ADDRESS – *xxxx***

**Where:**

*xxxx*
Represents a 3880 record caching device address.

**Explanation:** This is the normal response to the ZBUFC STATUS command when the ZBUFC function determines that a record caching device is attached to a 3880 Record Cache Control Unit.

The SS STATUS field in the display is an 8-bit field. Bits 0 and 1 have the following meanings:

| Bits | Function |
|---|---|
| **00** | The subsystem storage is available to the subsystem. |
| **01** | The subsystem storage is not available to the subsystem because of an internal subsystem error. |
| **10** | The subsystem storage is not available to the subsystem because of an explicit host system request (subsystem storage is made unavailable). |
| **11** | The subsystem storage is not available to the subsystem because the Subsystem Storage Mode |

switch is set so that the storage director is not permitted to access subsystem storage.

**Bit 2**

**0** The subsystem storage is initialized.

**1** The subsystem storage is not initialized.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0004I STATUS FOR DEVICE — *dddd* RCS SSID — *ssss***

**Where:**

*dddd*
Represents a 3990 record caching device address.

*ssss* Represents a 3990 Record Cache Subsystem SSID.

**Explanation:** This is the normal response to the ZBUFC STATUS command when the ZBUFC function determines that the record caching device is attached to a 3990 Record Cache Subsystem Control Unit.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC command and for an example of the informational display. See *TPF Database Reference* for more information about record caching.

---

**BUFC0005I RCS GLOBAL STATUS DISPLAY**

**Explanation:** This is the normal response to the ZBUFC STATUS RCS command. Following this message is a display that contains data obtained from the 3990 record cache subsystem status table header.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC command and for an example of the informational display. See *TPF Database Reference* for more information about record caching.

---

**BUFC0006I SCAN COMPLETED FOR CHANNEL *xxx***

**Where:**

*xxx* The channel ID.

**Explanation:** The ZBUFC ALLOCATE IMPLEMNT request completed initializing all 3880 Record Cache Control Units on the specified channel.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0007I NO CACHE RC DEVICE FOUND ON CHANNEL *xxx***

**Where:**

*xxx* The channel ID.

**Explanation:** The ZBUFC ALLOCATE IMPLEMNT request completed scanning the specified channel and did not find any 3880 Record Cache Control Units in use on the channel.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0008E INITIALIZATION FAILED FOR RC DEVICE *dddd***

**Where:**

*dddd*
Represents a record caching device address.

**Explanation:** A new ratio value or a new buffer value was specified for the 3880 Record Cache Control Units. However, the program found an error while trying to initialize device *dddd* with these new values.

**System Action:** Device *dddd* continues to run with the old values or in direct mode. The program continues with the next device.

**User Response:** See your system support personnel if corrective action is required.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0009E INITIALIZATION TIMED OUT FOR RC DEVICE *dddd***

**Where:**

*dddd*
Represents a record caching device address.

**Explanation:** A new ratio value or a new buffer value was specified for the 3880 Record Cache Control Units. However, the initialization input/output (I/O) request for the control unit for device *dddd* did not complete within 3 minutes.

**System Action:** The program continues with the next control unit on the channel.

**User Response:** See your system support personnel if corrective action is required.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0011I RCS DEVICE I/O QUEUE THRESHLD VALUE — *nnnnn***

**Where:**

*nnnnn*
Represents the maximum queue depth value for each device. Valid values range from 1 to 32767.

If you did not specify a value for the queue depth in the command, then the queue depth referenced in this message represents the current threshold value.

**Explanation:** This is the normal response to the ZBUFC THRESHLD command. The value of the queue depth is used to compute overall I/O queue threshold value for the 3990 Record Cache Subsystem. This overall value is then used to monitor the device I/O queues whenever the subsystem is operating in a degraded state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0012I DEVICE *dddd* ATTACHED TO RCS SSID *ssss***

**Where:**

*dddd*
Represents a 3990 record caching device address.

*ssss* Represents a 3990 Record Cache Subsystem SSID associated with the record caching device.

**Explanation:** This is the normal response to the ZBUFC MAP DEVICE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0013I ATTACHED DEVICE RANGE(S) FOR RCS SSID *ssss***

**Where:**

*ssss* Represents a 3990 record cache subsystem ID associated with the device.

**Explanation:** This is the normal response to the ZBUFC MAP command. Following this message is a display of the device ranges associated with 3990 Record Cache Subsystem referenced in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0014I PINNED TRACK REPORT FOR DEVICE *dddd* ON RCS SSID *ssss***

**Where:**

*dddd*
Represents a 3990 record caching device address.

*ssss* Represents a 3990 record cache subsystem ID associated with the device.

**Explanation:** This is the normal response to the ZBUFC PINNED DISPLAY command. Pinned data is reported by the track address (CCCCHHHH) and includes a description of the type of pinned data that exists.

If a starting track address was not specified in the input message, the report begins with the track address CCCCHHHH=0.

Up to eight track addresses can be displayed with each report. Since additional pinned data tracks may exist beyond the last track address displayed in the report, the last address is marked with two asterisks (**) and the following message is appended to the display:

```
MORE PINNED DATA TRACKS EXIST
USE (**) CCCCHHHH FOR NEXT REQUEST
```

In this case, you may specify this starting address in a subsequent ZBUFC PINNED DISPLAY command to get the next eight pinned track addresses.

The END OF RCS PINNED DATA REPORT message is appended to the display to indicate the end of the report.

The NO PINNED DATA TRACKS REPORTED message is appended to the header if no pinned data tracks exist for the specified device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC command and an example of the informational display. See *TPF Database Reference* for more information about record caching.

Also see the IBM 3990 Transaction Processing Facility Support RPQs for a description of the pinned track data report.

---

**BUFC0035E UNABLE TO WRITE KEYPOINT 0**

**Explanation:** The ZBUFC command found an error while trying to file the new current and target ratios in keypoint 0. The error occurred while processing the ZBUFC ALLOCATE IMPLEMNT command.

**System Action:** The request is exited.

**User Response:** See your system support personnel to report this error.

See *TPF Operations* for more information about the ZBUFC ALLOCATE IMPLEMNT command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0036E ERROR FILING RCS SSST**

**Explanation:** The ZBUFC command found an error while trying to file the new current and target ratios in the record cache subsystem status table. The error occurred while processing the ZBUFC ALLOCATE IMPLEMNT command.

**System Action:** The request is exited.

**User Response:** See your system support personnel to report this error.

See *TPF Operations* for more information about the ZBUFC ALLOCATE IMPLEMNT command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0037I ALLOCATE — CACHE ALLOCATION PENDING**

**Explanation:** This is the normal response to the ZBUFC ALLOCATE command. It indicates one of the following:

- That the target allocation values in keypoint 0 were updated for the 3880 Record Cache Control Units
- That the target allocation values in the record cache subsystem status table were updated for the 3990 Record Cache Subsystem Control Units.

The allocation values you specify are not applied until you enter the ZBUFC ALLOCATE IMPLEMNT command for the specified control units.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC ALLOCATE command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0038I ALLOCATE — RC CACHE ALLOCATION COMPLETE**

**Explanation:** This is the normal response to the ZBUFC ALLOCATE IMPLEMNT command for the 3880 Record Cache control units in the TPF system.

If you specified the ALL option on this command, BUFC0039I accompanies this message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0039I ALLOCATE — RCS CACHE ALLOCATION COMPLETE**

**Explanation:** This is the normal response to the ZBUFC ALLOCATE IMPLEMNT command for the 3990 Record Cache Subsystem control units in the TPF system

If you specified the ALL option on the command, BUFC0038I accompanies this message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC ALLOCATE IMPLEMNT command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0040W RC IMPLEMENT CURRENTLY IN PROGRESS**

**Explanation:** The ZBUFC function issues this message when you enter a ZBUFC ALLOCATE command while a ZBUFC ALLOCATE IMPLEMNT command is being processed for the 3880 Record Cache control units in the TPF system.

**System Action:** The request is exited.

**User Response:** Wait until the ZBUFC ALLOCATE IMPLEMNT command is processed and then enter the ZBUFC ALLOCATE command again, if required.

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0041W RCS IMPLEMENT CURRENTLY IN PROGRESS**

**Explanation:** The ZBUFC function issues this message when you enter a ZBUFC ALLOCATE command while a ZBUFC ALLOCATE IMPLEMNT command is being processed for the 3990 Record Cache Subsystem control units in the TPF system.

**System Action:** The request is exited.

**User Response:** Wait until the ZBUFC ALLOCATE IMPLEMNT command is processed and then enter the ZBUFC ALLOCATE command again, if required.

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0042I ZBUFC FILE RCS SSID *ssss* COMPLETE**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem SSID.

**Explanation:** This is the normal response to the ZBUFC FILE command. The 3990 Record Cache Subsystem SSID, which is referenced in the message, is associated with the device referenced in the message. This device is disabled for cache and DASD fast-write functions. Any modified data in the record cache subsystem (RCS) is destaged to the DASD surface for all attached devices associated *ssss*.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC FILE command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0043I ZBUFC FILE ALL COMPLETE**

**Explanation:** This is the normal response to the ZBUFC FILE command. Cache and DASD fast-write functions are disabled for all 3990 Record Cache Subsystems currently active in the system. Any modified data in the record cache subsystem (RCS) complex is destaged to the DASD surface for all attached devices.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC FILE command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0044I ZBUFC ENABLE RCS SSID *ssss* COMPLETE**

**Where:**

*ssss* Represents 3990 Record Cache Subsystem SSID.

**Explanation:** This is the normal response to the ZBUFC ENABLE command. The 3990 Record Cache Subsystem that is referenced in the message and all attached devices are enabled for full record caching capability, including cache and DASD fast-write functions.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC ENABLE command. See *TPF Database Reference* for more information about record caching.

**BUFC0045I ZBUFC ENABLE ALL COMPLETE**

**Explanation:** This is the normal response to the ZBUFC ENABLE command. All 3990 Record Cache Subsystems and attached devices are enabled for full record caching capability, including cache and DASD fast-write functions.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC ENABLE command. See *TPF Database Reference* for more information about record caching.

**BUFC0046I RCS SHUTDOWN STARTED**

**Explanation:** This is the normal response to the ZPSMS PR DEACTIVATE command entered on the last active TPF processor when any 3990 Record Cache Subsystems are configured. Any modified data in the record cache subsystem (RCS) complex is destaged to the DASD surface for all attached devices. The BUFC0047I message is issued when this process is completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Database Reference* for more information about record caching.

**BUFC0047I RCS SHUTDOWN COMPLETED**

**Explanation:** A record cache subsystem (RCS) shutdown operation, which started as a result of a ZPSMS PR DEACTIVATE command, completed. (See the BUFC0046I message.)

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Database Reference* for more information about record caching.

**BUFC0048E BUFC REQUEST NOT VALID AT THIS TIME**

**Explanation:** The ZBUFC function issues this message when you enter a ZBUFC command during a general file initial program load (IPL) or before the record cache subsystem (RCS) restart function is completed.

**System Action:** The request is exited.

**User Response:** Do the following:

1. Perform an IPL of the prime module or wait until the RCS restart is completed. (See the CSS002I message.).
2. Enter the ZBUFC command again.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

**BUFC0049E BUFC REQUEST ONLY VALID FROM THE BSS**

**Explanation:** The ZBUFC function issues this message when you enter a ZBUFC command from a TPF subsystem other than the basic subsystem (BSS).

**System Action:** The request is exited.

**User Response:** Enter the ZBUFC command again from the BSS.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

**BUFC0050E DEVICE ADDRESS IS NOT A CACHING DEVICE OR IS INVALID**

**Explanation:** The ZBUFC function issues this message when you enter a ZBUFC command with a device address that is not valid or one that is not attached to any record caching control unit.

**System Action:** The request is exited.

**User Response:** Enter the ZBUFC command again with a valid device address.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

**BUFC0051E BUFC UTILITY NOT OWNED BY THIS PROCESSOR**

**Explanation:** The ZBUFC function issues this message when you enter a ZBUFC FILE, ENABLE or IMPLEMNT command from a processor in a loosely coupled TPF system and the processor does not currently own the BUFC utility.

**System Action:** The ZBUFC command is rejected.

**User Response:** Do the following:

1. Enter **ZPROT ADD UT BUFC BSS** to add the BUFC utility to the processor resource ownership table (PROT).
2. Enter **ZPROT ASN UT BUFC BSS** to assign the BUFC utility to the basic subsystem (BSS) of the processor desired.

See *TPF Operations* for more information about the ZPROT commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0052E RCS TRACK RATIO VALUE OUTSIDE ACCEPTABLE RANGE**

**Explanation:** The value specified for the RCSBUF parameter in the ZBUFC ALLOCATE command is not within the 5 to 25 percent range.

**System Action:** The request is exited.

**User Response:** Enter the command again and specify a cache allocation value ranging from 5 to 25 percent for the track slot value.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0053E UNABLE TO READ KEYPOINT 0**

**Explanation:** An unrecoverable error occurred while trying to read keypoint 0 to store the new ratio or buffer values.

**System Action:** The request is exited.

**User Response:** See your system support personnel to report this error.

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0054E INPUT NON NUMERIC OR INVALID**

**Explanation:** You specified a value that is not valid on a ZBUFC command request.

**System Action:** The request is exited.

**User Response:** Enter the command again with valid values.

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0055E RC RATIO VALUE IS ZERO**

**Explanation:** One of the allocation ratios specified in the ZBUFC ALLOCATE command is equal to 0.

**System Action:** The request is exited.

**User Response:** Enter the command again and specify allocation ratios in the range 1 to 255 for record slots and 1 to 16 for track slots.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0056E INVALID ZBUFC COMMAND REQUEST ENTER: ZBUFC ? OR ZBUFC HELP FOR MESSAGE FORMAT**

**Explanation:** You entered a ZBUFC command that is not valid.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0057E I/O ERROR ENCOUNTERED ON DEVICE** *dddd*

**Where:**

*dddd*
Represents a 3880 record caching device address.

**Explanation:** A hardware error occurred when a ZBUFC command was entered to a 3880 Record Cache Control Unit.

**System Action:** The request is exited.

**User Response:** Enter the ZBUFC command again. If the error continues, notify your IBM service representative.

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0058E RCS RATIO VALUE EXCEEDS MAXIMUM**

**Explanation:** One of the allocation values specified in the ZBUFC ALLOCATE command exceeds the maximum percentage allowed.

**System Action:** The request is exited.

**User Response:** Enter the command again with the correct allocation ratios.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0059I CACHE RECOVERY REQUEST INITIATED ON DEVICE** *dddd* **RCS SSID** *ssss*

**Where:**

*dddd*
Represents a 3990 record caching device address.

*ssss* Represents a 3990 Record Cache Subsystem SSID.

**Explanation:** This is the normal response to the ZBUFC PINNED DISCARD or the ZBUFC SETCACHE command request used for record cache subsystem (RCS) cache error recovery operations. (Optionally, 3990 Record Cache Subsystem state change messages may be reported by the CYEA segment when the reporting function is enabled.)

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0060E TOTAL ALLOCATION NOT 100 PERCENT**

**Explanation:** The total percentage for all slot allocations specified in the ZBUFC ALLOCATE command is not equal to 100.

**System Action:** The request is exited.

**User Response:** Enter the request again with slot allocation values that add up to exactly 100 percent.

See *TPF Operations* for more information about the ZBUFC ALLOCATE command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0061I BUFC UTILITY OPERATION(S) STARTED TO SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem SSID.

**Explanation:** One of the ZBUFC commands (FILE, ENABLE, or IMPLEMNT) started input/output (I/O) operations to the 3990 Record Cache Subsystem SSID referenced in the message.

**System Action:** The ZBUFC function is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0062E ALLOCATE INIT OPTION NOT VALID AT THIS TIME**

**Explanation:** You specified the INIT parameter for the ZBUFC ALLOCATE command under one of the following conditions:

- The command was not entered during system restart
- The command was entered during system restart but it was not entered in response to the CSS020A ISSUE ZBUFC ALLOCATE INIT MESSAGE TO RE-ESTABLISH CURRENT RECORD SLOT ALLOCATION RATIOS output message.
- Another ECB is processing a ZBUFC ALLOCATE INIT request.

**System Action:** The ZBUFC command is rejected.

**User Response:** You cannot enter the command again unless the TPF system is in restart and the CSS00020A output message is displayed.

If the TPF system is not in restart, enter the ZBUFC ALLOCATE command (without the INIT parameter).

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0063E I/O ERROR ENCOUNTERED FOR DEVICE** *dddd* **ON RCS SSID** *ssss*

**Where:**

*dddd*
Represents a 3990 record caching subsystem device address.

*ssss* Represents a 3990 Record Cache Subsystem SSID.

**Explanation:** A hardware error occurred while trying to issue input/output (I/O) to a 3990 Record Cache Subsystem Control Unit through a ZBUFC command.

**System Action:** The request is exited.

**User Response:** Try the request again. If the error continues, see your IBM service representative.

See *TPF Operations* for more information about the ZBUFC command. See *TPF Database Reference* for more information about record caching.

---

**BUFC0064E BUFC UTILITY CURRENTLY ACTIVE**

**Explanation:** This message is issued if:

- A ZBUFC ALLOCATE IMPLEMNT command was entered while the ZBUFC FILE or ZBUFC ENABLE function was active
- A ZBUFC FILE command was entered while the ZBUFC IMPLEMNT or ZBUFC ENABLE function was active
- A ZBUFC ENABLE command was entered while the ZBUFC IMPLEMNT or ZBUFC FILE function was active.

**System Action:** The request is exited.

**User Response:** Enter the ZBUFC command again when the currently active ZBUFC function is completed.

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0065E RCS SUBSYSTEM(S) NOT DISABLED**

**Explanation:** The ZBUFC function issues this message when you enter a ZBUFC ALLOCATE IMPLEMNT command but a subsystem ID (SSID) entry in the 3990 record cache subsystem status table (SSST) indicates that a fast-write disable request was not issued to it through a ZBUFC FILE command request.

**System Action:** The request is exited.

**User Response:** Do the following:

1. Enter **ZBUFC FILE ALL** to ensure that all subsystem ID (SSID) entries in the SSST are marked as having had a fast-write disable request issued to them.
2. Enter the ZBUFC ALLOCATE IMPLEMNT command again.

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0066E DESTAGE MAY BE INCOMPLETE FOR RCS SSID** *ssss*

**Where:**

*ssss* Represents a subsystem SSID.

**Explanation:** A ZBUFC FILE command is requested but the destage of a 3990 Record Cache Subsystem did not complete successfully. This message may also occur during record cache subsystem (RCS) shutdown as the result of a ZPSMS PR DEACTIVATE command request.

**System Action:** Processing is continued.

**User Response:** Display the status of the associated RCS subsystem ID (SSID) to determine whether pinned data exists.

If pinned data exists, enter the ZBUFC PINNED DISPLAY command to determine the extent of the pinned data for the attached devices.

**Note:** A device copy operation may be required to correct a pinned data condition for a device.

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

Also see the IBM 3990 Transaction Processing Facility Support RPQs for a description of pinned data.

---

**BUFC0067E FUNCTION NOT SUPPORTED FOR THIS CONTROL UNIT**

**Explanation:** This message occurs when a ZBUFC command is entered to a device that is not a valid 3990 Record Cache Subsystem attached device.

**System Action:** The request is exited.

**User Response:** Enter the ZBUFC command again to a valid 3990 Record Cache Subsystem device.

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0068E NO REAL-TIME MODS ATTACHED TO RCS CONTROL UNIT**

**Explanation:** A ZBUFC command was entered for a device associated with a 3990 Record Cache Subsystem subsystem ID (SSID) that has no real-time modules attached.

**System Action:** The request is exited.

**User Response:** Enter the ZBUFC command again, if required, to a device associated with a 3990 Record Cache Subsystem that has real-time modules attached.

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0069E ZBUFC FUNCTION COMPLETED WITH ERRORS**

**Explanation:** A ZBUFC function completed with prior errors found.

**System Action:** The request is exited.

**User Response:** Note any related error conditions and see your system support personnel to report the error.

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0070W NO RCS SUBSYSTEM(S) CONFIGURED**

**Explanation:** A ZBUFC command request was entered requiring access to a 3990 Record Caching Subsystem but no 3990 Record Cache Subsystems are currently configured in the TPF system.

**System Action:** The ZBUFC command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the ZBUFC command.
2. Enter the ZBUFC command again by using the correct format.

See *TPF Operations* for more information about the ZBUFC commands. See *TPF Database Reference* for more information about record caching.

---

**BUFC0071W LOCKS PARAMETER IGNORED FOR NON-L/C SYSTEM**

**Explanation:** A ZBUFC ALLOCATE command request was entered with the LOCKS parameter specified but the TPF system is not using DASD locking because it was generated without the SDPS feature.

**System Action:** The LOCKS parameter is ignored and processing of the request is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC ALLOCATE command. See *TPF Database Reference* for more information about record caching.

---

**BWRA0001E FACE ERROR -** *faceid* **/** *ordnum*

**Where:**

*faceid*
A character string that identifies the FACE record type.

*ordnum*
The ordinal number of the FACE record.

**Explanation:** During recoup processing, an error condition was detected by a FACE-type call while trying to retrieve a record.

**System Action:** Recoup processing continues.

**User Response:** Determine the cause of the problem.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**BWRA0400E SELECTIVE CHAIN CHASE REQUIRED FOR: ID***recid* **VSN** *vsn* **/FILEADDR** *faddr originid*

**Where:**

*recid*
The record ID.

*vsn* The version of the record ID.

*faddr*
The file address of the record.

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup processing detected a timeout error while chain chasing a record.

**System Action:** Recoup processing fails for this record but continues chain chasing the next record.

**User Response:** Do the following:

1. Record the record ID that timed out.
2. Complete recoup processing for the remaining records.
3. Start selective recoup processing on the record ID that timed out.

See *TPF Operations* for more information about the ZRECP DISPLAY command. See *TPF Database Reference* for more information about selective recoup processing.

---

**BWRA0402W RECOUP HANG IN BPM1 AUTO PAUSE INITIATED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup has detected a hung condition and internally pauses until the currently active entry control blocks (ECBs) are completed.

**System Action:** Recoup pauses.

**User Response:** None.

---

**BWRA0403I AUTO PAUSE COMPLETE-RECOUP WILL RESUME** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** A hung condition in recoup has cleared and recoup processing resumes.

**System Action:** None.

**User Response:** None.

---

**BWRA0501E LAST 8 FINDS:** *faddrfaddr faddrfaddr faddrfaddr faddrfaddr originid*

**Where:**

*faddr*
The 4- or 8-byte file address of the record that timed out.

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup processing detected a timeout error while chain chasing a record and displays the file addresses of the last eight timeout errors to assist in problem determination.

**System Action:** Recoup processing fails for this record but continues chain chasing the next record.

**User Response:** Do the following:

1. Record the file address of the records that timed out.
2. Complete recoup processing for the remaining records.
3. Determine the cause of the problem.
4. Correct the problem.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BWRF0001I DISPLAY PROCESSING STARTED**

**Explanation:** This is the normal response to the ZRECP DISPLAY command with the REFFROM-FARF parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BWRF0002I FROM ID SEEK ID COUNT**

**Explanation:** This is the normal response to the ZRECP DISPLAY command with the REFFROM-FARF parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BWRF0007E SRM61A8 FACE ERROR - ABORTED**

**Explanation:** The ZRECP DISPLAY command was entered with the REFFROM-FARF parameter specified, but a FACE-type error occurred.

**System Action:** The command fails.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BWRF0008E SRM61A8 FIND ERROR - ABORTED**

**Explanation:** The ZRECP DISPLAY command was entered with the REFFROM-FARF parameter specified, but a FIND-type error occurred.

**System Action:** The command fails.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BWRF0009E NOT VALID WITHOUT TPFDF INSTALLED**

**Explanation:** The ZRECP DISPLAY command was entered with the REFFROM-FARF parameter specified, but TPFDF is not installed.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

---

**BXAR0001A FCAP RESTRT REQ'D**

**Explanation:** The capture function was active before the TPF system was IPLed and must be functionally restarted to continue the process.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**BXAR0002A FRST RESTRT REQ'D**

**Explanation:** The restore function was active before the TPF system was IPLed and must be functionally restarted to continue the process.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**BXAR0003E CAP/RST KYPT RD ERR. – NO RESTRT**

**Explanation:** The working copy of the capture and restore utility keypoint keypoint cannot be accessed from file. The functions included in the capture and restore utility were not restarted.

**User Response:** Determine the cause of the DDCT read error and correct it.

See *TPF Database Reference* for more information about the capture and restore utility.

**BXAR0004E CAP/RST DDCT RD ERR. — NO RESTRT**

**Explanation:** The DDCT, a logical extension of the capture and restore utility keypoint, cannot be accessed from file. The functions included in the capture and restore utility were not restarted.

**System Action:** None.

**User Response:** Determine the cause of the DDCT read error and correct it.

See *TPF Database Reference* for more information about the capture and restore utility.

**BXAR0006E CAP/RST KYPT, DDCT SYNC FIELDS UNEQUAL NO RESTRT**

**Explanation:** The synchronization fields that are maintained in the capture and restore utility keypoint and the DDCT, a logical extension of the keypoint, are not equal. This indicates that on a keypoint update request both records did not get filed before the TPF system was IPLed again.

**System Action:** None.

**User Response:** Your system programmer should determine the cause of the error and correct it.

One safe method you can use to respond is to initialize the capture and restore utility keypoint again, dismount all associated tapes, and start all functions that were active.

See *TPF Database Reference* for more information about the capture and restore utility.

**BXAR0007A START XCP RECORDING**

**Explanation:** While this processor was down, the capture function was started on another processor. In order to have a complete capture of the TPF system, exception recording must be started in this processor.

**System Action:** The cycle up is suspended until exception recording is started.

**User Response:** Start exception recording on this processor.

See *TPF Database Reference* for more information about the capture and restore utility.

**BXAR0008E INVALID DEVICE TYPE**

**Explanation:** While setting up the keypoint parameters for the various device types, the restart program detected a device type that is no longer supported. The functions included in the capture and restore utility were not restarted.

**User Response:** Do the following:

1. Determine the cause of the problem and correct it.
2. Start the function again.

See *TPF Database Reference* for more information about the capture and restore utility.

**BXAR0009A START LOGGING**

**Explanation:** While this processor was down, the logging function was started on another processor. In order to have a complete logging file for the TPF system, recording logging must be started on this processor.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**B0P00001E UNABLE TO COMPLY - NO PSEUDO DIRECTORIES AVAILABLE**

**Explanation:** The ZRECP FLUSH or ZRECP START command was entered specifying the PROC parameter, but the specified processor has no pseudo directories available.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP RESTART command again.
4. Enter the command again.

See *TPF Operations* for more information about the ZRECP FLUSH and ZRECP START commands.

**B0P00002E UNABLE TO COMPLY - PSEUDO DIRECTORIES NOT YET INITIALIZED FOR REQUESTED PROCESSOR**

**Explanation:** The ZRECP FLUSH or ZRECP START command was entered specifying the PROC parameter, but no pseudo directories for the specified processor have been initialized.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start the function again.

See *TPF Operations* for more information about the ZRECP FLUSH and ZRECP START commands.

**B0P00003I ZRECP FLUSH HAS BEEN SENT TO PROCESSOR -** *cpuid*

**Where:**

*cpuid*
The name of the processor.

**Explanation:** This is the normal response to the ZRECP FLUSH or ZRECP START command specifying the PROC parameter, indicating that the command has been sent to the specified processor.

**System Action:** None.

**User Response:** None.

**B0P00004I ZRECP FLUSH COMPLETE**

**Explanation:** This is the normal response to the ZRECP FLUSH command.

**System Action:** None.

**User Response:** None.

**B0P00005E UNABLE TO COMPLY - NO ID TABLE RECORDS AVAILABLE FOR PROCESSOR** *cpuid*

**Where:**

*cpuid*
The name of the processor.

**Explanation:** The ZRECP START command was entered specifying the PROC parameter, but there are no ID table records available for the requested processor.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP START command again.

See *TPF Operations* for more information about the ZRECP START command.

**B0P00006E ONLY FIRST 8 PROCESSORS IN THE COMPLEX MAY PARTICIPATE IN RECOUP**

**Explanation:** When entering the ZRECP PROCEED command, only one of the first eight processors in the loosely coupled complex may be specified, and only the first eight processors can particpate in a recoup run.

**System Action:** The ZRECP PROCEED command is rejected.

**User Response:** Enter the ZRECP PROCEED command again specifying one of the first eight processors in the complex.

See the *TPF Operations* for more information about the ZRECP PROCEED command.

# B1AA–B1A9

**B1AA0004I RECOUP -** *statustype sectiontype*

**Where:**

*statustype*
The type of pool section (CUR for pool sections that are currently available or deactivated on the TPF system, or NEW for pool sections that will be available or deactivated on the TPF system after the pool reallocation procedure is completed).

*sectiontype*
The type of pool section (OPMAAA for available, or OPMBBB for deactivated).

**Explanation:** This is a normal response to the ZPOOL DISPLAY command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPOOL DISPLAY command. See *TPF Database Reference* for more information about the pool generation and reallocation procedure.

**B1AA0011E FACE ERROR FOR CY7PL RECORD**

**Explanation:** The ZPOOL DISPLAY command was entered, but an error condition was detected by a FACE-type call while trying to process a pool segment table (CY7PL) record. The FACE type is not allocated or has an incorrect ordinal number.

**System Action:** The command is rejected.

**User Response:** Check the FACE table for the current pool segment table (#PSTXCUR) or new pool segment table (#PSTXNEW).

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

**B1AA0012E FIND ERROR FOR CY7PL RECORD**

**Explanation:** The ZPOOL DISPLAY command was entered, but a find error condition was detected on the current pool segment table (#PSTXCUR) or the new pool segment table (#PSTXNEW).

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Initialize the #PSTXCUR and #PSTXNEW records.
2. Enter the ZPOOL DISPLAY command again.

See *TPF Operations* for more information about the ZPOOL DISPLAY command.

---

**B1AA0013E INCORRECT FORMAT ON INPUT MESSAGE**

**Explanation:** The ZPOOL DISPLAY command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the ZPOOL DISPLAY command again using the correct format.

See *TPF Operations* for more information about the ZPOOL DISPLAY command.

---

**B1AA0014E NO INTERVALS DEFINED**

**Explanation:** The ZPOOL DISPLAY command was entered, but no pool intervals have been defined.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPOOL DISPLAY command.

---

**B1A50001I PROCESSING ITEM** *itemnbr* **ORDINALS** *begord* **THRU** *endord*

**Where:**

*itemnbr*
The number of a pool segment table (CY7PL) item that is being processed.

*begord*
The beginning ordinal number of a range of file pool directory records (FPDRs).

*endord*
The ending ordinal number of a range of FPDRs.

**Explanation:** This is the normal response to the ZSDEA command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSDEA command.

---

**B1A50002E FPDR POOL TYPE ID ERROR ORDINAL** *ordnum* **-- FPDR IGNORED**

**Where:**

*ordnum*
The ordinal number of an file pool directory record (FPDR).

**Explanation:** The ZSDEA command was entered, but the pool-type data of the FPDR does not agree with the device index.

**System Action:** The FPDR is ignored.

**User Response:** Verify the FPDR and the current pool segment table (#PSTXCUR).

See *TPF Operations* for more information about the ZSDEA command.

---

**B1A50003E SOURCE FPDR CKSUM ERROR ORDINAL** *ordnum*

**Where:**

*ordnum*
The ordinal number of a pool rollin directory (#SONRI) or a pool deactivation directory (#SONDE) record.

**Explanation:** The ZSDEA command was entered, but found a CHECKSUM error.

**System Action:** The command is rejected.

**User Response:** Contact a system programmer to determine what is corrupting the data.

See *TPF Operations* for more information about the ZSDEA command.

---

**B1A50003I --DIRECTORY OWNED-- ORDINAL** *ordnum*

**Where:**

*ordnum*
The ordinal number of a pool rollin directory (#SONRI) or a pool deactivation directory (#SONDE) record.

**Explanation:** The ZSDEA command was entered, but the #SONRI or #SONDE record is owned by a processor in a loosely-coupled TPF system.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZSDEA command.

---

**B1A50004I END OF POOL SECTION** *poolsect* **RETURN CNT** *retcnt*

**Where:**

*poolsect*
The name of the pool section that was processed by the ZSDEA command.

*retcnt*
The number of returned pool records.

**Explanation:** This is the normal response to the ZSDEA command.

See *TPF Operations* for more information about the ZSDEA command.

**System Action:** None.

**User Response:** None.

---

**B1A50005I EOJ - POOL DEACTIVATION**

**Explanation:** This is the normal response to the ZSDEA command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSDEA command.

**B1A50006I CY7PL DOES NOT DEFINE AREAS TO BE DEACTIVATED**

**Explanation:** The ZSDEA command was entered, but the pool segment table (CY7PL) does not define any areas to be deactivated.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSDEA command.

**B1A50007W CY7ITN** *itemnbr* **NOT EQUAL TO CY7B--** *cy7bval* **- ITEM SKIPPED**

**Where:**

*itemnbr*
The item number of an existing pool section in the current pool segment table (#PSTXCUR) record.

*cy7bval*
The beginning ordinal number of a range of file pool directory records (FPDRs).

**Explanation:** The ZSDEA command was entered, but the CY7PST table is incorrect. The item number (CY7ITN) does not match the value in CY7B--.

**System Action:** The remainder of the pool type chained is ignored.

**User Response:** Correct the CY7PST table.

See *TPF Operations* for more information about the ZSDEA command.

**B1A50008W FACE ERROR ON SONRI/SONDE ORDINAL** *ordnum*

**Where:**

*ordnum*
The ordinal number of a pool rollin directory (#SONRI) or a pool deactivation directory (#SONDE) record.

**Explanation:** The ZSDEA command was entered, but an error condition was detected by a FACE-type call to the #SONRI or #SONDE record.

**System Action:** Processing stops

**User Response:** Correct the CY7PST table.

See *TPF Operations* for more information about the ZSDEA command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

**B1A50009E ERROR FILING** *facetype* **ORDINAL** *ordnum*

**Where:**

*facetype*
A file address compute (FACE) program table record type of one of the following:

- pool rollin directory (#SONRI).
- pool deactivation directory (#SONDE).

*ordnum*
The ordinal number of the FACE table record type.

**Explanation:** The ZSDEA command was entered, but an error condition was detected while trying to file the #SONRI or #SONDE record.

**System Action:** The command fails.

**User Response:** Correct the hardware or software problem.

See *TPF Operations* for more information about the ZSDEA command.

**B1A50010W FIND ERROR ADDRESS -** *faddr*

**Where:**

*faddr*
The file address of the recoup pseudo directory (#SONRPE) record.

**Explanation:** The ZSDEA command was entered, but an error condition was detected while trying to read the #SONRPE record.

**System Action:** Processing stops.

**User Response:** Correct the problem.

See *TPF Operations* for more information about the ZSDEA command.

**B1A50011E KEYPOINT 9 FIND ERROR**

**Explanation:** The ZSDEA command was entered, but the TPF system has experienced a hardware or software error finding keypoint 9.

**System Action:** Processing stops.

**User Response:** Contact a system programmer to fix the hardware or software error.

See *TPF Operations* for more information about the ZSDEA command.

**B1A50012T POOL DEACTIVATION-SEVERE ERROR -TERMINATE**

**Explanation:** The ZSDEA command was entered, but a severe error condition was detected.

**System Action:** Processing stops.

**User Response:** Correct the problem.

See *TPF Operations* for more information about the ZSDEA command.

**B1A50012W KEYPOINT 9 FILE ERROR**

**Explanation:** The ZSDEA command was entered, but the TPF system has experienced a hardware or software error reading or filing keypoint 9.

**System Action:** Processing stops.

**User Response:** Contact a system programmer to fix the hardware or software error.

See *TPF Operations* for more information about the ZSDEA command.

**B1A50015E FACE ERROR FOR CY7PL RECORD**

**Explanation:** The ZSDEA command was entered, but an error condition was detected by a FACE-type call while trying to process a pool segment table (CY7PL) record. The FACE type is not allocated or has an incorrect ordinal number.

**System Action:** The command is rejected.

**User Response:** Check the FACE table for the current pool segment table (#PSTXCUR) or new pool segment table (#PSTXNEW).

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF Operations* for more information about the ZSDEA command.

**B1A50016E FIND ERROR FOR CY7PL RECORD**

**Explanation:** The ZSDEA command was entered, but a find error condition was detected on the current pool segment table (#PSTXCUR) or new pool segment table (#PSTXNEW).

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Initialize the #PSTXCUR and #PSTXNEW records.
2. Enter the command again.

See *TPF Operations* for more information about the ZSDEA command.

**B1A50017I DEACT SEQUENCE ERROR - VALID OPTION IS** *deactparm*

**Where:**

*deactparm*
The parameter that can now be specified with the ZSDEA command.

**Explanation:** The ZSDEA command was entered with a parameter specified that cannot be specified now.

**System Action:** The command is rejected.

**User Response:** Enter the ZSDEA command again specifying the parameter that can be specified now.

See *TPF Operations* for more information about the ZSDEA command.

**B1A50018I DEACT INPUT ERROR-VALID OPTIONS ARE TEST/FILE/FALLBACK**

**Explanation:** The ZSDEA command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the ZSDEA command again using the correct format.

See *TPF Operations* for more information about the ZSDEA command.

**B1A50019W CY7ITN** *itemnbr* **GREATER THAN MAX** *maxitemnbr* **- ITEM SKIPPED**

**Where:**

*itemnbr*
The number of a CY7PST item that is being processed.

*maxitemnbr*
The maximum number of items allowed in CY7PST.

**Explanation:** The ZSDEA command was entered, but the number of CY7PST items processed exceed the maximum value allowed.

**System Action:** Processing stops.

**User Response:** Correct the pool segment table (CY7PL) generation process.

See *TPF Operations* for more information about the ZSDEA command.

**B1A80004I DISPLAY OF INUSE ADDRESSES OF DEACTIVATED**

**Explanation:** This is the normal response to the ZRECP DISPLAY command specifying the DEAFA parameter.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**B1A80011E FACE ERROR FOR THE DEACTIVATED DIRECTORY**

**Explanation:** The ZRECP DISPLAY command was entered specifying the DEAFA parameter but an error condition was detected by a FACE-type call for a pool deactivation directory (#SONDE) record.

**System Action:** The command is rejected.

**User Response:** Investigate the FACE table.

See *TPF Operations* for more information about the ZRECP DISPLAY command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

**B1A80012E FIND ERROR ON DEACTIVATED DIRECTORY**

**Explanation:** The ZRECP DISPLAY command was entered specifying the DEAFA parameter but a find error condition was detected on the pool deactivation directory (#SONDE).

**System Action:** The command is rejected.

**User Response:** Investigate database.

**B1A80013E INCORRECT FORMAT ON INPUT MESSAGE**

**Explanation:** The ZRECP DISPLAY command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the ZRECP DISPLAY command again using the correct format.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**B1A80014E NO INTERVALS DEFINED**

**Explanation:** The ZRECP DISPLAY command was entered specifying the DEAFA parameter but no pool intervals for the specified pool type are being deactivated.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**B1A80016E DEACTIVATION IS NOT ACTIVE**

**Explanation:** The ZRECP DISPLAY command was entered specifying the DEAFA parameter but pool deactivation is not active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DISPLAY command.

**B1A90001I PROCESSING INTERVAL** *itemnbr* **ORDINALS** *begord* **THRU** *endord*

**Where:**

*itemnbr*
The number of a pool segment table (CY7PL) item that is being processed.

*begord*
The beginning ordinal number of a range of file pool directory records (FPDRs).

*endord*
The ending ordinal number of a range of FPDR.

**Explanation:** This is the normal response to the ZSDEA command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSDEA command.

**B1A90002I ONLINE DEACTIVATION RECORD GENERATED**

**Explanation:** This is the normal response to the ZSDEA command indicating that the online deactivation (#$C2EC) record has been generated.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSDEA command.

**B1A90006I CY7PL DOES NOT DEFINE AREAS TO BE DEACTIVATED**

**Explanation:** The ZSDEA command was entered, but the pool segment table (CY7PL) does not define any areas to be deactivated.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSDEA command.

**B1A90007W CY7ITN** *itemnbr* **NOT EQUAL TO CY7B--** *cy7bval* **- ITEM SKIPPED**

**Where:**

*itemnbr*
The number of a CY7PST item that is being processed.

*cy7bval*
The beginning ordinal number of a range of file pool directory records (FPDRs).

**Explanation:** The ZSDEA command was entered, but the CY7PST table is incorrect. The item number (CY7ITN) does not match the value in CY7B--.

**System Action:** Processing stops.

**User Response:** Correct the pool segment table (CY7PL) generation process.

See *TPF Operations* for more information about the ZSDEA command.

**B1A90007W CY7ITN** *itemnbr* **GREATER THAN MAX** *maxitemnbr* **- ITEM SKIPPED**

**Where:**

*itemnbr*
The number of a CY7PST item that is being processed.

*maxitemnbr*
The maximum number of items allowed in CY7PST.

**Explanation:** The ZSDEA command was entered, but the number of a CY7PST items processed exceed the maximum value allowed.

**System Action:** Processing stops.

**User Response:** Correct the pool segment table (CY7PL) generation process.

---

**B1A90009W NC2EC RECORD OVER FLOW**

**Explanation:** The ZSDEA command was entered, but the deactivation control exceeds the size of the online deactivation (#$C2EC) record.

**System Action:** Processing stops.

**User Response:** Define a subset of this deactivation area - deactivate a smaller area.

See *TPF Operations* for more information about the ZSDEA command.

---

**B1A90011E FACE ERROR FOR *facetype* RECORD**

**Where:**

*facetype*
The FACE table record type of the record.

**Explanation:** The ZSDEA command was entered, but an error condition was detected by a FACE-type call while trying to process the record.

**System Action:** Processing stops.

**User Response:** Allocate the record.

See *TPF Operations* for more information about the ZSDEA command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**B1A90011S FIND ERROR FOR *facetype* RECORD**

**Where:**

*facetype*
The file address compute (FACE) program table record type of the record.

**Explanation:** The ZSDEA command was entered, but an error condition was detected while trying to find the record.

**System Action:** Processing stops.

**User Response:** Correct the hardware or software error.

See *TPF Operations* for more information about the ZSDEA command.

# CACH–CBL1

---

**CACH0001I CACHE CONTROL AREA HAS NOT BEEN ALLOCATED**

**Explanation:** The ZCACH command was entered with the DISPLAY and CTL parameters specified to display the names of the current logical record caches and their addresses from main storage, but there are none currently defined.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZCACH command.

---

**CACH0002I CACHE CONTROL AREA DISPLAY**

**Explanation:** This is the normal response to the ZCACH command with the DISPLAY and CTL parameters specified to display the names of the current logical record caches and their addresses from main storage.

**System Action:** The names and addresses of the logical record caches that are currently defined in the cache control area are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZCACH command and for an example of the informational display.

---

**CACH0003E CACHE *lcache* NOT FOUND**

**Where:**

*lcache*
The name of the logical record cache.

**Explanation:** The ZCACH command was entered with the name of a logical record cache specified, but that logical record cache name was not found in the cache control area.

**System Action:** The entry control block (ECB) exits.

**User Response:** Enter the ZCACH command with the DISPLAY and CTL parameters specified to display the names of all logical record caches that are currently active.

See *TPF Operations* for more information about the ZCACH command.

---

**CACH0004I CACHE ATTRIBUTE DISPLAY**

**Explanation:** This is the normal response to the ZCACH command with the DISPLAY and ATTRIBUTE parameters specified to display specific information about the specified logical record cache and the associated coupling facility (CF).

**System Action:** Processing was completed successfully with information about the logical record cache and the associated CF displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZCACH command and for an example of the informational display.

---

**CACH0005I CACHE DATA COLLECTION COUNTER DISPLAY**

**Explanation:** This is the normal response to the ZCACH command with the DISPLAY and COUNTS parameters specified to display the current data collection counters for a specific logical record cache.

**System Action:** Processing was completed successfully with information about the current data collection counters for the specific logical record cache displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZCACH command and for an example of the informational display.

**CACH0006I CACHE SYNONYM DISPLAY**

**Explanation:** This is the normal response to the ZCACH command with the DISPLAY and SYNONYM parameters specified to display synonym chain length information for a specific logical record cache.

**System Action:** Processing was completed successfully with information about the synonym chain length (or hash entries) for the specific logical record cache displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZCACH command and for an example of the informational display.

**CACH0008E ERROR RETRIEVING COUNTERS**

**Explanation:** The ZCACH command was entered with the DISPLAY and COUNTS parameters specified to display the current data collection counters for the specified logical record cache, but an error occurred while trying to retrieve the counter values.

**System Action:** The entry control block (ECB) exits.

**User Response:** Do the following:

1. Enter the ZCACH command again.
2. If the error continues, see your system programmer to determine the cause of the problem and to correct it.

See *TPF Operations* for more information about the ZCACH command.

**CACH0009E ERROR RETRIEVING CACHE CONTROL RECORD**

**Explanation:** The ZCACH command was entered to manage the logical record caches, but an error occurred while trying to find the processor unique logical record cache control record. This error occurs if the processor unique logical record cache control record has not been initialized yet by entering at least one ZCACH command with the MODIFY parameter or the CF ENABLE parameter specified.

**System Action:** The entry control block (ECB) exits

**User Response:** Do one of the following:

- If the ZCACH command with the MODIFY or CF ENABLE parameter specified was not entered previously to initialize a logical record cache control record, enter the command now, and then enter the original ZCACH command again.
- If the ZCACH command with the MODIFY or CF ENABLE parameter specified was entered previously and the error continues, see your system programmer to determine the cause of the problem and to correct it.

See *TPF Operations* for more information about the ZCACH command.

**CACH0010E FACE ERROR ON CACHE CONTROL RECORD**

**Explanation:** The ZCACH command was entered to modify or display information about the logical record caches, but an error occurred in the file address compute (FACE) program when the file address of the processor unique logical record cache control record could not be resolved.

**System Action:** The entry control block (ECB) exits.

**User Response:** Do one of the following:

- Ensure the processor unique logical record cache control record is defined in the current FACE table (FCTB). If the processor unique logical record cache control record is defined and the error continues, see your system programmer to determine the cause of the problem and to correct it.
- If the processor unique logical record cache control record is not defined in the FCTB, define it and enter the ZCACH command again. If the error continues, see your system programmer to determine the cause of the problem and to correct it.

See *TPF Operations* for more information about the ZCACH command. See *TPF System Generation* for more information about the processor unique logical record cache control record and the FCTB.

**CACH0011E CACHE CONTROL RECORD NOT INITIALIZED, CACHE *lcache* NOT FOUND**

**Where:**

*lcache*
The name of the logical record cache.

**Explanation:** The ZCACH command was entered with the REMOVE parameter specified for the specified logical record cache, but the processor unique logical record cache control record has not been initialized yet so the specified logical record cache was not found.

**System Action:** The entry control block (ECB) exits.

**User Response:** None.

See *TPF Operations* for more information about the ZCACH command.

**CACH0013E CF, DELETE, FLUSH, MODIFY OR REMOVE MUST BE ISSUED FROM THE BSS SUBSYSTEM**

**Explanation:** The ZCACH command was entered with the CF, DELETE, FLUSH, MODIFY, or REMOVE parameter specified, but an error occurred because the command was not entered from the basic subsystem (BSS).

**System Action:** The entry control block (ECB) exits.

**User Response:** Enter the ZCACH command again from the BSS with the appropriate parameter specified.

See *TPF Operations* for more information about the ZCACH command.

**CACH0016I CACHE *lcache* SUCCESSFULLY REMOVED**

**Where:**

*lcache*
The name of the logical record cache.

**Explanation:** This is the normal response to the ZCACH command with the REMOVE parameter specified.

**System Action:** The cache definition for the specified logical

record cache is removed from the processor unique logical record cachecontrol record.

**User Response:** None.

See *TPF Operations* for more information about the ZCACH command.

---

**CACH0017I CACHE *lcache* SUCCESSFULLY MODIFIED**

**Where:**

*lcache*
The name of the logical record cache.

**Explanation:** This is the normal response to the ZCACH command with the MODIFY parameter specified to change the number of entries for the logical record cache specified in the processor unique logical record cache control record.

**System Action:** The number of entries for the logical record cache specified in the processor unique logical record cache control record is changed.

**User Response:** None.

See *TPF Operations* for more information about the ZCACH command.

---

**CACH0018E NO ENTRIES AVAILABLE IN CACHE CONTROL RECORD FOR MODIFICATION OF CACHE *lcache***

**Where:**

*lcache*
The name of the logical record cache.

**Explanation:** The ZCACH command with the MODIFY parameter specified was entered to change the number of entries for the logical record cache in the processor unique logical record cache control record, but an error occurred because the processor unique logical record cache control record contains the maximum entries allowed and has no available entries remaining to satisfy the current request.

**System Action:** The entry control block (ECB) exits.

**User Response:** Do the following:

1. Enter the ZCACH command with the DISPLAY, CTL, and FILE parameters specified to display information about the logical record caches currently defined in the processor unique logical record cache control record.
2. Determine if a definition for a logical record cache can be removed from the processor unique logical record cache control record to make room for the current request. If so, go to step 3; otherwise, there is no more action for you to take.
3. Enter the ZCACH command with the REMOVE parameter specified to remove the definition for the logical record cache from the processor unique logical record cache control record.
4. Enter the ZCACH command again with the MODIFY parameter specified to define a logical record cache in the processor unique logical record cache control record.

See *TPF Operations* for more information about the ZCACH command.

---

**CACH0019I CACHE SUPPORT ENABLED TO USE CF**

**Explanation:** This is the normal response to the ZCACH command with the CF ENABLE parameter specified to enable the processor shared caches to use coupling facilities (CFs) for cache synchronization.

**System Action:** The TPF system successfully set the indicator to allow CFs to synchronize the processor shared caches and successfully tried to connect all active processor-shared caches in all processors to the coupling facilities (CFs) that are currently defined.

**User Response:** None.

See *TPF Operations* for more information about the ZCACH command. See *TPF Database Reference* for more information about logical record cache and CF cache support.

---

**CACH0020I CACHE SUPPORT DISABLED FOR USE OF CF. ALL ACTIVE SHARED CACHES SET TO LOCAL**

**Explanation:** This is the normal response to the ZCACH command with the CF DISABLE parameter specified to disable the processor shared caches from using the coupling facility (CF) for cache synchronization.

**System Action:** The TPF system successfully reset the indicator to disallow use of the CF to synchronize the processor shared caches and successfully disconnected all active processor shared caches in all processors from the CFs.

**User Response:** None.

See *TPF Operations* for more information about the ZCACH command. See *TPF Database Reference* for more information about logical record cache and CF cache support.

---

**CACH0022I CACHE *lcache* SUCCESSFULLY DELETED**

**Where:**

*lcache*
The name of the logical record cache.

**Explanation:** This the normal response to the ZCACH command with the DELETE parameter specified.

**System Action:** The logical record cache is deleted from the processor.

**User Response:** None.

See *TPF Operations* for more information about the ZCACH command.

---

**CACH0023I CACHE *lcache* SUCCESSFULLY FLUSHED**

**Where:**

*lcache*
The name of the logical record cache.

**Explanation:** This is the normal response to the ZCACH command with the FLUSH parameter specified.

**System Action:** The entries are cleared from the logical record cache.

**User Response:** None.

See *TPF Operations* for more information about the ZCACH command.

---

**CACH0024E ERROR CONNECTING TO CF FOR CACHE** *lcache*

**Where:**

*lcache*
The name of the logical record cache.

**Explanation:** An error occurred when the processor tried to connect to the CF for cache synchronization for the logical record cache specified.

**System Action:** The entry control block (ECB) exits.

**User Response:** Review the previous messages that were displayed to determine the cause of the error and correct it.

See *TPF Database Reference* for more information about logical record cache and CF cache support.

---

**CACH0025E ERROR DISCONNECTING FROM THE CF FOR CACHE** *lcache*

**Where:**

*lcache*
The name of the logical record cache.

**Explanation:** An error occurred when the processor tried to disconnect from the coupling facility (CF) that was used for cache synchronization for the logical record cache specified.

**System Action:** The entry control block (ECB) exits.

**User Response:** Review the previous messages that were displayed to determine the cause of the error and correct it.

See *TPF Database Reference* for more information about logical record cache and CF cache support.

---

**CACH0026I CACHE CONTROL RECORD DISPLAY**

**Explanation:** This is the normal response to the ZCACH command with the DISPLAY, CTL, and FILE parameters specified.

**System Action:** The names of the logical record caches that are currently defined in the processor unique logical record cache control record and their assigned sizes are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZCACH command.

---

**CACH0027E NO LOCKING CF DEFINED, CANNOT ENABLE CF FOR CACHE**

**Explanation:** The ZCACH command was entered with the CF ENABLE parameter specified to enable the processor shared caches to use the coupling facility (CF) for cache synchronization, but no CFs have been added to the CF locking configuration by entering the ZCFLK ADD command.

**System Action:** The entry control block (ECB) exits.

**User Response:** Do the following:

1. Enter the ZCFLK ADD command to add a CF to the CF locking configuration, which then enables the CF for use as an external locking facility (XLF) so new locks can be stored on it.
2. Enter the ZCACH command again with the CF ENABLE parameter specified.

See *TPF Operations* for more information about the ZCACH andZCFLK ADD commands.

---

**CACH0032W ALL CACHES NOW OPERATING IN LOCAL MODE**

**Explanation:** An error occurred because the last coupling facility (CF) in the CF locking configuration has been lost. The logical record caches have fallen back to local mode where entries are cast out depending on the passed timeout value rather than cross invalidates from other processors.

**System Action:** The logical record caches have fallen back to local mode where entries are cast out depending on the passed timeout value rather than cross invalidates from other processors.

**User Response:** None.

See *TPF Database Reference* for more information.

---

**CACH0034W ERROR CONNECTING TO CF, CACHE** *lcache* **LEFT IN LOCAL MODE**

**Where:**

*lcache*
The name of the logical record cache.

**Explanation:** The TPF system was unable to successfully create or connect the logical record cache specified to the corresponding coupling facility (CF) cache structure.

**System Action:** The CF cache structure operates in local mode where entries are cast out depending on the passed time out value rather than the cross invalidates from other processors.

**User Response:** Do the following:

1. Determine the cause of the problem (what prevented the successful use of the CF) and correct it.
2. Enter the ZCACH command with the CF ENABLE parameter specified to enable the processor shared caches to use the CF for cache synchronization.

See *TPF Operations* for more information about the ZCACH command.

---

**CANT0001I ANT LOAD SUCCESSFUL**

**Explanation:** This is the normal response after the application name table was loaded into core successfully.

**System Action:** None.

**User Response:** None.

---

**CBC00001A UNABLE TO OBTAIN BUFFER FOR MPIF FUNCTION**

**Explanation:** While trying to obtain a Multi-Processor Interconnect Facility MPIF) buffer to perform a MPIF function, a series of failures occurred.

**System Action:** The buffer is not obtained and the requesting function is so informed. The requesting function normally generates additional messages.

**User Response:** Have your system programmer determine the cause of the error and correct it.

**CBC00002A UNABLE TO LOCATE AVAILABLE SLOT IN *tbl* TABLE.**

**Where:**

*tbl* The table name.

**Explanation:** While trying to process a connect request, no available entry was located in the table referenced in the message.

**System Action:** The connect request was not processed. The calling user function was notified and will normally generate additional messages.

**User Response:** Have your system programmer determine the cause of the error and correct it.

The number of entries to be allocated for the table in question can be changed by entering a ZMPIF SET command.

See *TPF Operations* for more information about the ZMPIF SET command.

**CBC10002A UNABLE TO LOCATE AVAILABLE SLOT IN *table* TABLE**

**Where:**

*table*
The table name.

**Explanation:** While trying to process an identify request, no available entry was located in the table referenced in the message.

**System Action:** The identify request was not processed. The calling user function was notified and will normally generate additional messages.

**User Response:** Have your system programmer determine the cause of the error and correct it.

The number of entries to be allocated for the table in question can be changed by entering a ZMPIF SET command.

See *TPF Operations* for more information about the ZMPIF SET command.

**CBC30050E CONNECTION TIME-OUT BETWEEN *user1* AND *user2* IN SYSTEM *systemname***

**Where:**

*user1*
The first user ID.

*user2*
The second user ID.

*systemname*
The TPF system name.

**Explanation:** The first user referenced in the message requested a connection with the second user in the TPF system referenced in the message. The second user did not respond within the required time period.

**System Action:** The connect request is ended. A connect failure message is sent to the TPF system referenced in the message. The connect complete exit for user *user1* is activated to provide notification that the connect request failed.

**User Response:** None.

**CBG20002W FACE ERROR ON PATH DEFINITION RECORD ORDINAL 1 — MPIF COMPLEX DATA UPDATE FAILED**

**Explanation:** While trying to update data in keypoint E, CBG2 was unable to acquire a valid file address for the path definition record (PDR), ordinal 1. Multi-Processor Interconnect Facility (MPIF) data used by CTIN on the next initial program load (IPL) may not be correct.

**System Action:** MPIF restart is aborted. The TPF system goes to 1052 state and state change is disable.

**User Response:** Have your system programmer determine the cause of the error and correct it.

MPIF data in keypoint E may need to be reinitialized by using MPIF commands. Check the 00156 system error dump for the cause of the error. It corruption is suspected, the cause should be determined.

**CBG20003W FIND ERROR ON PATH DEFINITION RECORD ORDINAL 1 — F.A. *address* – MPIF COMPLEX DATA UPDATE FAILED**

**Where:**

*address*
The address.

**Explanation:** While trying to update data in keypoint E, CBG2 was unable to retrieve the path definition record (PDR), ordinal 1. Multi-Processor Interconnect Facility (MPIF) data used by CTIN on the next initial program load (IPL) may not be correct.

**System Action:** MPIF restart is aborted. The TPF system goes to 1052 state and state change is disabled.

**User Response:** Have your system programmer determine the cause of the error and correct it. MPIF data in keypoint E may need to be reinitialized by using MPIF commands. Check the 00156 system error dump for the cause of the error. If corruption is suspected, the cause should be determined.

**CBG20004W KEYPOINT CTKE FOR PROCESSOR *pp* CANNOT BE RETRIEVED — MPIF COMPLEX DATA UPDATE FAILED**

**Where:**

*pp* The processor name.

**Explanation:** While trying to update data in keypoint E, CBG2 was unable to retrieve the keypoint (error was returned from CYYD). Multi-Processor Interconnect Facility (MPIF) data

used by CTIN on the next IPL may not be correct.

**System Action:** MPIF restart is aborted. The TPF system goes to 1052 state and state change is disabled.

**User Response:** Have your system programmer determine the cause of the error and correct it. MPIF data in keypoint E may need to be reinitialized by using MPIF commands. Check the 00156 system error dump for the cause of the error. If corruption is suspected, the cause should be determined.

---

**CBG20005W KEYPOINT CTKE FOR PROCESSOR *pp* CANNOT BE FILED — MPIF COMPLEX DATA UPDATE FAILED**

**Where:**

*pp* The processor name.

**Explanation:** While trying to rebuild data in keypoint E, CBG2 was unable to file the updated keypoint (error returned from CYYB). Multi-Processor Interconnect Facility (MPIF) data used by CTIN on the next initial program load (IPL) may not be correct.

**System Action:** MPIF restart is aborted. The TPF system goes to 1052 state and state change is disabled.

**User Response:** Have your system programmer determine the cause of the error and correct it. MPIF data in keypoint E may need to be reinitialized by using MPIF commands. Check the 00156 system error dump for the cause of the error. If corruption is suspected, the cause should be determined.

---

**CBG20006W FILE ERROR ON PATH DEFINITION RECORD ORDINAL 1 — F.A. *address* – MPIF COMPLEX DATA UPDATE FAILED**

**Where:**

*address*
The address.

**Explanation:** CBG2 was unable to file the path definition record (PDR), ordinal 1. Multi-Processor Interconnect Facility (MPIF) data used by CTIN on the next initial program load (IPL) may not be correct.

**System Action:** MPIF restart is aborted. The TPF system goes to 1052 state and state change is disabled.

**User Response:** Have your system programmer determine the cause of the error and correct it. MPIF data in keypoint E may need to be reinitialized by using MPIF commands. Check the 00156 system error dump for the cause of the error. If corruption is suspected, the cause should be determined.

---

**CBG20051I MPIF CONVERSION COMPLETE, PDR RECORDS ARE NOW SAFE FOR GREATER THAN 8-WAY LOOSELY COUPLED**

**Explanation:** This is the normal response to the ZMIGR command with the MPIF and CONVERT parameters specified.

**System Action:** #PDREC ordinal 2 and #PDREC ordinal 3 are copied to #IBMM4 ordinal X'A9' and #IBMM4 ordinal X'AA' respectively as save areas for fallback. #PDREC ordinals 2 and 3 are initialized for use as an extension of Multiprocessor Processor Interconnect Facility (MPIF) system data to support 32 processors.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

---

**CBG20052I MPIF FALLBACK COMPLETE, PDR RECORDS ARE NOT SAFE FOR GREATER THAN 8-WAY LOOSELY COUPLED**

**Explanation:** This is the normal response to the ZMIGR command with the MPIF and FALLBACK parameters specified.

**System Action:** #PDREC ordinal 2 and #PDREC ordinal 3 are copied from #IBMM4 ordinal X'A9' and #IBMM4 ordinal X'AA' respectively. PDREC ordinals 2 and 3 are not used as an extension of Multiprocessor Processor Interconnect Facility (MPIF) system data to support 32 processors.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

---

**CBG20053I MPIF IS NOT CONVERTED FOR GREATER THAN 8-WAY LOOSELY COUPLED**

**Explanation:** This is the normal response to the ZMIGR command with the MPIF and STATUS parameters specified.

**System Action:** The current state of Multiprocessor Processor Interconnect Facility (MPIF) readiness for greater than 8-way loosely coupled processors is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

---

**CBG20054I MPIF IS CONVERTED FOR GREATER THAN 8-WAY LOOSELY COUPLED**

**Explanation:** This is the normal response to the ZMIGR command with the MPIF and STATUS parameters specified.

**System Action:** The current state of Multiprocessor Processor Interconnect Facility (MPIF) readiness for greater than 8-way loosely coupled processors is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

---

**CBI00002A UNABLE TO LOCATE AVAILABLE SLOT IN *table* TABLE.**

**Where:**

*table*
The table name.

**Explanation:** While trying to process an identify request no available entry was located in the table referenced in the message.

**System Action:** The identify request was not processed. The calling user function was notified and normally generates additional messages.

**User Response:** Have your system programmer determine the cause of the error and correct it. The number of entries to

be allocated for the table in question can be changed by entering a ZMPIF SET command.

See *TPF Operations* for more information about the ZMPIF SET command.

---

**CBJ00002A UNABLE TO LOCATE AVAILABLE SLOT IN *table* TABLE.**

**Where:**

*table*
The table name.

**Explanation:** While trying to process a query request no available entry was located in the table referenced in the message.

**System Action:** The query request was not processed. The calling user function was notified and normally generates additional messages.

**User Response:** Have your system programmer determine the cause of the error and correct it. The number of entries to be allocated for the table in question can be changed by entering a ZMPIF SET command.

See *TPF Operations* for more information about the ZMPIF SET command.

---

**CBL00001I STOP PATH WITH QUIESCE COMPLETED FOR PATH *path***

**Where:**

*path*
The path name.

**Explanation:** A stop path purge–no request completed for the path referenced in the message.

**System Action:** None.

**User Response:** None.

---

**CBL10040W LOST INTERRUPT HAS OCCURRED ON PATH *path*, PATH HALTED**

**Where:**

*path*
The path name.

**Explanation:** The Multi-Processor Interconnect Facility (MPIF) path monitor detected a potential lost interrupt on the path referenced in the message.

**System Action:** The path is halted and the associated device links are primed again.

**User Response:** None.

# CBOT–CCIM

---

**CBOT0001E UNABLE TO INITIALIZE FILE SYSTEM**

**Explanation:** File system initialization was not completed successfully because a record code check (RCC) was not received while reading #INODE fixed file record 0. Most likely, the file system is already initialized. If you initialize the file system again, the file system will remove all files and directories.

**System Action:** File system initialization was rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZFINT command.

---

**CBOT0002E ERROR INITIALIZING FILE SYSTEM**

**Explanation:** File system initialization was not completed successfully because you entered the ZFINT command after installing both file system support and TPF collection support (TPFCS) on your TPF system. If you are installing both file system support and TPFCS at the same time, you must enter the ZOODB INIT command, which makes it unnecessary for you to enter the ZFINT command.

**System Action:** The initialization request was rejected.

**User Response:** See your IBM representative to determine the cause of the error.

See *TPF Operations* for more information about the ZFINT and ZOODB INIT commands.

---

**CBOT0004I FILE SYSTEM INITIALIZATION COMPLETE**

**Explanation:** File system initialization was completed successfully.

**System Action:** None.

**User Response:** None.

---

**CBOT0005E NO INODE OR FLOCK RECORDS AVAILABLE**

**Explanation:** The file system has been installed, but no #INODE or #FLOCK fixed file records have been allocated.

**System Action:** None.

**User Response:** Load a new file address compute program (FACE) table containing the new records.

See *TPF System Generation* for more information about #INODE and #FLOCK fixed file records.

---

**CBOT0006I *i* OF *j* INODE AND FLOCK RECORDS AND *m* OF *n* IZERO RECORDS WILL BE INITIALIZED**

**Where:**

*i* The number of #INODE and #FLOCK fixed file records that are initialized.

*j* The total number of #INODE and #FLOCK fixed file records.

*m* The number of #IZERO fixed file records that are initialized.

*n* The total number of #IZERO fixed file records.

**Explanation:** Not all of the requested #INODE and #FLOCK fixed file records were allocated because the ratio of #INODE and #FLOCK fixed file records to the number of #IZERO fixed file records is not correct.

**System Action:** Some #INODE and #IZERO fixed file records are initialized.

**User Response:** Do the following:

1. Load a new file address compute program (FACE) table that contains additional #IZERO fixed file records in order to maximize the use of all the #INODE fixed file records.
2. Initialize the file system using the ZFINT command with the ON parameter specified.

See *TPF Operations* for more information about the ZFINT command.

---

**CBOT0007E FILE SYSTEM NOT INITIALIZED. TOO FEW INODE RECORDS AVAILABLE.**

**Explanation:** There are not enough #INODE fixed file records (the minimum is 1000) to fit into 1 #IZERO fixed file record.

**System Action:** The file system is not initialized.

**User Response:** Load a new file address compute program (FACE) table with at least the minimum of 1000 #INODE and #FLOCK fixed file records.

---

**CBOT0008E NO IZERO RECORDS AVAILABLE**

**Explanation:** No #IZERO records were allocated on the TPF system.

**System Action:** The file system is not initialized.

**User Response:** Do the following:

1. Load a new file address compute program (FACE) table that contains #IZERO records.
2. Initialize the file system using the ZFINT command with the ON parameter specified.

---

**CBOT0009I FILE SYSTEM INITIALIZATION COMPLETED WITH *i* INODE/FLOCK RECORDS ALLOCATED**

**Where:**

*i* The number of #INODE and #FLOCK fixed file records.

**Explanation:** The file system has completed initialization. The number of #INODE and #FLOCK fixed file records indicated in the message are available for use.

**System Action:** None.

**User Response:** None.

---

**CBR00001E MPIF RESTART FAILED — *reason***

**Where:**

*reason*
One of the reason texts listed in the explanation that follows.

**Explanation:** The following reason text can be given:

**PDR FACE ERROR**
The file address compute program (FACE) detected an error during computation of a file address for a Path Definition record (PDR).

**PDR FIND ERROR**
While trying to retrieve a PDR, an error was returned from the find for the record.

**NO SSCT SLOTS**
No slots exist for the system-to-system control table (SSCT).

**NO PDT SLOTS**
No slots exist for the path definition table (PDT).

**NO BUFFER SPACE AVAILABLE**
The Multi-Processor Interconnect Facility (MPIF) buffer pool size is insufficient to satisfy the buffer requirements for the number of defined paths.

**IDENTIFY FAILURE**
MPIF could not identify itself. The RFND or GFND tables were not defined.

**System Action:** MPIF restart is ended. TPF system restart is allowed to continue to 1052 state.

**User Response:** Correct the error condition by entering the appropriate command.

See *TPF Operations* for more information about the MPIF commands.

---

**CBR00002E MPIF RESTART ERROR – *reason***

**Where:**

*reason*
One of the reason texts listed in the explanation that follows.

**Explanation:** The following reason text can be given:

**EXCEED SSCT SIZE**
The system-to-system control table (SSCT) is full.

**EXCEED PDT SIZE**
The path definition table (PDT) is full.

One of the following errors occurred:

- If the reason is EXCEED SSCT SIZE, either:
  - The ZMPIF SET COMPLEX,NSYSTEM– parameter must be increased to allow more space in the SSCT
  - Paths to TPF systems that are not in this MPIF complex must be deleted by entering the ZMPIF DELETE command.
- If the reason is EXCEED PDT SIZE, it is possible that keypoint CTKE was no correctly updated during one or more ZMPIF DEFINE PATH commands. This results in an incorrect allocation of storage during TPF system restart.

**System Action:** Multi-Processor Interconnect Facility (MPIF) restart continues with the portion of the initialization that was successful.

**User Response:** Enter the appropriate command to correct the problem. Changes become effective on the next hardware IPL.

---

**CBR00006A MPIF RESTART DETECTS BUFFER SIZE MISMATCH. HARD-IPL REQUIRED TO CONTINUE.**

**Explanation:** Multi-Processor Interconnect Facility (MPIF) buffer pool size is insufficient to satisfy the buffer requirements for the number of defined paths. This error may be caused because of an increase in size of a system work block (SWB) entry. Since storage for MPIF buffers are allocated taking the size of an SWB into account, a prior SWB size (saved in keypoint E) may cause an insufficient amount of storage to be allocated.

**System Action:** TPF restart is exited.

**User Response:** Perform a hard initial program load (IPL).

**CBR10001E MPIF DATA IN *record type* CANNOT BE ACCESSED DUE TO RECORD ID ERROR SPECIFY OPTION: TO INITIALIZE PATH DEFINITION RECORDS — ENTER: ZMPIF *record abbreviation* INIT TO BYPASS THE INITIALIZATION AND ABORT MPIF RESTART: ZMPIF *record abbreviation* BYPASS**

**Where:**

*record type*
One of the following:
- PATH DEFINITION RECORD
- HARDWARE TABLE RECORD.

*record abbreviation*
One of the following:
- PDR for PATH DEFINITION RECORD
- HDW for HARDWARE TABLE RECORD.

**Explanation:** The path definition records (PDRs) or hardware table records (HDWs) were not initialized with the correct record identification.

**System Action:** Restart is suspended pending an operator response. The System Action for the Explanations discussed with the Explanations.

**User Response:** Do the following:

1. If record destruction is suspected, have your system programmer determine the cause of the error and correct it.
2. Enter the correct ZMPIF PDR or ZMPIF HDW command.

   **Notes:**

   a. If the records are not initialized by using the Multi-Processor Interconnect Facility (MPIF) commands, message CBR10001E is repeated for each TPF system IPL.

   b. For PDRs, the ZMPIF PDR command with the INIT parameter specified initializes only uninitialized PDRs for that processor. You would normally use this command when a new processor enters a MPIF complex. To initialize all PDRs on all processors, use the ZMPIF PDR command with the INIT and ALL parameters specified.

See *TPF Operations* for more information about the ZMPIF PDR or ZMPIF HDW command.

**CBR10002E MPIF RESTART FAILED – *reason***

**Where:**

*reason*
One of the reason texts listed in the explanation that follows.

**Explanation:** The following reason text can be given:

**PATH DEFINITION RECORD FACE ERROR**
The file address compute (FACE) program detected an error during computation of a file address for a path definition record (PDR).

**PATH DEFINITION RECORD FIND ERROR**
While trying to retrieve a PDR, a find error was returned for the record. This error may have occurred while attempting to convert the Multi-Processor Interconnect Facility (MPIF) processor unique path definition records from #PDREC records to #PDREU records.

**HARDWARE TABLE RECORD FACE ERROR**
The FACE program detected an error during computation of a file address for a hardware table record (HDW).

**HARDWARE TABLE RECORD FIND ERROR**
While trying to retrieve an HDW, an error was returned from the find for the record. This error may have occurred while attempting to convert the MPIF hardware table records from #CB8HD records to #HDREC records.

**PATH DEFINITION RECORDS DO NOT CONTAIN DATA**
The Path Definition records (PDRs) do not contain data following initialization. Without appropriate data in these records, MPIF is not functional.

The MPIF data contained in the PDRs must be created by entering the ZMPIF SET and the ZMPIF DEFIND commands.

**PATH DEFINITION RECORDS ARE NOT INITIALIZED**
The PDRs were not initialized and cannot be accessed. Without accessing data in these records, MPIF is not functional.

**HARDWARE TABLE RECORDS DO NOT CONTAIN DATA**
The hardware table records (HDWs) do not contain data following initialization. Without appropriate data in these records, MPIF is not functional.

The MPIF data contained in the HDWs must be created by entering the ZMPIF DEFINE DEVICE command.

**HARDWARE TABLE RECORDS ARE NOT INITIALIZED**
The HDWs were not initialized and cannot accessed. Without accessing data in these records, MPIF is not functional.

**KEYPOINT RECORD E CANNOT BE UPDATED**
The MPIF data cannot be updated in CTKE (the keypoint cannot be retrieved or cannot be filed). The MPIF data contained in CTKE may not be accurate in reflecting the Path Definition record (PDR) initialization or the HDW record initialization.

**System Action:** MPIF restart is ended. TPF system restart is allowed to continue to 1052 state.

**User Response:** Do the following:

1. Enter the appropriate command to resolve and correct the error.

2. Have your system programmer determine the cause of the FACE errors, FIND errors, or problems with keypoint E (CTKE) and correct the error, if necessary.

See *TPF Operations* for more information about the ZMPIF PDR or ZMPIF HDW command.

---

**CBR10003I FILE COPY CONVERSION OF MPIF HARDWARE TABLE RECORDS SUCCESSFUL**

**Explanation:** Multi-Processor Interconnect Facility (MPIF) restart conversion of the MPIF hardware table records from #CB8HD records to #HDREC records was completed successfully.

**System Action:** TPF restart continues.

**User Response:** None.

See *TPF Multi-Processor Interconnect Facility Reference* for more information about MPIF.

---

**CBR10004I FILE COPY CONVERSION OF MPIF PATH DEFINITION RECORDS SUCCESSFUL**

**Explanation:** Multi-Processor Interconnect Facility (MPIF) restart conversion of the MPIF processor unique path definition records from #PDREC records to #PDREU records was completed successfully.

**System Action:** TPF restart continues.

**User Response:** None.

See *TPF Multi-Processor Interconnect Facility Reference* for more information about MPIF.

---

**CBR20002E FACE ERROR ON PATH DEFINITION RECORD — ORDINAL 1 — MPIF RESTART ABORTED**

**Explanation:** While trying to rebuild data in keypoint E, CBR2 was unable to acquire a valid file address for the path definition record (PDR), ordinal 1. Multi-Processor Interconnect Facility (MPIF) data used by CTIN on the next initial program load (IPL) may not be correct.

**System Action:** MPIF restart is aborted. The TPF system continues to 1052 state.

**User Response:** Have your system programmer determine the cause of the error and correct it. MPIF data in keypoint E may need to be reinitialized by using MPIF commands. Check the 00156 system error dump for the cause of the error.

The recovery may have been necessary because of:

- A keypoint being loaded from the general file
- An IPL occurring that used old copies of the keypoint
- Corruption occurring.

If corruption is suspected, the cause should be determined.

---

**CBR20003E FIND ERROR ON PATH DEFINITION RECORD — F.A. *address* — ORDINAL 1 — MPIF RESTART ABORTED**

**Where:**

*address*
The address.

**Explanation:** While trying to rebuild data in keypoint E, CBR2 was unable to retrieve the Path Definition record (PDR), Ordinal 1. Multi-Processor Interconnect Facility (MPIF) data used by CTIN on the next IPL may not be correct.

**System Action:** MPIF restart is aborted. The TPF system continues to 1052 state.

**User Response:** Have your system programmer determine the cause of the error and correct it using the system error dump (00156). MPIF data in keypoint E may need to be reinitialized by using MPIF commands.

The recovery may have been necessary because of:

- A keypoint being loaded from the general file
- An IPL occurring that used old copies of the keypoint
- Corruption occurring.

---

**CBR20004E KEYPOINT CTKE CANNOT BE RETRIEVED – MPIF RESTART ABORTED**

**Explanation:** While trying to rebuild data in keypoint E, CBR2 was unable to retrieve the Path Definition record (PDR), Ordinal 1. Multi-Processor Interconnect Facility (MPIF) data used by CTIN on the next IPL may not be correct.

**System Action:** MPIF restart is aborted. The TPF system continues to 1052 state.

**User Response:** Have your system programmer determine the cause of the error and correct it using the system error dump (00156). MPIF data in keypoint E may need to be reinitialized by using MPIF commands.

The recovery may have been necessary because of:

- A keypoint being loaded from the general file
- An IPL occurring that used old copies of the keypoint
- Corruption occurring.

---

**CBR20005E KEYPOINT CTKE CANNOT BE FILED – MPIF RESTART ABORTED**

**Explanation:** While trying to rebuild data in keypoint E, CBR2 was unable to file the updated keypoint (error returned from the CYYB segment). Multi-Processor Interconnect Facility (MPIF) data used by CTIN on the next initial program load (IPL) may not be correct.

**System Action:** MPIF restart is aborted. The TPF system continues to 1052 state.

**User Response:** Have your system programmer determine the cause of the error and correct it using the 00156 system error dump. MPIF data in keypoint E may need to be reinitialized by using MPIF commands.

The recovery may have been necessary because of:

- A keypoint being loaded from the general file
- An IPL occurring that used old copies of the keypoint

- Corruption occurring.

---

**CBR20006A MPIF DATA IN KEYPOINT E CANNOT BE VALIDATED SPECIFY OPTION: TO REPLACE MPIF DATA IN CTKE — ENTER: ZMPIF KPE REP IPL TO REBUILD MPIF CONTROL TABLES TO BYPASS THE REPLACE: ZMPIF KPE BYPASS**

**Explanation:** The Multi-Processor Interconnect Facility (MPIF) data in keypoint CTKE (CK6KE) is earlier than the data contained in path definition record (PDR) ordinal 1, and the slot for this processor ID.

This indicates the following:

- Keypoint CTKE was loaded from the loader general file (LGF)
- The TPF system performed an initial program load (IPL) from an old keypoint
- A ZMPIF SET SYSTEM or ZMPIF SET COMPLEX command failed to update both records
- Record destruction occurred.

**System Action:** Restart is suspended pending the operator response. The System Action for the Explanation is discussed with the Explanations.

**User Response:** To replace the MPIF data in CTKE with data in the PDR, respond by entering the ZMPIF KPE REP command. The TPF system then continues through restart to 1052 state but must be re-IPLed to have the new MPIF data in CTKA used to rebuild the MPIF tables.

To continue to 1052 state without replacing CTKE, respond by entering the ZMPIF KPE BYPASS command.

**Note:** If the data CTKE is not replaced or corrected by using the MPIF commands, this request message is repeated on each IPL of the TPF system.

See *TPF Operations* for more information about the ZMPIF KPE command.

---

**CBT10001I MPIF PATH STARTUP FAILED — *reason* MRBFUNC= *function* RSDA — *yyyy* WSDA — *zzzz***

**Where:**

*reason*
One of the reason texts listed in the explanation that follows.

*function*
The MRB function.

*yyyy*
The RSDA.

*zzzz*
The WSDA.

**Explanation:** The following reason text can be given:

**RESOURCE SHORTAGE**
An interconnect system decided not to establish communication based on local resource shortages.

**BUFFER SIZE ERROR**
The buffer sizes used for input/output (I/O) by this Multi-Processor Interconnect Facility (MPIF) are not compatible with the buffer sizes used by the TPF system at the other end of the path.

**T1/2/3 NOT RECEIVED**
A path startup message was received and should have been type 1, 2, or 3, but was not.

**INCORRECT VERSION**
The interface version received from the other side of the path during path start-up is not supported by this side.

**DEFINITION ERROR**
An interconnect system is trying to establish a path for which the receiving TPF system has no path defined for a given path class.

**NO PATH DEFINED**
All paths are currently in use (or not available for use) when a path start sequence was received.

**UNDEFINED PATH CLASS**
A startup sequence was received requesting an undefined class.

**UNSUPPORTED OPTIONS**
Options such as blocking and send list format are not supported by an interconnect host processor.

**MPIFC/MSPIC FAILURE**
Cross system sends are being rejected by the control program.

**System Action:** The path is ended with a halt device to the read and write sides of the path.

**User Response:** Do one of the following:

- Correct any definitional problems associated with the path
- See your system programmer for more information.

---

**CBT10002W MPIF BROADCAST EXCEEDS 4K BLOCK**

**Explanation:** During cross system startup, the number of Multi-Processor Interconnect Facility (MPIF) users to be sent to another TPF system exceeds the 4K interface requirement to CBB0.

**System Action:** The first 520 MPIF user names are sent.

**User Response:** None.

---

**CBT10003I MPIF PATH *path* ESTABLISHED TO SYSTEM — *sys* CLASS — *cl* VIA — *dev* RSDA — *sda* WSDA — *sda***

**Where:**

*path*
The Multi-Processor Interconnect Facility (MPIF) path.

*sys* The TPF system name.

*cl* The class.

*dev* The generic device name.

*sda* The symbolic device address (SDA)

**Explanation:** The Multi-Processor Interconnect Facility (MPIF) path referenced in the message permits communication with the TPF system named in the message.

**System Action:** The specified path can now be used for connections. MPIF users waiting for path activation to the TPF system are notified through the MPIFC QUERY user exits.

**User Response:** None.

---

**CBT10004W MPIF BROADCAST FAILED TO SYSTEM** *sys*

**Explanation:** The update of the broadcast sequence number to TPF system named in the message failed.

**System Action:** Processing is continued.

**User Response:** None.

---

**CBT10005E MPIF STARTUP SEND FAILED ON PATH** *path* **RC—***retcode*

**Where:**

*path*
The path name.

*retcode*
The return code.

**Explanation:** A MPIFC SEND macro produced a return code of *retcode* during path startup processing for the path.

**System Action:** The path is stopped if it is not already stopping.

**User Response:** Review the console for other error messages associated with the path and take action on these messages.

---

**CBY00040E MISMATCH BETWEEN THE NUMBER OF CCWAS GENED VIA CTKE AND MPIF HARDWARE DEFINITION RECORD — MPIF RESTART EXITED**

**Explanation:** There are not enough CCWA areas allocated by CTIN (based on CTKE) for the number of CTC links defined in Multi-Processor Interconnect Facility (MPIF) Hardware Definition record (HDW), #HDREC.

**System Action:** MPIF restart exits.

**User Response:** Have your system programmer resolve any differences between CTKE and the MPIF HDW.

---

**CBY00050E MPIF HARDWARE DEFINITION RECORD FIND ERROR**

**Explanation:** The program was not able to obtain a #HDREC record through the FIWHC macro.

**System Action:** Multi-Processor Interconnect Facility (MPIF) restart exits.

**User Response:** Have your system programmer determine the cause of the error and correct it.

---

**CBY00060E MPIF HARDWARE DEFINITION RECORD FACE ERROR. MPIF RESTART EXITED**

**Explanation:** An error condition was returned from FACS when attempting to access a #HDREC record.

**System Action:** Multi-Processor Interconnect Facility (MPIF) restart exits.

**User Response:** Have your system programmer to ensure that the ordinal number and the file address compute program (FACE) ID are correct.

---

**CBY10002W MPIF DEVICE — *dev* — DISCONNECTED ON RANGE — *sda-sda***

**Where:**

*dev* The Multi-Processor Interconnect Facility (MPIF) device name.

*sda* The symbolic device address (SDA).

**Explanation:** The device name referenced in the message has no prime paths on the range indicated.

**System Action:** None.

**User Response:** Attach the range to the TPF system, if needed.

---

**CBY10003I MPIF DEVICE — *dev* — TURNED OFF FOR RANGE — *sda-sda***

**Where:**

*dev* The Multi-Processor Interconnect Facility (MPIF) device name.

*sda* The symbolic device address (SDA).

**Explanation:** The specified device (*dev*) is turned off.

**System Action:** None.

**User Response:** None.

---

**CBY10004A INTERCONNECT PRIMING ERROR. NO RANGES PRIMED**

**Explanation:** No paths were primed using the Multi-Processor Interconnect Facility (MPIF) device.

**System Action:** None.

**User Response:** Have system programmer must use the other messages generated by the MPIF restart process to determine the cause of the error and correct it.

---

**CBY10005W CIOSC MOUNT ERROR — UNDEFINED SDA(S):** *sda sda ...*

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** The symbolic device addresses (SDAs) indicated are not in the IOCP generation.

**System Action:** None.

**User Response:** Have your system programmer must add the indicated addresses to the input/output configuration program (IOCP) generation.

---

**CBY10006I SDA(S) UNAVAILABLE to MPIF:** *sda sda ...*

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** The symbolic device addresses (SDAs)

referenced in the message were not defined for Multi-Processor Interconnect Facility (MPIF) and SNA channel-to-channel (CTC) support. The TPF system gives SNA precedence when a conflicting definition exists. MPIF does not process any input/output (I/O) operations for these SDAs.

**System Action:** None.

**User Response:** None.

---

**CBY10050E LOST INTERRUPT FOR MPIF I/O DURING PRIMING ON SDA** *sda*

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** An interrupt was not received from the indicated symbolic device address (SDA) in a timely manner.

**System Action:** The future interrupt for this SDA is ignored.

**User Response:** Check the hardware.

---

**CBY30002W MPIF MTOM PATH** *path* **NOT ESTABLISHED**

**Where:**

*path*
The memory-to-memory (MTOM) path name.

**Explanation:** The MTOM path name referenced in the message was not made operational because the path destination TPF system name is not the same as the local TPF system name.

**System Action:** None.

**User Response:** The path should be displayed and redefined with the correct TPF system name.

---

**CBY30003I MPIF PATH** *path* **ESTABLISHED TO SYSTEM —** *sys* **CLASS —** *cl* **VIA — MTOM RSDA —** *sda* **WSDA —** *sda*

**Where:**

*path*
The memory-to-memory (MTOM) path name.

*sys* The TPF system name.

*cl* The class of path.

*sda* The symbolic device address (SDA).

**Explanation:** The MTOM path referenced in the message is operational and communication through the path was established. The generic device name, class of path and SDAs are also referenced in the message.

**System Action:** The specified path can now be used for connections. Multi-Processor Interconnect Facility (MPIF) users waiting for path activation to the TPF system are notified through the MPIFC QUERY user exits.

**User Response:** None.

---

**CCEB0001E STATIC CTL BLK CORRUPTED, REFERENCE PRIOR DUMPS**

**Explanation:** During ISO-C cleanup processing, a field in the static control block was corrupted, which resulted in a system error. After processing the system error, the TPF system returns to ISO-C cleanup processing. To prevent a recurring dump loop, this message is issued and static control block cleanup processing is bypassed.

**System Action:** The corrupted static control block field is ignored and ISO-C cleanup processing continues.

**User Response:** Do the following:

1. Examine the system error dump to determine why the corruption in the static control block occurred.
2. Correct the problem.

---

**CCIM0003I THE LINK TO CTC NAME** *ctcname* **ON CTC SDA** *sda* **IS NOW INACTIVE.**

**Where:**

*ctcname*
The SNA channel-to-channel (CTC) device name.

*sda* The CTC symbolic device address (SDA).

**Explanation:** This message indicates that the TPF system received an attention interrupt from the CTC. This can occur when a CTC connection is inactivated by the IBM Virtual Telecommunications Access Method (VTAM) or another TPF system. This is a normal condition during the inactivation.

**System Action:** The TPF system resets the control blocks associated with the CTC control unit. The control blocks associated with all of the logical units (LUs) that had a session through this CTC are also reset.

**User Response:** For normal inactivation, no action is necessary. Otherwise, check why the link was inactivated.

---

**CCIM0020A AN ASYNCHRONOUS INTERRUPT WAS RECEIVED ON 37X5 SDA** *sda***. ISSUE A 'ZNETW ACT' MESSAGE.**

**Where:**

*sda* The 37X5 symbolic device address (SDA).

**Explanation:** This message may be issued for the following reasons:

- An asynchronous device end without unit check is received by the TPF system If the Network Control Program (NCP) is not active in the TPF system, then this is a signal to the TPF system that the NCP completed an IPL.
- An asynchronous device end with a unit check is received by the TPF system For PU 5 NPCs, this message signals to the TPF system that the NCP was not active when this interrupt was received. This can happen on a dual engine 3745 when one channel control unit (CCU) or NCP fails, and all sessions through that NCP are ended. When a switch occurs, the surviving CCU presents this status.

**System Action:** When a device end with unit check is received and the NCP is active, TPF NCP control blocks are reset and all the sessions through the NCP are ended.

**User Response:** When an asynchronous device end without unit check is received for an inactive NCP, you can enter the

ZNETW ACT command to activate the NCP or to begin PU5 communication.

If the NCP is active and this message is received, it indicates an error condition. Correct the error condition and reactivate the TPF-to-NCP connection.

---

**CCIM0071E AN ERROR OCCURRED DURING I/O OPERATION *op* ON 37X5 SDA *sda*. THE CSW IS *statusword* [AND THE SENSE DATA IS *sense*].**

**Where:**

*op* CCW operation code of the attempted input/output (I/O) operation.

*sda* The 37X5 symbolic device address (SDA).

*statusword*
The subchannel status word beginning with the CCW address.

*sense*
The sense data associated with the error.

**Explanation:** This message occurs for one of the following reasons:

- The input/output (I/O) operation indicated by the CCW operation code did not complete successfully.
- If the displayed operation is 00, an asynchronous error interrupt occurred.

The sense data, if displayed, indicates the type of error. If the sense data is not displayed, the displayed channel status word (CSW) device and subchannel status bytes indicate the type of error.

**System Action:** The TPF system resets the control blocks associated with the Network Control Program (NCP) to their original state. The control blocks associated with all of the logical units (LUs) that had a session through this NCP are also reset.

**User Response:** Review the sense data, if present, and the CSW to determine the type of error.

See *System/370 Reference Summary* for more information.

---

**CCIM0072E AN ERROR OCCURRED DURING CONTROL OPERATION *op* ON 37X5 SDA *sda*. THE CSW IS *statusword* [AND THE SENSE DATA IS *sense*].**

**Where:**

*op* The CCW operation code of the attempted input/output (I/O) operation.

*sda* The 37X5 symbolic device address.

*statusword*
The subchannel status word beginning with the CCW address.

*sense*
The sense data associated with the error.

**Explanation:** One of the following channel commands received an error during an input/output (I/O) operation with a 37X5 communications controller:

- X'03' — No Op
- X'0D' — Break
- X'93' — Restart/Reset
- X'42' — Read Clear

The sense data, if present, indicates the type of error. Otherwise, the channel status word (CSW) device and subchannel status bytes indicate the type of error.

**System Action:** The TPF system resets all of the control blocks associated with the Network Control Program (NCP) or the emulator program (EP) that is associated with the 37X5 communications controller.

**User Response:** Review the sense data, if present, and the CSW to determine the type of error.

See *System/370 Reference Summary* for more information.

---

**CCIM0075E AN ERROR OCCURRED DURING IPL OPERATION *op* ON 3705 SDA *sda*. THE CSW IS *statusword* [AND THE SENSE DATA IS *sense*].**

**Where:**

*op* The CCW operation code of the attempted IPL operation.

*sda* The 3705 symbolic device address.

*statusword*
The subchannel status word beginning with the CCW address.

*sense*
The sense data associated with the error.

**Explanation:** This message occurs because the IPL operation indicated by the CCW operation code did not complete successfully. The sense data, if displayed, indicates the type of error. If the sense data is not displayed, the displayed channel status word (CSW) device and subchannel status bytes indicate the type of error.

**System Action:** The TPF system resets the control blocks associated with the Network Control Program (NCP) to their original state. The control blocks associated with all of the logical units (LUs) that had a session through this NCP are also reset.

**User Response:** Review the sense data, if present, and the CSW to determine the type of error.

See *System/370 Reference Summary* for more information.

---

**CCIM0076E TPF CODE REQUESTED INVALID INTERNAL MESSAGE NUMBER *nnn* DURING OPERATION *op* ON 37X5/CTC *sda*. THE CSW IS *statusword* [AND THE SENSE DATA IS *sense*].**

**Where:**

*nnn*
The internal TPF message number.

*op* The CCW operation code of the attempted input/output (I/O) operation.

*sda* The 37X5 or CTC symbolic device address (SDA).

*statusword*
The subchannel status word beginning with the CCW address.

*sense*
The sense data associated with the error.

**Explanation:** An input/output (I/O) error occurred, and due to a software error, an internal message number that was not valid was requested when a CXFRC was issued from CCSNA1 or CC3705 to CCIM (the 37X5/CTC error message segment).

**System Action:** The TPF NCP or CTC (or 3705 emulator program (EP)) control blocks are reset along with the control blocks of all the logical units (LUs) that had a session through this NCP or CTC.

**User Response:** Do one of the following:

- The internal message number that is not valid occurred as a result of a TPF software error. Have your system programmer determine the place in CCSNA1 or CC3705 that issues this internal message.
- See your IBM service representative.
- The sense data, if present, indicates the type of input/output (I/O) error that occurred with the 37X5 or CTC. The device and subchannel status bytes of the channel status work (CSW) also help when determining the problem with the 37X5 or CTC device. Correct the problem and reactivate the 37X5 or CTC.

See *System/370 Reference Summary* for more information.

---

**CCIM0077E A PERMANENT LOST INTERRUPT OCCURRED DURING OPERATION *op* ON 37X5/CTC *sda*.**

**Where:**

*op* The CCW operation code of the attempted input/output (I/O) operation.

*sda* The 37X5 or CTC symbolic device address (SDA).

**Explanation:** The TPF system is not communicating with the CTC control unit or the 37X5 communications controller. Possible reasons for the loss of communications in a Network Control Program (NCP) are:

- The NCP is expecting a read start command of X'52' and due to a software error, the TPF system is sending a read start of X'32'.
- The NCP is expecting a write start command of X'31', and due to a software error, the TPF system is sending a write start of X'51'.

  The NCP throws away the data that was sent and waits for the correct read or write start command.

  For a CTC, the possible cause might be one of the TPF system on a TPF-to-TPF CTC connection is not up. One of the TPF systems might be issuing a dump or its input list is shut down.

  For an NCP, the TPF system issues the CCIM0078W message after the first occurrence of a lost interrupt and then tries the operation again. If the problem occurs again, the CCIM0077E message is issued.

**System Action:** The TPF system resets the control blocks associated with the CTC or 37X5 communication controller. The control blocks associated with all of the logical units (LUs) that had a session through this NCP or CTC are also reset.

**User Response:** For an NCP, check the status of the 37X5. If there is no hardware error, have your system programmer determine the cause of the error and correct it.

For a CTC connection, check the status of the connection, as well as the TPF system at the other end. Correct the problem before activating the CTC connection again.

---

**CCIM0078W A LOST INTERRUPT OCCURRED DURING OPERATION *op* ON 37X5 *sda*. THE OPERATION WILL BE TRIED AGAIN.**

**Where:**

*op* The CCW operation code of the attempted input/output (I/O) operation.

*sda* The 37X5 symbolic device address (SDA).

**Explanation:** The TPF system issues this message when an interrupt is not received within 5 seconds during any attempt to perform an input/output (I/O) operation with a 37X5 communication controller.

**System Action:** The TPF system tries the operation again. If the lost interrupt condition occurs again, the CCIM0077E message is issued.

**User Response:** If the CCIM0077E message is issued, refer to its description for the appropriate action. If the CCIM0077E message is not issued, the problem was temporary and can be ignored.

---

**CCIM0079E INTERRUPT IS LOST DURING OPERATION *op* ON CTC *sda* DUE TO UNSUPPORTED COMMAND ON THE OTHER SIDE**

**Where:**

*op* The CCW operation code of the attempted input/output (I/O) operation.

*sda* The channel-to-channel (CTC) symbolic device address (SDA).

**Explanation:** The TPF system did not receive the interrupt from the CTC control unit for the CCW it issued because the other side of the CTC channel adapter has a channel command that is not supported by CTC.

A possible cause is that CTC uses the SDA on one side of the CTC channel adapter in a TPF-to-TPF CTC connection while Multi-Processor Interconnect Facility (MPIF) uses the SDA on the other side. MPIF issues a CTL command of X'07' that completes when the CTC side issues a sense command byte (SCB). The SCB command is chained with read commands. After the CTL command on the MPIF side is completed, no write command issued on the MPIF side satisfies the read command on the CTC side. Therefore, the interrupt for the CTC CCW chain is lost.

**System Action:** the TPF system resets the control blocks associated with the CTC communication controller. The PSEUDO CCW area used by the CTC CCW chain is cleared. CTC XID processing ends without trying again.

**User Response:** Check the configuration for the CTC communication controller to make sure that the SDAs on each end of the CTC channel adapter are one of the following:

- Both define in keypoint record (CTK2) so that they are used by CTC
- Not defined in CTK2, in which case they are used by MPIF.

---

**CCIM0080E AN ERROR OCCURRED DURING I/O OPERATION *op* ON CTC SDA *sda*. THE CSW IS *statusword* [AND THE SENSE DATA IS *sense*].**

**Where:**

*op* The CCW operation code of the attempted input/output (I/O) operation.

*sda* The channel-to-channel (CTC) symbolic device address (SDA).

*statusword*
The subchannel status word beginning with the CCW address.

*sense*
The sense data associated with the error.

**Explanation:** This message occurs for one of the following reasons:

- The input/output (I/O) operation indicated by the CCW operation code did not complete successfully.
- If the displayed operation is 00, an asynchronous error interrupt occurred.

The sense data, if displayed, indicates the type of error. If the sense data is not displayed, the displayed channel status word (CSW) device and subchannel status bytes indicate the type of error.

**System Action:** The TPF system resets the control blocks associated with the CTC to their original state. The control blocks associated with all of the logical units (LUs) that had a session through this CTC are also reset.

**User Response:** Review the sense data, if present, and the CSW to determine the type of error.

See *System/370 Reference Summary* for more information. See *ESA/390 ESCON Channel-to-Channel Adapter* for detailed information and the appropriate action to take.

---

**CCIM0081W A CHANNEL ERROR OCCURRED DURING OPERATION *op* ON 37X5 *sda*. THE CSW IS *statusword*. THE OPERATION WILL BE TRIED AGAIN.**

**Where:**

*op* The CCW operation code of the attempted input/output (I/O) operation.

*sda* The 37X5 symbolic device address (SDA).

*statusword*
The subchannel status word beginning with the CCW address.

**Explanation:** This message occurs because a channel hardware error occurred during an input/output (I/O) operation with a 37X5 communications controller. Possible channel errors are:

- Interface-control check
- Channel-control check
- Channel-data check.

**System Action:** The TPF system tries the operation 15 times for a channel-data check, and 3 times for interface-control or channel-control checks.

If the problems persist, the TPF system issues the CCIM0087E message.

**User Response:** If this error occurs only one time, no action is necessary. However, if the TPF system issues the CCIM0087E message, this indicates a hardware problem. In this case you should see your IBM service representative.

See *System/370 Reference Summary* to determine the type of channel error from the CSW.

---

**CCIM0083E A CHANNEL ERROR OCCURRED DURING OPERATION *op* ON CTC *sda* THE CSW IS *statusword***

**Where:**

*op* The CCW operation code of the attempted input/output (I/O) operation.

*sda* The channel-to-channel (CTC) symbolic device address (SDA).

*statusword*
The subchannel status word beginning with the CCW address.

**Explanation:** This message occurs because a channel program error occurred during an input/output (I/O) operation with a CTC control unit. If the displayed operation is 00, an asynchronous channel error occurred.

**Note:** When the displayed operation is not 00, the channel program error is a software error.

The channel status word (CSW) indicates the type of error and the CSW CCW address points to the end of the last CCW processed in the channel program.

Possible software channel program errors are:
- Program check
- Protection check
- Chaining check.

Possible channel hardware errors are:
- Channel data check
- Channel control check
- Interface control check.

**System Action:** The TPF system resets the control blocks associated with the CTC control unit. The control blocks associated with all of the logical units (LUs) that had a session through this CTC are also reset.

**User Response:** For a channel program error, have your system programmer determine the cause of the error and correct it. Have your system programmer display and review the CCWs.

If the error is a channel hardware error, see your IBM service representative.

See *System/370 Reference Summary* to determine the type of channel error from the CSW.

**CCIM0086E 37X5/CTC SDA *sda* WAS FOUND INOPERATIVE (CONDITION CODE 03) DURING OPERATION *op*. INTERVENTION IS REQUIRED.**

**Where:**

*sda* The 37X5 or the channel-to-channel (CTC) symbolic device address (SDA).

*op* The CCW operation code of the attempted input/output (I/O) operation.

**Explanation:** A deferred condition code 3 or an immediate condition code 3 occurred during an input/output (I/O) operation with a CTC or 37X5 communications controller. This message indicates a hardware error.

**System Action:** The TPF system resets the control blocks associated with the CTC or 37X5 communications controller. The control blocks associated with all of the logical units (LUs) in session through this device are also reset.

**User Response:** Check the status of the device. If the problem cannot be immediately corrected, see your IBM service representative.

When the problem is corrected, bring the device online and reactivate it.

---

**CCIM0087E AN UNRECOVERABLE ERROR OCCURRED DURING OPERATION *op* ON 37X5/CTC SDA *sda* THE CSW IS *statusword*. INTERVENTION IS REQUIRED.**

**Where:**

*op* CCW operation code of the attempted input/output (I/O) operation.

*sda* 37X5 or channel-to-channel (CTC) symbolic device address (SDA).

*statusword*
The subchannel status word beginning with the CCW address.

**Explanation:** For CTC, an unrecoverable error occurred during an input/output (I/O) operation with this CTC device. The CSW device and subchannel status bytes indicate the type of error.

For the Network Control Program (NCP), an unrecoverable error occurred during an I/O operation with a 37X5 device. The channel program was retried several times. Example of unrecoverable errors are channel errors such as:
- Channel data check
- Channel control check
- Interface control check.

For CTC or NCP, possible channel hardware errors are:
- Channel data check
- Channel control check
- Interface control check.

**System Action:** For CTC, the TPF system resets the control blocks associated with the CTC, as well as the control blocks associated with the logical units (LUs) that had a session through this CTC.

For NCP, TPF system resets the control blocks associated with the NCP, as well as the control blocks associated with the LUs that had a session through this NCP.

**User Response:** Review the CSW to determine the type of error. If the error is a channel hardware error, see your IBM service representative.

See *System/370 Reference Summary* and *370/XA Principles of Operation* for more detailed information about the CSW.

---

**CCIM0088W AUTO NETWORK SHUTDOWN OCCURRED AFTER OPERATION *op* ON 37X5 SDA *sda* THE CSW IS *statusword* [AND THE SENSE DATA IS *sense*].**

**Where:**

*op* CCW operation code of the attempted input/output (I/O) operation.

*sda* The 37X5 symbolic device address (SDA).

*statusword*
The subchannel status word beginning with the CCW address.

*sense*
The sense data associated with the error.

**Explanation:** This message occurs due to one of the following reasons:
- The Network Control Program (NCP) issued an ABORT sense during the operation indicated by the operations code (op code)
- If the displayed operation is 00, an asynchronous unit check occurred with an ABORT sense.

**System Action:** The TPF system resets the control blocks associated with the NCP, as well as the control blocks associated with the logical units (LUs) that had a session through this NCP.

**User Response:** Review the sense data and the CSW to determine the type of error.

See *System/370 Reference Summary* for more information about the sense data and the appropriate action to take.

---

**CCIM0089E THE LINK TO NETID *netid* ALS NAME *alsname* ON 37X5 SDA *sda* IS NOW INACTIVE.**

**Where:**

*netid*
The network identifier of the failing link.

*alsname*
The adjacent link station (ALS) name.

*sda* The 37X5 symbolic device address (SDA).

**Explanation:** An ABORT sense was received from the adjacent link station (ALS).

When an ALS is inactivated by IBM Virtual Telecommunications Access Method (VTAM), the TPF system receives a notification from VTAM of UNIT CHECK with ABORT status, which is Sense 01. This is a normal condition during the inactivation.

**System Action:** The TPF ALS control blocks are reset along with the control blocks of all the logical units (LUs) that had a

session through this Network Control Program (NCP).

**User Response:** For an unexpected inactivation, check the status of the NCP from VTAM. Correct the problem, and then reactivate the TPF-to-NCP connection. However, for normal inactivation of the link, no action is necessary.

See the appropriate IBM Virtual Telecommunications Access Method (VTAM) publications for more information.

---

**CCIM0090E RESTART SENSE COULD NOT BE INITIATED TO CTC SDA *sda* DUE TO BUFFER ALLOCATION ERROR**

**Where:**

*sda* The channel-to-channel (CTC) symbolic device address (SDA).

**Explanation:** During SNA restart and after a software IPL, a sense is initiated to each active CTC link to determine whether the link is still active. In order to initiate the sense, a write buffer area and two read buffer areas must be allocated. Insufficient 4K pages were available from the SNA buffer pool for the allocation of all the required 2K buffers.

**System Action:** The TPF system returns any acquired pages to the SNA buffer pool.

**User Response:** Check the shortage of 4 K pages in the SNA buffer pool. If necessary, have your system programmer determine the cause of the error and correct it.

---

**CCIM0091W AUTO NETWORK SHUTDOWN OCCURRED ON SDA *sda* DUE TO VR BLOCKED TIME-OUT.**

**Where:**

*sda* The 37X5 symbolic device address (SDA) or the channel-to-channel (CTC) SDA.

**Explanation:** An ANS was issued to the NCP/CTC (ALS) when a VR blocked time-out occurred.

**System Action:** The TPF system resets the control blocks associated with the NCP/CTC, as well as the control blocks associated with the logical units (LUs) that had a session through this NCP/CTC.

**User Response:** Check the VR between the TPF system and NCP/CTC as to why the VR block took place and hit the time out.

See *TPF ACF/SNA Data Communications Reference* for more information about network flow control.

---

**CCIM0092W AUTO NETWORK SHUTDOWN OCCURRED ON SDA *sda* DUE TO SLOWDOWN TIME-OUT**

**Where:**

*sda* The 37X5 symbolic device address (SDA).

**Explanation:** An SNA link was in slowdown for a period of time that exceeded the time-out limit specified by the SLOWTIME parameter in the SNAKEY macro in keypoint record 2 (CTK2).

**System Action:** The TPF system breaks this link connection.

**User Response:** Do the following:

1. Check the communications controller to determine why it was in slowdown for an extended period of time.
2. Increase the value of the SLOWTIME parameter by entering the ZNKEY command, if necessary.

See *TPF ACF/SNA Data Communications Reference* for more information about network flow control.

See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

See *TPF Operations* for more information about the ZNKEY command.

---

**CCIM0093W AUTO NETWORK SHUTDOWN OCCURRED ON SDA *sda* DUE TO INPUT LIST SHUTDOWN AND NCP SLOWDOWN**

**Where:**

*sda* The 37X5 symbolic device address (SDA).

**Explanation:** An NCP/CTC link had a virtual route (VR) block condition and the TPF system was in input list shutdown for a period of time that exceeded the time-out limit specified by the VRILTO parameter for this link.

**System Action:** The TPF system breaks this NCP or CTC link connection.

**User Response:** Do the following:

1. Check the NCP or CTC to determine why the VR was blocked.
2. Check the TPF system to determine what caused the input list shutdown condition.
3. Increase the value of the VRILTO parameter for this link, if necessary, on the offline ACF/SNA table generation (OSTG) NCP or CTC statement that defines this link.

See *TPF ACF/SNA Data Communications Reference* for more information about network flow control.

See *TPF ACF/SNA Network Generation* for more information about the OSTG process.

# CCTL – CDSI

---

**CCTL0001E**

**Explanation:** Refer to the CSIO line error messages for any message with a CTL header.

**System Action:** None.

**User Response:** None.

---

**CDBG0001W NOT ENOUGH STORAGE TO SATISFY REQUEST FROM *module*, DEBUGGER MAY ABEND**

**Where:**

*module*
The module that is making the storage request.

**Explanation:** Additional entry control block (ECB) heap storage was requested, but there was not any more storage available.

**System Action:** The debugger tries to continue, but will most likely fail.

**User Response:** Do the following:

1. Enter the ZCTKA ALTER command to increase the size of ECB heap storage.
2. Perform an initial program load (IPL) of the TPF system.
3. Run the ECB again.

See *TPF Operations* for more information about the ZCTKA ALTER command.

---

**CDBG0002E C RUN-TIME ENVIRONMENT FAILED TO INITIALIZE**

**Explanation:** A call to the C environment initialization routine returned with a nonzero return code during TPF C Debugger for VisualAge Client initialization.

**System Action:** The TPF C Debugger for VisualAge Client initialization ends and the entry control block (ECB) runs without the debugger.

**User Response:** Do the following:

1. Verify that the CDB2 segment is loaded to your TPF system or subsystem.
2. Correct the problem that caused the C environment initialization to fail.
3. Run the ECB again.

---

**CDBP0001E AN ERROR OCCURRED DURING DEBUG SETUP PROCESSING. ERROR ON** *socket_call* **API, RETURN CODE** *rtcode***.**

**Where:**

*socket_call*
The socket call that received an error return code.

*rtcode*
The return code to the socket call in decimal format.

**Explanation:** The ZDBUG command with the START parameter specified was entered to start the VisualAge TPF debug server, but the debug setup request processor found a Transmission Control Protocol/Internet Protocol (TCP/IP) error while processing a request from a client.

**System Action:** The debug request from the debug setup client program was not processed. The VisualAge TPF debug server continues to run.

**User Response:** Do the following:

1. Determine the cause of the TCP/IP IP error and correct it.
2. Enter **ZCLAW DISPLAY ALL** to ensure that a Common Link Access to Workstation (CLAW) connection is marked as active.
3. Ensure that the TPF system is in NORM state.

See *TPF Operations* for more information about the ZDBUG and ZCLAW DISPLAY commands.

---

**CDBP0002E VISUALAGE TPF DEBUG SERVER RECEIVED A REQUEST IT CANNOT PROCESS. BAD REQUEST LENGTH.**

**Explanation:** The debug setup request processor received a request that is smaller or larger than it can handle.

**System Action:** The VisualAge TPF debug server continues to run, but this debug setup request is discarded.

**User Response:** Ensure that the client is at a level that this VisualAge TPF debug server can process.

See the *TPF Migration Guide: Program Update Tapes* for more information about software requirements for the VisualAge TPF debug server.

---

**CDBP0003E VISUALAGE TPF DEBUG SERVER RECEIVED A REQUEST IT CANNOT PROCESS. UNKNOWN ACTION CODE.**

**Explanation:** The debug setup request processor received a request it could not handle because of an unknown action code.

**System Action:** The VisualAge TPF debug server continues to run, but this debug setup request is discarded.

**User Response:** Ensure that the client is at a level that this VisualAge TPF debug server can process.

See the *TPF Migration Guide: Program Update Tapes* for more information about software requirements for the VisualAge TPF debug server.

---

**CDBS0001I VISUALAGE TPF DEBUG SERVER STARTED FOR HOST:** *ipaddr* **(***wrkstname***) ON PORT** *port*

**Where:**

*ipaddr*
The Internet Protocol (IP) address of the VisualAge TPF debug server.

*wrkstname*
The workstation name of the VisualAge TPF debug server.

*port*
The port number, in decimal format, of the VisualAge TPF debug server.

**Explanation:** The ZDBUG command with the START parameter specified was entered to start the VisualAge TPF debug server. The VisualAge TPF debug server has started. You can now use the TPF debug registration client to identify programs to debug.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDBUG command.

---

**CDBS0002I VISUALAGE TPF DEBUG SERVER STARTED FOR HOST:** *ipaddr* **ON PORT** *port*

**Where:**

*ipaddr*
The Internet Protocol (IP) address of the VisualAge TPF debug server.

*port*
The port number, in decimal format, of the VisualAge TPF debug server.

**Explanation:** The ZDBUG command with the START parameter specified was entered to start the VisualAge TPF debug server. The VisualAge TPF debug server has started. You can now use the TPF debug registration client to identify programs to debug.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDBUG command.

**CDBS0003I VISUALAGE TPF DEBUG SERVER STOPPED. ONE CLIENT WAS ACTIVATED.**

**Explanation:** The VisualAge TPF debug server was stopped by doing one of the following:

- You cycled down the TPF system from NORM state to 1052 state.
- You deactivated one or more Common Link Access to Workstation (CLAW) workstations by entering the ZCLAW INACTIVATE command.
- You entered the ZDBUG command with the STOP parameter specified.

You can no longer use the TPF debug registration client to identify programs to debug.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW INACTIVATE and ZDBUG commands.

**CDBS0004I VISUALAGE TPF DEBUG SERVER STOPPED.** *clientnum* **CLIENTS WERE ACTIVATED.**

**Where:**

*clientnum*
The number of debug setup clients that made contact with the VisualAge TPF debug server.

**Explanation:** The VisualAge TPF debug server was stopped by doing one of the following:

- You cycled down the TPF system from NORM state to 1052 state.
- You deactivated one or more Common Link Access to Workstation (CLAW) workstations by entering the ZCLAW INACTIVATE command.
- You entered the ZDBUG command with the STOP parameter specified.

You can no longer use the TPF debug registration client to identify programs to debug.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about stopping the VisualAge TPF debug server.

**CDBS0005E VISUALAGE TPF DEBUG SERVER FAILED TO START. ERROR ON** *socket_call* **API, RETURN CODE** *rtcode***.**

**Where:**

*socket_call*
The socket call that received an error return code.

*rtcode*
The return code to the socket call in decimal format.

**Explanation:** The ZDBUG command with the START parameter specified was entered to start the VisualAge TPF debug server, but a Transmission Control Protocol/Internet Protocol (TCP/IP) error occurred. You cannot debug programs using the VisualAge TPF debug server at this time.

**System Action:** The VisualAge TPF debug server is not started.

**User Response:** Do the following:

1. Enter **ZCLAW DISPLAY ALL** to check that a Common Link Access to Workstation (CLAW) connection is marked as active.
2. Ensure that the TPF system is in NORM state.
3. Enter **ZDBUG START** to start the VisualAge TPF debug server.

See *TPF Operations* for more information about the ZDBUG andZCLAW DISPLAY commands.

**CDBS0006E VISUALAGE TPF DEBUG SERVER FAILED TO START. ERROR ON** *socket_call* **API, RETURN CODE** *rtcode*

**Where:**

*socket_call*
The socket call that received an error return code.

*rtcode*
The return code to the socket call in decimal format.

**Explanation:** A Transmission Control Protocol/Internet Protocol (TCP/IP) error occurred while the VisualAge TPF debug server tried to start the CDBP program.

**System Action:** The debug request from the debug setup client program was not processed. The VisualAge TPF debug server continues to run.

**User Response:** Do the following:

1. Determine the cause of the TCP/IP error and correct it.
2. Enter **ZCLAW DISPLAY ALL** to ensure that a Common Link Access to Workstation (CLAW) connection is marked as active.
3. Ensure that the TPF system is in NORM state.

See *TPF Operations* for more information about the ZDBUG and ZCLAW DISPLAY commands.

---

**CDBS0008E COULD NOT FIND A MATCH FOR IP ADDRESS ENTERED**

**Explanation:** The ZDBUG command was entered with the CLEAR and IP-*ipaddr* parameters specified to clear an Internet Protocol (IP) entry in the trace-by-program or trace-by-terminal table.

**System Action:** The entry is not cleared from the table.

**User Response:** Enter the ZDBUG command again and specify the correct IP address for the CLEAR IP-*ipaddr* parameter.

See *TPF Operations* for more information about the ZDBUG command.

---

**CDBS0009I ALL VISUALAGE TPF DEBUG TRACE ENTRIES HAVE BEEN REMOVED**

**Explanation:** The ZDBUG command with the CLEAR parameter specified was entered to clear all trace entries from the TPF debug registration client.

**System Action:** Processing is completed successfully with all trace entries removed from the tables.

**User Response:** To begin tracing your programs, use the TPF Debug Registration window to add debug trace entries.

See *TPF Operations* for more information about the ZDBUG command. See the *VisualAge TPF Online Help* for more information about the VisualAge TPF debug server, the TPF Debug Registration window, and how to add debug trace entries.

---

**CDBS0011I TPF DEBUG SERVER HAS BEEN DISABLED**

**Explanation:** The ZDBUG command was entered with the STOP parameter specified to stop the TPF debug server.

**System Action:** The TPF debug server is disabled.

**User Response:** None.

See *TPF Operations* for more information about the ZDBUG command.

---

**CDBS0012I TRACE ENTRY HAS BEEN REMOVED FOR:** *ipaddr*

**Where:**

*ipaddr*
The Internet Protocol (IP) address of the TPF debug server.

**Explanation:** The ZDBUG command was entered with the CLEAR and IP-*ipaddr* parameters specified to clear the trace entry.

**System Action:** Processing is completed successfully with a single trace entry removed from the table.

**User Response:** To begin tracing your programs, use the TPF Debug Registration window to add debug trace entries.

See *TPF Operations* for more information about the ZDBUG command.

---

**CDBS0013I START OF DEBUGGER REGISTRATION INFORMATION**

**Explanation:** The ZDBUG command was entered with the DISPLAY and ALL parameters specified to display all registration information.

**System Action:** Processing is completed successfully with registration information displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZDBUG command.

---

**CDBS0014I START OF DEBUGGER PROGRAM REGISTRATION INFORMATION**

**Explanation:** The ZDBUG command was entered with the DISPLAY and PROGRAM parameters specified to display program registration information.

**System Action:** Processing is completed successfully with program registration information displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZDBUG command.

---

**CDBS0015I START OF DEBUGGER TERMINAL REGISTRATION INFORMATION**

**Explanation:** The ZDBUG command was entered with the DISPLAY and TERMINAL parameters specified to display terminal registration information.

**System Action:** Processing is completed successfully with terminal registration information displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZDBUG command.

---

**CDBS0016I START OF DEBUGGER ACTIVE REGISTRATION INFORMATION**

**Explanation:** The ZDBUG command was entered with the DISPLAY and ACTIVE parameters specified to display information about active entries in the trace-by-program and trace-by-terminal tables.

**System Action:** Processing is completed successfully with registration information displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZDBUG command.

---

**CDBS0017I START OF DEBUGGER NONACTIVE REGISTRATION INFORMATION**

**Explanation:** The ZDBUG command with the DISPLAY and NONACTIVE parameters specified was entered to display information about entries in the trace-by-program and

trace-by-terminal tables that are not active.

**System Action:** Processing is completed successfully with registration information displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZDBUG command.

---

**CDBS0018W IP ADDRESS *ipaddr* CLEARED WHILE ENTRY WAS ACTIVE**

**Where:**

*ipaddr*
The Internet Protocol (IP) address of the TPF debug server.

**Explanation:** The ZDBUG command was entered with the CLEAR and IP-*ipaddr* parameters specified to clear an entry in the trace-by-program and trace-by-terminal tables when the entry was already active.

**System Action:** The trace entry is cleared.

**User Response:** None.

See *TPF Operations* for more information about the ZDBUG command.

---

**CDBS0019I AN ACTIVE TRACE ENTRY WAS FOUND. TPF DEBUGGER WAS NOT DISABLED. ALL NONACTIVE TRACE ENTRIES WERE REMOVED.**

**Explanation:** The ZDBUG command was entered with the CLEAR and IP-*ipaddr* parameters specified to clear an entry in the trace-by-program and trace-by-terminal tables when the entry was already active.

**System Action:** The debugger is not disabled because an active trace entry was found. However, all nonactive trace entries were removed.

**User Response:** None.

See *TPF Operations* for more information about the ZDBUG command.

---

**CDBS0020E VISUALAGE TPF DEBUG SERVER STOPPED. ERROR OCCURRED ON *socket_call* API, RETURN CODE *rtcode*.**

**Where:**

*socket_call*
The socket call that received an error return code.

*rtcode*
The return code to the socket call in decimal format.

**Explanation:** The ZDBUG command was entered with the START parameter specified to start the VisualAge TPF debug server, but a network error occurred.

**System Action:** The VisualAge TPF debug server is stopped.

**User Response:** Do the following:

1. See the `socket.h` header file for more information about the return code for the failing socket API.
2. Ensure that the TPF system is in NORM state.
3. Enter the ZDBUG command with the START parameter specified to start the VisualAge TPF debug server.

See *TPF Operations* for more information about the ZDBUG command.

---

**CDCO0002I RDB-*rdb* - CONTINUOUS DATA COLLECTION HAS BEEN STARTED**

**Where:**

*rdb* The remote relational database (RDB) that contains the continuous data collection (CDC) table.

**Explanation:** This is the normal response to the ZCDCO command with the START and RDB parameters specified.

**System Action:** CDC begins.

**User Response:** None.

See *TPF Operations* for more information about the ZCDCO command.

---

**CDCO0003I RDB-*rdb* - CONTINUOUS DATA COLLECTION HAS BEEN STOPPED**

**Where:**

*rdb* The remote relational database (RDB) that contains the continuous data collection (CDC) table.

**Explanation:** This is the normal response to the ZCDCO command with the STOP and RDB parameters specified.

**System Action:** CDC ends.

**User Response:** None.

See *TPF Operations* for more information about the ZCDCO command.

---

**CDCO0004W RDB-*rdb* - CONTINUOUS DATA COLLECTION ALREADY STOPPED**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** The ZCDCO command was entered with the STOP and RDB parameters specified; however, CDC is not running.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZCDCO command.

---

**CDCO0005W RDB-*rdb* - CONTINUOUS DATA COLLECTION ALREADY STARTED**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** The ZCDCO command was entered with the START and RDB parameters specified; however, CDC is already running.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZCDCO command.

---

**CDCO0006I RDB-*rdb* - CLEARED ALL CONTINUOUS DATA COLLECTION RECORDS FROM THE REMOTE DATABASE**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** This is the normal response to the ZCDCO command with the CLEAR and RDB parameters specified.

**System Action:** All CDC records are removed from the CDC table on the specified remote relational database.

**User Response:** None.

See *TPF Operations* for more information about the ZCDCO command.

---

**CDCO0007I RDB-*rdb* - CREATED CONTINUOUS DATA COLLECTION TABLE ON THE REMOTE DATABASE**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** This is the normal response to the ZCDCO command with the CREATE and RDB parameters specified.

**System Action:** The CDC table is created in the specified remote relational database and an entry is created in the list of remote relational databases.

**User Response:** None.

See *TPF Operations* for more information about the ZCDCO command.

---

**CDCO0008E RDB-*rdb* - INCORRECTLY SPECIFIED OR UNAVAILABLE REMOTE DATABASE WHILE ATTEMPTING TO CREATE A CONTINUOUS DATA COLLECTION TABLE**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** The ZCDCO command was entered with the CREATE and RDB parameters specified; however, the remote relational database is incorrect or unavailable.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Verify that the remote relational database is available and defined to the TPF Application Requester (TPFAR) feature.
   - If the database is not available, see your database administrator.
   - If the database is available but is not defined, enter the ZSQLD command to define the remote relational database.
2. Enter the ZCDCO command again and specify the CREATE parameter and a valid remote relational database for the RDB parameter.

See *TPF Operations* for more information about the ZCDCO and ZSQLD commands.

---

**CDCO0009E RDB-*rdb* - UNAVAILABLE REMOTE DATABASE WHILE ATTEMPTING TO CLEAR THE CONTINUOUS DATA COLLECTION TABLE**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** The ZCDCO command was entered with the CLEAR and RDB parameters specified; however, the specified remote relational database is unavailable.

**System Action:** The command is rejected and the entry is removed from the list of remote relational databases.

**User Response:** Do the following:

1. Verify that the remote relational database is available and defined to the TPF Application Requester (TPFAR) feature.
   - If the database is not available, see your database administrator.
   - If the database is available but is not defined, enter the ZSQLD command to define the remote relational database.
2. Enter the ZCDCO command again and specify the CLEAR parameter and a valid remote relational database for the RDB parameter.

See *TPF Operations* for more information about the ZCDCO and ZSQLD commands.

---

**CDCO0010E RDB-*rdb* - UNAVAILABLE TABLE WHILE ATTEMPTING TO CLEAR THE CONTINUOUS DATA COLLECTION TABLE**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** The ZCDCO command was entered with the CLEAR and RDB parameters specified; however, the CDC table in the specified remote relational database is unavailable.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Verify that the CDC table is defined or has an alias on the specified remote relational database by entering the ZCDCO command with the DISPLAY parameter specified.
2. Enter the ZCDCO command again and specify the CLEAR parameter and the correct remote relational database for the RDB parameter.

See *TPF Operations* for more information about the ZCDCO command.

---

**CDCO0011W RDB-*rdb* - UNABLE TO CREATE DATABASE - TOO MANY CONTINUOUS DATA COLLECTION DATABASES ON THE SYSTEM**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** The ZCDCO command was entered with the CREATE and RDB parameters specified; however, the maximum number of remote relational databases has already been created.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZCDCO command with the START and RDB parameters specified to use an existing remote relational database to store CDC records.
- Enter the ZCDCO command with the DELETE parameter specified to delete an unused entry and then reenter the ZCDCO command with the CREATE and RDB parameters specified.

See *TPF Operations* for more information about the ZCDCO command.

**CDCO0012I THE REMOTE DATABASE LIST HAS BEEN INITIALIZED**

**Explanation:** This is the normal response to the ZCDCO command with the INIT parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCDCO command.

**CDCO0013W RDB-*rdb* - TABLE ALREADY DEFINED ON REMOTE DATABASE - MARKING AS CREATED**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** The ZCDCO command was entered with the CREATE parameter specified; however, the remote relational database specified already has a CDC table.

**System Action:** The remote relational database is marked as having been created and is added to the remote relational database list.

**User Response:** None.

See *TPF Operations* for more information about the ZCDCO command.

**CDCO0014E RDB-*rdb* - INCORRECT VALUE FOR FREQ**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** The ZCDCO command was entered with the START, FREQ, and RDB parameters specified; however, the value for the FREQ parameter is incorrect.

**System Action:** The command is rejected.

**User Response:** Enter the ZCDCO command again and specify the START and RDB parameters and a valid value for the FREQ parameter.

See *TPF Operations* for more information about the ZCDCO command.

**CDCO0015E RDB-*rdb* - INCORRECT VALUE FOR TIME**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** The ZCDCO command was entered with the START, RDB, and TIME parameters specified; however, the value for the TIME parameter was incorrect.

**System Action:** The command is rejected.

**User Response:** Enter the ZCDCO command again and specify the START and RDB parameters and a valid value for the TIME parameter.

See *TPF Operations* for more information about the ZCDCO command.

**CDCO0016I DISPLAYING RUNNING CONTINUOUS DATA COLLECTORS**

**Explanation:** This is the normal response to the ZCDCO command with the DISPLAY and COLLECTORS parameters specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCDCO command.

**CDCO0017E RDB-*rdb* - UNAVAILABLE TABLE WHILE ATTEMPTING TO DELETE CONTINUOUS DATA COLLECTION TABLE**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** The ZCDCO command was entered with the DELETE and RDB parameters specified; however, the CDC table was not available.

**System Action:** The command is rejected and the entry is removed from the remote relational database list.

**User Response:** See your database administrator.

See *TPF Operations* for more information about the ZCDCO command.

**CDCO0018E RDB-*rdb* - UNAVAILABLE REMOTE DATABASE WHILE ATTEMPTING TO DELETE THE CONTINUOUS DATA COLLECTION TABLE**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** The ZCDCO command was entered with the DELETE and RDB parameters specified; however, the remote RDB specified is not available.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Verify that the remote relational database is available and defined to the TPF Application Requester (TPFAR) feature.
   - If the database is not available, see your database administrator.
   - If the database is available but is not defined, enter the ZSQLD command to define the remote relational database.
2. Enter the ZCDCO command again and specify the DELETE parameter and the correct remote relational database for the RDB parameter.

See *TPF Operations* for more information about the ZCDCO and ZSQLD commands.

**CDCO0019I RDB-*rdb* - CONTINUOUS DATA COLLECTION TABLE DELETED FROM THE REMOTE DATABASE**

**Where:**

*rdb* The remote relational database (RDB) that contains the continuous data collection (CDC) table.

**Explanation:** This is the normal response to the ZCDCO command with the DELETE and RDB parameters specified.

**System Action:** The specified CDC table is deleted from the remote relational database and the remote relational database list.

**User Response:** None.

See *TPF Operations* for more information about the ZCDCO command.

**CDCO0020I DISPLAYING CREATED CONTINUOUS DATA COLLECTION TABLES**

**Explanation:** This is the normal response to the ZCDCO command with the DISPLAY and DATABASES parameters specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCDCO command.

**CDCO0021E RDB-*rdb* - CONTINUOUS DATA COLLECTION TABLE MUST BE PREVIOUSLY DEFINED**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** The ZCDCO command was entered with the DELETE, CLEAR, or START parameter specified with the RDB parameter; however, the specified remote relational database that contains the CDC table was not defined previously to the TPF system.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZCDCO command with the DISPLAY parameter specified to verify that the remote RDB and CDC table names are correct.
2. Enter the ZCDCO command again and specify the CREATE parameter, using the correct remote RDB and CDC table parameters to define the table in the TPF system.

See *TPF Operations* for more information about the ZCDCO command.

**CDCO0022W RDB-*rdb* - UNAVAILABLE TABLE OR DATABASE WHILE ATTEMPTING TO WRITE CONTINUOUS DATA COLLECTION RECORDS - WILL TRY AGAIN AT NEXT COLLECTION INTERVAL**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** CDC is running but records cannot be written to the CDC table. If multiple errors occur within 60 seconds of each other, only the first error will be displayed.

**System Action:** None.

**User Response:** Do the following:

1. Verify that the remote relational database is available and defined to the TPF Application Requester (TPFAR) feature.
   - If the database is not available, see your database administrator.
   - If the database is available but is not defined, enter the ZSQLD command to define the remote relational database.
2. Enter the ZCDCO command with the DISPLAY parameter specified to verify that the CDC table and the remote relational database exist.

See *TPF Operations* for more information about the ZCDCO and ZSQLD commands.

**CDCO0023W RDB-*rdb* - CONTINUOUS DATA COLLECTION TABLE ALREADY CREATED ON THE REMOTE DATABASE**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** The ZCDCO command was entered with the CREATE parameter specified; however, the remote relational database specified has been created already.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZCDCO command.

---

**CDCO0024E RDB-*rdb* - SQL EXECUTION ERROR - SQLCODE- *sqlcode*, SQLSTATE- *sqlstate***

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

*sqlcode*
The signed integer value representing the disposition of the Structured Query language (SQL) statement.

*sqlstate*
The corresponding state to the signed integer value that represents the disposition of the SQL statement.

**Explanation:** The ZCDCO command was entered and encountered a problem running the SQL statement.

**System Action:** The command is rejected.

**User Response:** See your database administrator.

See *TPF Application Requester User's Guide* for more information about SQLCODES and SQLSTATES. See *TPF Operations* for more information about the ZCDCO command.

---

**CDCO0025E FILE COPY OF REMOTE DATABASE LIST NOT LOADED FOR CONTINUOUS DATA COLLECTION - FACS ERROR**

**Explanation:** The ZCDCO command was entered; however, a FACS error occurred during initialization of a continuous data collection (CDC) table.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Verify that IBMMP4 ordinal 18 is defined to FACS.
2. Enter the ZCDCO command again.

See *TPF Operations* for more information about the ZCDCO command. See *TPF System Generation* for more information about FACS.

---

**CDCO0026E REQUEST FAILED - UNABLE TO ATTACH SHARED MEMORY SEGMENT**

**Explanation:** The ZCDCO command was entered; however, storage allocation for a continuous data collection (CDC) table could not be completed.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Verify that the TPF system is in NORM state.
2. Enter the ZCDCO command again.

See *TPF Operations* for more information about the ZCDCO command.

---

**CDCO0028W UNEXPECTED VERSION CODE - CLEARING ALL ENTRIES FROM REMOTE DATABASE LIST**

**Explanation:** The ZCDCO command was entered, but an incorrect version of the remote relational database list was found.

**System Action:** The remote relational database list is reinitialized to match the correct version.

**User Response:** Enter the ZCDCO command again and specify the CREATE parameter to create all defined remote relational databases for continuous data collection (CDC).

See *TPF Operations* for more information about the ZCDCO command.

---

**CDCO0029E UNEXPECTED VERSION CODE - COLLECTOR ENDING ABNORMALLY**

**Explanation:** Continuous data collection (CDC) was running when an incorrect version of the remote relational database list was found.

**System Action:** The continuous data collector stopped.

**User Response:** Enter the ZCDCO command again and specify the START parameter to start CDC.

See *TPF Operations* for more information about the ZCDCO command.

---

**CDCO0030I RDB-*rdb* - CONTINUOUS DATA COLLECTION COMPLETED**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** Continuous data collection (CDC) reached the end of the processing time that had been set previously with the ZCDCO command with the START, TIME, and RDB parameters specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCDCO command.

---

**CDCO0031E RDB-*rdb* - CONTINUOUS DATA COLLECTION TABLE CANNOT BE DELETED WHILE ACTIVE**

**Where:**

*rdb* The remote relational database that contains the continuous data collection (CDC) table.

**Explanation:** The ZCDCO command was entered with the DELETE and RDB parameters specified; however, the CDC table cannot be deleted because a collector was active.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZCDCO command with the STOP and RDB parameters specified to stop the collector.
2. Enter the ZCDCO command with the DELETE and RDB parameters specified to delete the CDC table.

See *TPF Operations* for more information about the ZCDCO command.

---

**CDCO0032I RDB-*rdb* - CONTINUOUS DATA COLLECTION TABLE MIGRATED SUCCESSFULLY**

**Where:**

*rdb* The remote relational database (RDB) that contains the continuous data collection (CDC) table.

**Explanation:** This is the normal response to the ZCDCO command with the MIGRATE parameter specified.

**System Action:** The SYSTPF.TPF_DATA table on the specified remote RDB is migrated to the current level required by CDC.

**User Response:** None.

See *TPF Operations* for more information about the ZCDCO command.

---

**CDCO0033E RDB-*rdb* - CONTINUOUS DATA COLLECTION TABLE ALREADY MIGRATED**

**Where:**

*rdb* The remote relational database (RDB) that contains the continuous data collection (CDC) table.

**Explanation:** The ZCDCO command was entered with the MIGRATE parameter specified, but the SYSTPF.TPF_DATA table on the specified remote RDB is already migrated to the current level required by CDC.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZCDCO command.

---

**CDFT0001E INVALID INPUT INPUT FORMAT: ZDFCT *nnnnn* (1–5 DECIMAL CHARACTERS)**

**Where:**

*nnnnn*
The decimal number (from 1 to 5 characters) of the record type to display.

**Explanation:** The record type specified with the ZDFCT command is not in decimal character format.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZDFCT command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZDFCT command.

---

**CDFT0003E UNIQUE RECORD TYPE NOT ALLOWED**

**Explanation:** A record type that is unique to some set of subsystem users, processors, or I-streams was specified with the ZDFCT command.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZDFCT command.

---

**CDFT0004E POOL RECORDS NOT ALLOWED**

**Explanation:** A pool record type was specified with the ZDFCT command. This function does not support pool record types.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZDFCT command.

---

**CDFT0005E THE RECORD TYPE INDICATOR IS INVALID**

**Explanation:** A record type that is not valid was specified with the ZDFCT command.

**System Action:** The command is rejected.

**User Response:** Enter the ZDFCT command again and specify a valid record type.

See *TPF Operations* for more information about the ZDFCT command.

---

**CDFT0006E THE REQUESTED RECORD TYPE IS NOT IN USE**

**Explanation:** The record type specified with the ZDFCT command is not in use.

**System Action:** The command is rejected.

**User Response:** Enter the ZDFCT command again and specify a valid record type.

See *TPF Operations* for more information about the ZDFCT command.

---

**CDFT0007E THE RECORD TYPE IS NOT DEFINED OR EXCEEDS THE LIMIT**

**Explanation:** The record type specified with the ZDFCT command is not defined or exceeds the record type limit.

**System Action:** The command is rejected.

**User Response:** Enter the ZDFCT command again and specify a valid record type.

See *TPF Operations* for more information about the ZDFCT command.

---

**CDFT0009E THE INPUT ORDINAL NUMBER IS OUTSIDE ALLOWABLE RANGE**

**Explanation:** This error occurred because the maximum ordinal number for the requested record type is not within the allowable range.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDFCT command.

**CDFT0012I DISPLAY FACE TABLE DATA**

**Explanation:** This is the normal response to the ZDFCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDFCT command and for an example of the informational display.

**CDSI0001I SDA *sda* SCH# *yyyy* MOUNTED**

**Where:**

*sda* The symbolic device address (SDA) for an input/output (I/O) device.

*yyyy*
The subchannel number.

**Explanation:** This is the normal response to the ZDDSI command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDDSI command.

**CDSI0002I SDA *sda* SCH# *yyyy* NOT DEFINED**

**Where:**

*sda* The symbolic device address (SDA) for an input/output (I/O) device.

*yyyy*
The subchannel number.

**Explanation:** This is the normal response to the ZDDSI command. The input/output (I/O) device specified is not currently defined to the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDDSI command.

**CDSI0003I SDA *sda* OUT OF RANGE. HIGHEST SDA is *sda***

**Where:**

*sda* The symbolic device address (SDA) for an input/output (I/O) device.

**Explanation:** An error occurred because the SDA specified for an I/O device in the ZDDSI command is greater than the TPF system's currently defined highest SDA value.

**System Action:** The command is rejected.

**User Response:** Enter the ZDDSI command again, specifying a value for the SDA that is less than or equal to the current highest SDA value for the TPF system.

See *TPF Operations* for more information about the ZDDSI command.

# CEFR

**CEFR0154E *zzzz nnnn* DEVICE *cuu* ASSIGNED ELSEWHERE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A unit check was received with associated sense data containing a message code that indicates the device is assigned elsewhere. This message indicates that the device is in use by another operating system.

**System Action:** A system error may be issued depending on the type of operation performed. The next operation on the module queue is started.

**User Response:** Do one of the following:

- Release the device from the other operating system.
- Vary the device offline from the TPF system.

**CEFR0179E *zzzz nnnn* DEVICE *cuu* CHANNEL PROTOCOL ERROR**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A channel protocol error was reported for the device.

**System Action:** The input/output (I/O) ends with a permanent error.

**User Response:** None.

**CEFR0180E** *zzzz nnnn* **TAPE** *yyy* **ON DEVICE** *cuu* **END OF DATA DETECTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

**Explanation:** An attempt was made to read beyond valid data or backward through data that is not valid. Normally, this means that the volume was not closed correctly when it was written.

**System Action:** The subsystem accepts more attempts to recover any valid data beyond the end-of-data marker. The subsystem returns the correct error codes for any more errors that are found.

**User Response:** None.

---

**CEFR0187E** *zzzz nnnn* **DEVICE** *cuu* **DELETED CONFIGURATION ERROR**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** Path verification processing detected that one or more paths failed to lead to the same device as defined in the IOCP generation.

**System Action:** The device is deleted from the tape status table.

**User Response:** Verify that IOCP path definitions are correct and that the device is installed correctly.

---

**CEFR0204E** *zzzz nnnn* **DEVICE** *cuu* **— OPERATOR INTERVENTION REQUIRED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An error was received while trying to process a ZTOFF *cuu* command entered to a standby or alternate (ALT) tape.

**System Action:** None.

**User Response:** None.

---

**CEFR0233E** ***CP*** *nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **MISPLACED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The TPF system detected a misplaced volume.

**System Action:** None.

**User Response:** Determine why the volume became misplaced.

---

**CEFR0239E** ***CP*** *nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **INACCESSIBLE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The library function cannot be completed successfully because the volume serial number (VSN) referenced in the message cannot be accessed.

**System Action:** The operation is ended.

**User Response:** Determine why the volume cannot be accessed.

---

**CEFR0245E** ***CP*** *nnnn* **DEVICE** *cuu* **VISION SYSTEM NOT OPERATIONAL**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library function was rejected because the library vision system is not operational.

**System Action:** None.

**User Response:** Determine why the vision system is not operational.

---

**CEFR0252E** ***CP*** *nnnn* **DEVICE** *cuu* **LIBRARY MANAGER OFFLINE**

**Where:**

*nnnn*
The subsystem user (SSU).

*cuu* The device address.

**Explanation:** The library function was rejected because the control unit detected an unrecoverable error on the library attachment facility during initialization or during later command processing. There are no other operational paths

between the control unit and the library manager.

This message can also be received when the library manager is offline to the subsystem.

**System Action:** The library function ends.

**User Response:** Determine what repair actions are required.

---

**CEFR0266W** ***CP*** *nnnn* **DEVICE** *cuu* **OUTPUT STATIONS FULL**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** All convenience or bulk output stations are full.

**System Action:** None.

**User Response:** Empty one or more output stations.

---

**CEFR0276E** ***CP*** *nnnn* **DEVICE** *cuu* **LIBRARY INTERVENTION REQUIRED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** An error condition occurred in the library that an operator must fix.

**System Action:** None.

**User Response:** Do the following:

1. Put the library manager in pause mode.
2. Perform the intervention shown on the library manager console.

---

**CEFR0278E** ***CP*** *nnnn* **DEVICE** *cuu* **LIBRARY STORAGE CELLS FULL**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** All available storage cells in the library are full.

**System Action:** None.

**User Response:** Volumes must be removed from the library to make storage cells available.

---

**CEFR0279E** ***CP*** *nnnn* **DEVICE** *cuu* **LIBRARY OUT OF CLEANER VOLUMES**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** There are no cleaner volumes in the library but a clean operation is required.

**System Action:** None.

**User Response:** Add cleaner volumes to the library.

---

**CEFR0315E** ***CP*** *nnnn* **SENSE DATA LOST FOR DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A unit check condition occurred for which the accompanying sense data was reset and lost.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** None.

---

**CEFR0316E** ***CP*** *nnnn* **ALLEGIANCE RESET FOR DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The allegiance that existed for the specified device has been ended by a Reset Allegiance command. This command is typically issued by the control unit when it has been determined that a device has an allegiance to a failing control unit, channel path, or path group. This command attempts to make the device available once again.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** None.

---

**CEFR0317E** ***CP*** *nnnn* **COMMAND REJECT FOR DEVICE** *cuu* **SENSE DATA:** *bbbbbbbb bbbbbbbb bbbbbbbb bbbbbbbb*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*bbbbbbbb*
The sense data.

**Explanation:** The command was rejected because there was something incorrect about the command, its associated data, or the sequence in which the command was issued.

**System Action:** The appropriate recovery action for the indicated unit check will be performed. Usually, the input/output (I/O) operation ends with a permanent error.

**User Response:** None.

---

**CEFR0318E** ***CP** *nnnn* **PROTECTION EXCEPTION ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A command has been issued to the specified device that violates a protection control established by the control program. For example, a supervisor command was issued while supervisor commands are inhibited or a write command was issued while logical write protect is enabled for the device.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** None.

---

**CEFR0319E** ***CP** *nnnn* **PHYSICAL WRITE PROTECT ENABLED ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A write-type command was issued to the specified device for a volume that is physically write protected.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** Do the following:

1. Ensure that the correct volume is mounted for the operation being performed.
2. If it is, disable physical write protect for the volume mounted on the specified device.

---

**CEFR0320E** ***CP** *nnnn* **INCORRECT WRITE LENGTH SPECIFIED IN COMMAND FOR DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A write command was issued that specified a logical block length that was incompatible with the device or media.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** Modify the application program to specify a logical block length that is compatible with the desired device type. If you do not know if the logical block length is compatible with the desired device type, check the appropriate hardware publication.

**Note:** A tape label mask record definition may need to be created which limits the device types on which the tape may be mounted.

---

**CEFR0321E** ***CP** *nnnn* **READ-ONLY FORMAT ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A write-type command was issued to the specified device for a volume whose format is only supported for read-type operations.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** Ensure the correct volume is mounted for the operation being performed.

---

**CEFR0323E** ***CP** *nnnn* **BEGINNING OF PARTITION ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A backward motion command was issued to the specified device when the volume was positioned at the beginning of the partition.

**System Action:** The input/output (I/O) operation ends with a permanent error. The volume is left positioned at the beginning of the partition.

**User Response:** None.

---

**CEFR0325E** ***CP** *nnnn* **END OF PARTITION ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A forward motion command found the end of a partition.

**System Action:** The input/output (I/O) operation ends with a permanent error. The volume is left positioned after the last logical block processed.

**User Response:** None.

---

**CEFR0326E** ***CP** *nnnn* **WRITE DATA CHECK ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A write-type command was issued for the specified device but could not be completed successfully because of a media failure.

**System Action:** If a tape switch is permitted by the application, a tape switch will be performed and any data in the control unit buffer will be recovered and written to the standby tape. If a tape switch is not permitted, the input/output (I/O) operation ends with a permanent error. If a tape switch is permitted, this message may be followed by COSL0081A, requesting that you mount a standby tape. If the COSK0202I message, which indicates that DDR recovery was started was received, this message should be followed by the COSK0203I message, which indicates that DDR recovery has completed successfully.

**User Response:** Do the following:

1. If the COSL0081A message is received, mount a standby tape.
2. Review the device and cartridge to determine if repair actions are necessary.
3. Review the EREP log to analyze recent activity on the device.

---

**CEFR0327E** ***CP*** *nnnn* **ERASE DATA CHECK ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An erase command was issued for the specified device but could not be completed successfully because of a media failure.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** Do the following:

1. Review the device and cartridge to determine if repair actions are necessary.
2. Review the EREP log to analyze recent activity on the device.

---

**CEFR0328E** ***CP*** *nnnn* **FORMAT DATA CHECK ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A format-type command was issued for the specified device but could not be completed successfully because of a media failure.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** Do the following:

1. Replace the cartridge in the device or move the cartridge to a different device.
2. Review the device and cartridge to determine if repair actions are necessary.
3. Review the EREP log to analyze recent activity on the device.

---

**CEFR0329E** ***CP*** *nnnn* **READ DATA CHECK ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A read-type command was issued for the specified device but could not be completed successfully because of a media failure.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** Do the following:

1. Review the device and cartridge to determine if repair actions are necessary.
2. Review the EREP log to analyze recent activity on the device.

---

**CEFR0330E** ***CP*** *nnnn* **UNSUPPORTED FORMAT ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A read-type command was issued for the specified device and an unknown or unsupported format was detected on the volume.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** Move the volume to a device that supports the format of the volume.

---

**CEFR0331E** ***CP*** *nnnn* **NO FORMATTING AT BEGINNING OF VOLUME ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A command was issued for the specified device causing access at beginning of volume (BOV), but could not be completed successfully because of missing formatting.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** Do one of the following:

- If the cartridge is being used for output, initialize the cartridge by entering the ZTINT command, ensuring that the desired format is specified.
- If the cartridge is being used for input, the cartridge must be re-created.

---

**CEFR0332E** ***CP*** *nnnn* **POSITIONING LOST ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A command that was issued for the specified device could not be completed successfully because of a loss of positioning on the volume.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** None.

---

**CEFR0333E** ***CP*** *nnnn* **UNSUPPORTED READ LENGTH ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A read-type command was issued to the specified device that could not be completed successfully because it accessed a logical block with an incorrect block length.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** Move the volume to a device that is capable of reading the block length. You may need to create a Tape Label Mask Record definition that limits the device types on which the tape can be mounted.

---

**CEFR0334E** ***CP*** *nnnn* **UNSUPPORTED VOLUME ON DEVICE** *cuu***. MEDIA TYPE –** *bbbb*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*bbbb*
One of the following 4-digit hexadecimal media-type identifiers:

| Identifier | Description |
|---|---|
| **X'0120'–X'013F'** | Half-inch cartridge tapes. |
| **X'0121'** | 3480, 3490, and 3490E cartridges. |
| **X'0122'** | Enhanced Capacity Cartridge System cartridges. |
| **X'0130'** | 3590 cartridges. |
| **X'FFFF'** | Sense format is not valid. |

**Explanation:** A command that was issued to the specified device could not be completed successfully because an incompatible volume is mounted on the device.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** Do one of the following:

- If the media-type identifier is X'FFFF', notify system support.
- Otherwise, move the volume to a device that supports the indicated media.

---

**CEFR0335E** ***CP*** *nnnn* **VOLUME LENGTH ERROR ON DEVICE** *cuu***. MEDIA TYPE –** *bbbb*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*bbbb*
One of the following 4-digit hexadecimal media-type identifiers:

| Identifier | Description |
|---|---|
| **X'0120'–X'013F'** | Half-inch cartridge tapes. |
| **X'0121'** | 3480, 3490, and 3490E cartridges. |
| **X'0122'** | Enhanced Capacity Cartridge System cartridges. |
| **X'0130'** | 3590 cartridges. |
| **X'FFFF'** | Sense format is not valid. |

**Explanation:** A command that was issued to the specified device could not be completed successfully because the volume mounted on the device has a medium length error. This error precludes subsequent read or write processing of the volume.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** Do one of the following:

- If the media-type identifier is X'FFFF', notify system support.
- Otherwise, move the volume to a device that supports the indicated media.

---

**CEFR0336E** ***CP*** *nnnn* **VOLUME REMOVED ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A command that was issued to the specified device could not be completed successfully because the volume has been removed from the device.

**System Action:** If a tape switch is permitted by the application, a tape switch will be performed and any data in the control unit buffer will be recovered and written to the standby tape. If a tape switch is not permitted, the input/output (I/O) operation ends with a permanent error. If a tape switch is performed, this message may be followed by the COSL0081A message, requesting that you mount a standby tape. If the COSK0202I message, which indicates that DDR recovery was started was received, this message should be followed by the COSK0203I message, which indicates that DDR recovery is complete.

**User Response:** If the COSL0081A message is received, mount a standby tape.

---

**CEFR0337E** ***CP*** *nnnn* **LOAD CHECK ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A command that was issued to the specified device could not be completed successfully because the mounted volume found a load check on the device.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** Remove the volume from the failing device and mount it on the same device again or on another device.

---

**CEFR0338E** ***CP*** *nnnn* **UNLOAD CHECK ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A command that was issued to the specified device could not be completed successfully because the mounted volume found an unload check on the device.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** Review the device and cartridge to determine if repair actions are required.

---

**CEFR0339E** ***CP*** *nnnn* **EQUIPMENT CHECK ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A command that was issued to the specified device could not be completed successfully because of an equipment failure in the input/output (I/O) subsystem.

**System Action:** If a tape switch is permitted by the application, a tape switch will be performed and any data in the control unit buffer will be recovered and written to the standby tape.

If a tape switch is not permitted, the I/O operation ends with a permanent error.

If a tape switch is performed, this message may be followed by the COSL0081A message, requesting that you mount a standby tape.

If the COSK0202I message, which indicates that DDR recovery was started was received, this message should be followed by the COSK0203I message, which indicates that DDR recovery is complete.

**User Response:** If the COSL0081A message is received, mount a standby tape.

---

**CEFR0340E** ***CP*** *nnnn* **INTERFACE CHECK ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The channel or the control unit has detected an error that prevents the current command from completing successfully.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** None.

---

**CEFR0341I** ***CP*** *nnnn* **OVERRUN ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The required data or command was not transferred by the channel in the time limit required for the specified device.

**System Action:** The input/output (I/O) operation will be issued again using a different channel path, if one exists. If no paths exist, the I/O operation ends with a permanent error.

**User Response:** None.

---

**CEFR0342E** ***CP*** *nnnn* **HALT SIGNAL DETECTED ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A halt signal was issued by the channel before the required amount of data was received.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** None.

---

**CEFR0343E** ***CP* *nnnn* DEVICE *cuu* FENCED**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The input/output (I/O) subsystem has determined that the specified device is no longer operational.

**System Action:** The I/O operation ends with a permanent error and additional I/O to the device is inhibited.

**User Response:** Do the following:

1. Have the hardware problem corrected.
2. Reset the device by entering the ZTVAR DELETE command followed by the ZTVAR ADD command.

---

**CEFR0344E** ***CP* *nnnn* DEVICE PATH FENCED FOR DEVICE *cuu* AVAILABLE PATH MASK *mm***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*mm* The available path mask.

**Explanation:** The input/output (I/O) subsystem has determined that a device path pair is no longer operational.

**System Action:** The command will be issued again using another channel path.

**User Response:** None.

---

**CEFR0345E** ***CP* *nnnn* DUPLICATE VOLUME ADD REQUESTED FOR DEVICE *cuu***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An operation attempted to add a volume inventory record but a record for the volume already exists in the library.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** None.

---

**CEFR0346I** ***CP* *nnnn* LIBRARY EQUIPMENT CHECK**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** An irrecoverable error occurred for one of the elements of the library.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** None.

---

**CEFR0350I** ***CP* *nnnn* SUBSYSTEM SERVICE INFORMATION MESSAGE FOR DEVICE *cuu* SEVERITY – SERVICE. REFERENCE CODES – *rc1 – rc2 – rc3***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*rc1 – rc2 – rc3*
The reference codes that specify which actions to take.

**Explanation:** A hardware or licensed internal code error or incompatibility condition has been detected by the input/output (I/O) subsystem. Service severity indicates that there is no impact to performance.

**System Action:** The I/O operation ends with a permanent error.

**User Response:** Do one of the following:

- If a reference code of X'FF' (sense format is not valid) is displayed, notify system support.
- Otherwise, see your IBM service representative, and provide the indicated reference codes to determine which actions, if any, you must take.

---

**CEFR0351W** ***CP* *nnnn* SUBSYSTEM SERVICE INFORMATION MESSAGE FOR DEVICE *cuu* SEVERITY – MODERATE. REFERENCE CODES – *rc1 – rc2 – rc3***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*rc1 – rc2 – rc3*
The reference codes that specify which actions to take.

**Explanation:** A hardware or licensed internal code error or incompatibility condition has been detected by the input/output (I/O) subsystem. Moderate severity indicates that an error threshold has been exceeded in the control unit.

**System Action:** The I/O operation ends with a permanent error.

**User Response:** See your IBM service representative, and

provide the indicated reference codes to determine which actions, if any, you must take.

---

**CEFR0352W** ***CP*** *nnnn* **SUBSYSTEM SERVICE INFORMATION MESSAGE FOR DEVICE** *cuu* **SEVERITY – SERIOUS. REFERENCE CODES –** *rc1 – rc2 – rc3*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*rc1 – rc2 – rc3*
The reference codes that specify which actions to take.

**Explanation:** A hardware or licensed internal code error or incompatibility condition has been detected by the input/output (I/O) subsystem. Serious severity indicates that device operation has been degraded but the device is still accessible.

**System Action:** The I/O operation ends with a permanent error.

**User Response:** See your IBM service representative, and provide the indicated reference codes to determine which actions, if any, you must take.

---

**CEFR0353E** ***CP*** *nnnn* **SUBSYSTEM SERVICE INFORMATION MESSAGE FOR DEVICE** *cuu* **SEVERITY – ACUTE. REFERENCE CODES –** *rc1 – rc2 – rc3*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*rc1 – rc2 – rc3*
The reference codes that specify which actions to take.

**Explanation:** A hardware or licensed internal code error or incompatibility condition has been detected by the input/output (I/O) subsystem. Acute severity indicates that the device is no longer accessible.

**System Action:** The I/O operation ends with a permanent error.

**User Response:** See your IBM service representative, and provide the indicated reference codes to determine which actions, if any, you must take.

---

**CEFR0354I** ***CP*** *nnnn* **DEVICE SERVICE INFORMATION MESSAGE FOR DEVICE** *cuu* **SEVERITY – SERVICE. REFERENCE CODES –** *rc1 – rc2 – rc3*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*rc1 – rc2 – rc3*
The reference codes that specify which actions to take.

**Explanation:** A hardware or licensed internal code error, incompatibility condition, or required maintenance condition has been detected for the specified device. Service severity indicates that there is no impact to performance.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** See your IBM service representative, and provide the indicated reference codes to determine which actions, if any, you must take.

---

**CEFR0355W** ***CP*** *nnnn* **DEVICE SERVICE INFORMATION MESSAGE FOR DEVICE** *cuu* **SEVERITY – MODERATE. REFERENCE CODES –** *rc1 – rc2 – rc3*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*rc1 – rc2 – rc3*
The reference codes that specify which actions to take.

**Explanation:** A hardware or licensed internal code error, incompatibility condition, or required maintenance condition has been detected for the specified device. Moderate severity indicates degraded operation because of a high temporary error rate.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** See your IBM service representative, and provide the indicated reference codes to determine which actions, if any, you must take.

---

**CEFR0356W** ***CP*** *nnnn* **DEVICE SERVICE INFORMATION MESSAGE FOR DEVICE** *cuu* **SEVERITY – SERIOUS. REFERENCE CODES –** *rc1 – rc2 – rc3*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*rc1 – rc2 – rc3*
The reference codes that specify which actions to take.

**Explanation:** A hardware or licensed internal code error, incompatibility condition, or required maintenance condition has been detected for the specified device. Serious severity indicates that although device operation has been degraded, both the cartridge and the data are still accessible.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** See your IBM service representative, and provide the indicated reference codes to determine which actions, if any, you must take.

**CEFR0357E** ***CP* *nnnn* DEVICE SERVICE INFORMATION MESSAGE FOR DEVICE *cuu* SEVERITY – ACUTE. REFERENCE CODES – *rc1 – rc2 – rc3***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*rc1 – rc2 – rc3*
The reference codes that specify which actions to take.

**Explanation:** A hardware or licensed internal code error, incompatibility condition, or required maintenance condition has been detected for the specified device. Acute severity indicates that the cartridge and the data are no longer accessible.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** See your IBM service representative, and provide the indicated reference codes to determine which actions, if any, you must take.

---

**CEFR0358I** ***CP* *nnnn* LIBRARY SERVICE INFORMATION MESSAGE SEVERITY – SERVICE. REFERENCE CODES – *rc1 – rc2 – rc3***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*rc1 – rc2 – rc3*
The reference codes that specify which actions to take.

**Explanation:** A hardware or licensed internal code error or incompatibility condition has been detected for the library. Service severity indicates that there is no impact to performance.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** See your IBM service representative, and provide the indicated reference codes to determine which actions, if any, you must take.

---

**CEFR0359W** ***CP* *nnnn* LIBRARY SERVICE INFORMATION MESSAGE SEVERITY – MODERATE. REFERENCE CODES – *rc1 – rc2 – rc3***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*rc1 – rc2 – rc3*
The reference codes that specify which actions to take.

**Explanation:** A hardware or licensed internal code error or incompatibility condition has been detected for the library. Moderate severity indicates that although device operation has been degraded, the cartridge is still accessible.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** See your IBM service representative, and provide the indicated reference codes to determine which actions, if any, you must take.

---

**CEFR0360W** ***CP* *nnnn* LIBRARY SERVICE INFORMATION MESSAGE SEVERITY – SERIOUS. REFERENCE CODES – *rc1 – rc2 – rc3***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*rc1 – rc2 – rc3*
The reference codes that specify which actions to take.

**Explanation:** A hardware or licensed internal code error or incompatibility condition has been detected for the library. Serious severity indicates that device operation has been degraded and there has been some loss of cartridge accessibility.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** See your IBM service representative, and provide the indicated reference codes to determine which actions, if any, you must take.

---

**CEFR0361E** ***CP* *nnnn* LIBRARY SERVICE INFORMATION MESSAGE SEVERITY – ACUTE. REFERENCE CODES – *rc1 – rc2 – rc3***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*rc1 – rc2 – rc3*
The reference codes that specify which actions to take.

**Explanation:** A hardware or licensed internal code error or incompatibility condition has been detected for the library. Acute severity indicates that the cartridge is no longer accessible.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** See your IBM service representative, and provide the indicated reference codes to determine which actions, if any, you must take.

---

**CEFR0362I** ***CP* *nnnn* DEVICE *cuu* UNSUPPORTED MESSAGE CODE *mc* DETECTED.**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*mc* The message code.

**Explanation:** A unit check condition occurred for the indicated device. The associated sense data contained an unsupported message code.

**System Action:** The recovery action code in the sense data will be interrogated to determine the appropriate recovery action.

**User Response:** Run diagnostics on the device to determine why an unsupported message code was generated.

---

**CEFR0363I** ***CP*** *nnnn* **DEVICE** *cuu* **UNSUPPORTED LOGGING CODE** *lc* **DETECTED.**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*lc* The logging code.

**Explanation:** A unit check condition occurred for the indicated device. The associated sense data contained an unsupported logging code.

**System Action:** The recovery action code in the sense data will be interrogated to determine the appropriate recovery action.

**User Response:** Run diagnostics on the device to determine why an unsupported logging code was generated.

---

**CEFR0364I** *zzzz nnnn* **DEVICE** *cuu* **UNSUPPORTED BASIC RECOVERY ACTION CODE** *brac* **DETECTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*brac*
The basic recovery action code.

**Explanation:** A unit check was received with associated sense data containing a currently unsupported basic recovery action code.

**System Action:** None.

**User Response:** See your IBM representative and provide the unsupported recovery action code that was received.

---

**CEFR0365I** ***CP*** *nnnn* **BUS OUT CHECK ON DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A command was issued to the specified device that could not be completed successfully because a hardware error was detected on the channel path.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** None.

---

**CEFR0366I** ***CP*** *nnnn* **DEVICE** *cuu* **VOLUME IN INPUT STATION**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The library detected that a cartridge in the input station:

- Had the same volume serial number (VSN) as another volume in the library
- Had an unreadable external volume serial number (VSN)
- Did not have an external label.

**System Action:** The command is issued again or processing continues with the next command.

**User Response:** Do the following:

1. Retrieve the volume from the input station and review the external volume serial number (VSN).
2. Determine why the external VSN was a duplicate, was unreadable, or was missing.

---

**CEFR0367E** ***CP*** *nnnn* **DEVICE** *cuu* **ALL CATEGORIES RESERVED**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** All categories are already reserved.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** The entry cannot be done until a category is released.

---

**CEFR0368E** ***CP*** *nnnn* **DEVICE** *cuu* **LIBRARY MANAGER EQUIPMENT CHECK**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The library manager has become non-operational.

**System Action:** The command is issued again or processing continues with the next command. An operational-state-

change message is also generated.

**User Response:** Check the status of the library manager to determine the cause of the failure.

---

**CEFR0369E** ***CP*** *nnnn* **DEVICE** *cuu* **BLOCK** *blockid* **NOT FOUND**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*blockid*
The 8-hexadecimal number of the block.

**Explanation:** A locate block command has been issued but the block before the specified logical block could not be found or could not be verified.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** Review the indicated tape block by entering the ZDEBE command or some other tape browsing utility.

---

**CEFR0370I** ***CP*** *nnnn* **DEVICE** *cuu* **SUBSYSTEM ENVIRONMENTAL ALERT**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A condition was detected in the subsystem that relates to its operational environment and continued operation is not possible.

**System Action:** The command is reissued or processing continues with the next command.

**User Response:** Check the status of the subsystem to determine the cause of the failure.

---

**CEFR0371I** ***CP*** *nnnn* **DEVICE** *cuu* **LOADER INTERVENTION REQUIRED**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A stage-type command has requested a medium transport operation and the loader requires manual intervention for a condition other than a cell empty or cell full condition.

**System Action:** The command will be reissued.

**User Response:** Check the status of the loader to determine what actions need to be taken.

---

**CEFR0378E** ***CP*** *nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **VOLUME EJECTED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The library found a volume in a condition other than that shown in the inventory. The volume is ejected from the library.

**System Action:** None.

**User Response:** Do the following:

1. Retrieve the volume from the output station.
2. Determine the discrepancy between the inventory and the volume.

---

**CEFR0379W** ***CP*** *nnnn* **DEVICE** *cuu* **STATION DOOR OPEN**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The station door is open.

**System Action:** None.

**User Response:** Close the station door.

---

**CEFR0391E** **NO FORMATTING BEYOND BEGINNING OF VOLUME ON DEVICE** *cuu*

**Where:**

*cuu* The tape device address.

**Explanation:** A command was issued for the specified tape device, that caused access beyond the beginning of volume (BOV), but could not be completed successfully because the formatting was missing.

**System Action:** The I/O operation ends with a permanent error.

**User Response:** Do one of the following:

- If the tape cartridge is being used for output, initialize the cartridge by entering the ZTINT command, ensuring that the desired tape format is specified.
- If the tape cartridge is being used for input, the cartridge must be re-created.

See *TPF Operations* for more information about the ZTINT command.

---

**CEFR0392W** ***CP* *nnnn* MEDIUM INFORMATION MESSAGE FOR VOLUME ON DEVICE *cuu* SEVERITY – MODERATE. REFERENCE MESSAGE CODE – *mc***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*mc* The message code.

**Explanation:** A medium error or exception has been detected for the volume loaded on the specified device. Moderate severity indicates that a high number of temporary read errors, write errors, or both were detected.

**System Action:** The I/O operation ends with a permanent error.

**User Response:** See your IBM service representative, and provide the indicated message code to determine what actions, if any, you must take.

**CEFR0393W** ***CP* *nnnn* MEDIUM INFORMATION MESSAGE FOR VOLUME ON DEVICE *cuu* SEVERITY – SERIOUS. REFERENCE MESSAGE CODE – *mc***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*mc* The message code.

**Explanation:** A medium error or exception has been detected for the volume loaded on the specified device. Serious severity indicates that permanent read errors or write errors were detected.

**System Action:** The I/O operation ends with a permanent error.

**User Response:** See your IBM service representative, and provide the indicated message code to determine what actions, if any, you must take.

**CEFR0394E** ***CP* *nnnn* MEDIUM INFORMATION MESSAGE FOR VOLUME ON DEVICE *cuu* SEVERITY – ACUTE. REFERENCE MESSAGE CODE – *mc***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*mc* The message code.

**Explanation:** A medium error or exception has been detected for the volume loaded on the specified device. Acute severity indicates that a VOL1 label, length, or severe volume control region error was detected.

**System Action:** The I/O operation ends with a permanent error.

**User Response:** See your IBM service representative, and provide the indicated message code to determine what actions, if any, you must take.

**CEFR0395E** ***CP* *nnnn* LIMITED SHARED ACCESS VIOLATION BY DEVICE *cuu***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A limited shared access violation has been detected on the specified device.

**System Action:** The I/O operation ends with a permanent error.

**User Response:** Eject the volume that is currently loaded.

# CFAI–CFIN

**CFAI0002I** **DISPLAY FOR FIXED RECORD BEGINS**

**Explanation:** This is the normal response to the ZDFAI command with the file address for a fixed file record specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDFAI command and for an example of the informational display.

**CFAI0003I** **DISPLAY FOR POOL RECORD BEGINS**

**Explanation:** This is the normal response to the ZDFAI command with the file address for a pool record specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDFAI command and for an example of the informational display.

**CFAI0004I** **DISPLAY FOR INACTIVE POOL SECTION RECORD BEGINS**

**Explanation:** This is the normal response to the ZDFAI command with the file address for a pool record specified. The pool section that contains this file address is not active, so only the pool section and ordinal number for this pool record can be displayed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDFAI command and for an example of the informational display.

**CFAI0050E INPUT FILE ADDRESS NOT 4 OR 8 BYTES IN LENGTH**

**Explanation:** The ZDFAI command was entered, but the specified file address is not 4 or 8 bytes in length.

**System Action:** The command is rejected.

**User Response:** Enter the ZDFAI command again and specify either a 4- or 8-byte file address.

See *TPF Operations* for more information about the ZDFAI command.

**CFAI0051E FILE ADDRESS IS NOT VALID**

**Explanation:** The ZDFAI command was entered, but the ESFAC macro was unable to convert the specified file address.

**System Action:** The command is rejected.

**User Response:** Enter the ZDFAI command again and specify a valid file address.

See *TPF Operations* for more information about the ZDFAI command. See *TPF System Macros* for more information about the ESFAC macro.

**CFAI0052E FACS ERROR DIRECTORY RECORD**

**Explanation:** The ZDFAI command was entered, but an error occurred because the file address for the pool directory record (#SONRI) could not be obtained. The ZDFAI command must read the pool directory to determine if a pool address is in use.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine why the pool directory record file address could not be resolved.
2. Correct the problem.
3. Enter the ZDFAI command again.

See *TPF Operations* for more information about the ZDFAI command.

**CFAI0053E FIND ERROR DIRECTORY RECORD**

**Explanation:** The ZDFAI command was entered, but an error occurred because a request to find the file address for the pool directory record (#SONRI) failed. The ZDFAI command must read the pool directory to determine if a pool address is in use.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine why the find request for the pool directory record file address failed.
2. Correct the problem.
3. Enter the ZDFAI command again.

See *TPF Operations* for more information about the ZDFAI command.

**CFCA0002E CONNECTION ATTEMPT FAILED TO COUPLING FACILITY *cfname* – CONNECT RETURN CODE WAS *retcode***

**Where:**

*cfname*
The name of the coupling facility (CF).

*retcode*
The return code.

**Explanation:** While trying to create a CF cache structure, an attempt to connect to the CF specified was not successful.

**System Action:** The connection request is rejected.

**User Response:** See your IBM service representative.

See *TPF System Macros* for more information about the CFCONC macro.

**CFCA0003E CONNECTION ATTEMPT FAILED TO COUPLING FACILITY *cfname* – AVAILABLE VECTOR LENGTH FOR CACHE STRUCTURE IS *size* AND LESS THAN THE REQUESTED VECTOR LENGTH OF *reqsize***

**Where:**

*cfname*
The name of the coupling facility (CF).

*size* The number of cache vector entries available.

*reqsize*
The number of cache vector entries requested.

**Explanation:** While trying to create a CF cache structure, an attempt to connect to the CF specified was not successful because there were not enough vector entries available in the processor.

**System Action:** The connection request is rejected.

**User Response:** IPL the processor.

See *TPF System Macros* for more information about the CFCONC macro.

**CFCA0004E CONNECTION ATTEMPT FAILED TO COUPLING FACILITY *cfname* – SIZE AVAILABLE FOR CACHE STRUCTURES IS *size* LESS THAN THE REQUESTED SIZE OF *reqsize***

**Where:**

*cfname*
The name of the coupling facility (CF).

*size* The space available in the CF for the CF cache structure.

*reqsize*
The size requested for the CF cache structure.

**Explanation:** While trying to create a CF cache structure, an attempt to connect to the CF specified was not successful because there is not enough space available on the CF to create the CF cache structure.

**System Action:** The connection request is rejected.

**User Response:** See your IBM service representative for more

information about ensuring there is enough space available on the CF for CF cache structures.

See *TPF System Macros* for more information about the CFCONC macro.

---

**CFCA0006E NEWCFCACHE ERROR – NO LOCKING CF DEFINED**

**Explanation:** A NEWCFCACHE function call was issued to request a new coupling facility (CF) cache structure, but no CFs have been added to the CF locking configuration by entering the ZCFLK ADD command.

**System Action:** The request is rejected.

**User Response:** Enter the ZCFLK ADD command to add a CF to the CF locking configuration, which then enables the CF for use as an external locking facility (XLF) so new locks can be stored on it.

See *TPF Operations* for more information about the ZCFLK ADD command.

---

**CFCC0020E I/O ERROR READING *record* FILE ADDRESS REFERENCE WORD *farw* SUD *indicator***

**Where:**

*record*
The type of record in the #CFREC or #CF2LR record types, which can be one of the following:

**CFSB**
Coupling facility structure block.

**CFST**
Coupling facility status table.

**CFLR**
Coupling facility locking record (CFLR)

**CFDL**
Coupling facility distribution list (CFDL)

**IPLI**
Initial program load (IPL) inhibitor record.

*farw*
The file address reference word that is used to read the record.

*indicator*
The detail data level error indicator.

**Explanation:** An error occurred while reading a coupling facility (CF) record at the specified file address.

**System Action:** The TPF system displays additional messages that describe the error.

**User Response:** Do the following:

1. Refer to the SUD and the file address reference word information to determine the cause of the error.
2. Correct the error.

See *TPF General Macros* for more information about the SUD.

---

**CFCC0021E FACS ERROR CALCULATING ADDRESS OF *record* RECORD TYPE *rectype* ORDINAL NUMBER *ordnum***

**Where:**

*record*
The type of record in the #CFREC record type, which can be one of the following:

**CFSB**
Coupling facility structure block.

**CFST**
Coupling facility status table.

*rectype*
The record type of the record.

*ordnum*
The ordinal number of the record.

**Explanation:** The file address compute (FACE) program for symbolic record types (FACS) returned an error while calculating the file address of a coupling facility (CF) record. Either the FACE table is damaged or the record type does not exist.

**System Action:** The TPF system displays additional messages.

**User Response:** Do the following:

1. Correct the FACE table if necessary.
2. Define the record type if CF support is needed.

See *TPF Application Programming* for more information about the FACS and FACE tables. See *TPF Database Reference* for more information about coupling facility support.

---

**CFCC0022E *segment* – UNABLE TO OBTAIN SUFFICIENT RETRY BUFFERS FOR COUPLING FACILITY *cfname***

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** During TPF restart processing for the CF specified in the message, the TPF system was unable to obtain sufficient retry buffers. This error is usually received after one or more TPF systems attached to the specified CF did not have an initial program load (IPL) performed again or were not deactivated after a system failure.

**System Action:** Processing continues. Normal CF operations are unaffected. However, the TPF system may not be able to perform the apropriate error recovery procedure in the event that certain CF errors are encountered.

**User Response:** Enter the ZPSMS command to properly deactivate any TPF systems that were attached to the specified CF when a system failure occurred.

See *TPF Operations* for more information about the ZPSMS command.

---

**CFCC0024W** *segment* **– COUPLING FACILITY** *cfname* **IS UNAVAILABLE**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** During CF restart, no symbolic device addresses (SDAs) were found for the CF. The CF was previously added for the processor and was expected to be attached to the processor.

**System Action:** The CF is disabled and restart continues.

**User Response:** Do one of the following:

- If the CF is no longer required, enter the ZMCFT DELETE command to delete it from the processor configuration.
- If the CF is still required, reconfigure it for the processor and enter the ZMCFT ENABLE command to enable the CF.

See *TPF Operations* for more information about the ZMCFT DELETE and ZMCFT ENABLE commands.

---

**CFCC0025I** *segment* **– COUPLING FACILITY RESTART COMPLETED**

**Where:**

*segment*
The name of the segment that completed restart.

**Explanation:** Coupling facility (CF) restart is completed successfully.

**System Action:** The TPF system performs the next task in the restart schedule.

**User Response:** None.

---

**CFCC0028E** *segment* **– COUPLING FACILITY RESTART ENDS – UNABLE TO SET LOCK ON COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** During CF restart, an attempt to set the CF lock on the CF to serialize processing was not successful.

**System Action:** The TPF system displays additional messages that describe the error. In addition, CF functions are disabled and system restart continues.

**User Response:** Do the following:

1. Review the accompanying error messages to determine the cause of the error.
2. Correct the error.

---

**CFCC0029E** *segment* **– COUPLING FACILITY RESTART ENDS – UNABLE TO READ COUPLING FACILITY RECORD**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** During coupling facility (CF) restart, an attempt to read the CF status table (CFST) or a CF structure block (CFSB) was not successful.

**System Action:** CF functions are disabled and system restart continues.

**User Response:** Do the following:

1. Review the previous error messages to determine the cause of the error and the type of record being read.
2. Correct the error. If the error shows that the contents of the record are not valid, enter the ZIFIL command to initialize the record.
3. Perform an initial program load (IPL) of the TPF system.

See *TPF Operations* for more information about the ZIFIL command. See *TPF Database Reference* for more information about initializing the record.

---

**CFCC0031E** *segment* **– UNABLE TO DEFINE LIST NOTIFICATION VECTOR FOR COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** During CF restart, an attempt to define a list notification vector for the CF was not successful because there was not enough space available.

**System Action:** The CF is disabled and CF restart continues.

**User Response:** Perform an initial program load (IPL) of the processor using the load-clear key.

---

**CFCC0034E** *segment* **– UNABLE TO DISCONNECT FROM STRUCTURE** *strname* **ON COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*strname*
The name of the coupling facility (CF) structure.

*cfname*
The name of the CF.

**Explanation:** During CF restart, an attempt to disconnect the processor from a structure to which it is connected was not successful.

**System Action:** CF restart continues.

**User Response:** See your IBM service representative.

**CFCE0001E** *segment* **– CHANNEL CONTROL CHECK CF –** *cfname*, **DEVICE –** *sda*, **PATH –** *chpid*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

*sda* The symbolic device address (SDA).

*chpid*
The channel path.

**Explanation:** A channel control check status was received on the channel path and device referenced in the message for the CF referenced.

**System Action:** The status of any CF operation in progress is not known. The CF request is posted as complete with the ICFRRCSTATUSUNKNOWN return and reason code.

**User Response:** See your IBM service representative.

---

**CFCE0002E** *segment* **– INTERFACE CONTROL CHECK CF –** *cfname*, **DEVICE –** *sda*, **PATH –** *chpid*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

*sda* The symbolic device address (SDA).

*chpid*
The channel path.

**Explanation:** An interface control check status was received on the channel path and device referenced in the message for the CF referenced.

**System Action:** The status of any CF operation in progress is not known. The CF request is posted as complete with the ICFRRCSTATUSUNKNOWN return and reason code.

**User Response:** See your IBM service representative.

---

**CFCE0003E** *segment* **– DEVICE** *sda* **HAS BEEN REMOVED FROM CF** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

*sda* The symbolic device address (SDA).

**Explanation:** A condition was encountered that caused the device referenced in the message to be removed from the coupling facility status table (CFST) entry for the CF referenced. This device will no longer be used to perform CF operations.

**System Action:** The TPF system attempts to retry any CF operation in progress on any remaining devices for the CF referenced in the message.

**User Response:** Do the following:

1. See any preceding messages for details about the problem.
2. Correct the problem.

---

**CFCE0004E** *segment* **– PATH** *chpid* **HAS BEEN REMOVED FROM CF** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*chpid*
The channel path.

*cfname*
The name of the coupling facility (CF).

**Explanation:** A condition was encountered that caused the channel path referenced in the message to be removed from the coupling facility status table (CFST) entry of the referenced CF. This channel path will no longer be used to perform CF operations.

**System Action:** The TPF system attempts to retry any CF operation in progress on any remaining channel paths for the referenced CF.

**User Response:** Do the following:

1. See any preceding messages for details about the problem.
2. Correct the problem.

---

**CFCE0005E** *segment* **– COUPLING FACILITY** *cfname* **HAS BEEN DISABLED**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** A condition was encountered that caused the TPF system to disable the CF referenced in the message.

**System Action:** The CF will no longer be used for any CF operations.

**User Response:** Do the following:

1. See any preceding messages for details about the problem.
2. Correct the problem.
3. If you want to resume using the CF for CF operations, enter the ZMCFT ENABLE command to resume normal operations of the CF.

See *TPF Operations* for more information about the ZMCFT ENABLE command.

---

**CFCE0006E** *segment* **– RETRY BUFFER NOT AVAILABLE FOR ERROR RECOVERY ON CF** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** A CF error was encountered that required a retry buffer to perform the appropriate error recovery procedure, but no retry buffer was available. This condition was prevoiusly made known by either the MCFT0040E message or the CFCC0022E message, both of which warn that insufficient retry buffers were available when the CF was added to the system configuration, enabled, or validated during TPF restart.

**System Action:** The CF is disabled.

**User Response:** Do the following:

1. Enter the ZPSMS command to properly deactivate any TPF systems that were attached to the specified CF when a system failure occurred.
2. Enter the ZMCFT ENABLE command to enable the CF.

See *TPF Operations* for more information about the ZMCFT ENABLE and ZPSMS commands.

---

**CFCE0007E** *segment* **– PATH** *chpid* **HAS RECEIVED** *errnum* **ERRORS IN** *secnum* **SECONDS**

**Where:**

*segment*
The name of the segment that detected the error.

*chpid*
The channel path identifier (ID) of the channel path receiving errors.

*errnum*
The number of errors being reported.

*secnum*
The number of seconds in the interval during which the errors were received.

**Explanation:** The number of channel path errors indicated in the message were received on the channel path referenced in the message in the time interval indicated. The number of errors does not exceed a system-defined threshold so no further action is taken.

**System Action:** Processing continues.

**User Response:** Do one of the following if the number of errors is excessive for your complex:

- Correct the hardware by doing the following:
  1. Stop all applications that are currently using the CF.
  2. Enter the ZMCFT DELETE command to delete the CF from the processor configuration.
  3. See your IBM service representative to perform corrective service for the channel path.
  4. Enter the ZMCFT ADD command to add the CF to the processor configuration.
- See your IBM service representative to determine if modification of the system-defined error threshold is appropriate for your complex.

See *TPF Operations* for more information about the ZMCFT commands.

---

**CFCH0001I CACHE CONTROL AREA HAS NOT BEEN ALLOCATED**

**Explanation:** The ZCFCH command was entered with the DISPLAY and COUNTS parameters specified to display the current storage class counters for a specific coupling facility (CF) cache structure, but none are currently defined.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZCFCH command.

---

**CFCH0002I CF CACHE CONTROL RECORD DISPLAY**

**Explanation:** This is the normal response to the ZCFCH command with the DISPLAY and FILE parameters specified.

**System Action:** The names of the caches currently defined in the processor shared coupling facility (CF) cache control record and their assigned sizes are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZCFCH command and for an example of the informational display.

---

**CFCH0003E CACHE** *cache* **NOT FOUND**

**Where:**

*cache*
The name of the coupling facility (CF) cache structure.

**Explanation:** The ZCFCH command was entered, but the CF cache structure specified was not found.

**System Action:** The entry control block (ECB) exits.

**User Response:** Do the following:

1. Enter the ZCACH command with the DISPLAY and CTL parameters specified to view information about all the active CF cache structures.
2. Enter the ZCFCH command again and specify the name of an active CF cache structure.

See *TPF Operations* for more information about the ZCACH and ZCFCH commands.

---

**CFCH0005I CF STORAGE CLASS 1 COUNTER DISPLAY**

**Explanation:** This is the normal response to the ZCFCH command with the DISPLAY and COUNTS parameters specified to display the storage class counters for the coupling facility (CF) cache structure.

**System Action:** Processing was completed successfully with information about the current storage class counters displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZCFCH command and for an example of the informational display.

---

### CFCH0008E ERROR RETRIEVING CF STORAGE CLASS COUNTERS

**Explanation:** The ZCFCH command was entered with the DISPLAY and COUNTS parameters specified, but an error occurred while trying to retrieve the counter values.

**System Action:** The entry control block (ECB) exits.

**User Response:** Do the following:

1. Enter the ZCFCH command again with the DISPLAY and COUNTS parameters specified.
2. If the error continues, see your system programmer to determine the cause of the problem and to correct it.

See *TPF Operations* for more information about the ZCFCH command.

### CFCH0009E ERROR RETRIEVING CF CACHE CONTROL RECORD

**Explanation:** The ZCFCH command was entered to modify, remove, or display information about the coupling facility (CF) cache structure, but an error occurred while trying to find the processor shared CF cache control record.

**System Action:** The entry control block (ECB) exits.

**User Response:** Do the following:

1. Enter the ZCFCH command again.
2. If the error continues, see your system programmer to determine the cause of the problem and to correct it

See *TPF Operations* for more information about the ZCFCH command.

### CFCH0010E FACE ERROR ON CF CACHE CONTROL RECORD

**Explanation:** The ZCFCH command was entered to modify, remove, or display information about the coupling facility (CF) cache structure, but an error occurred in the file address compute (FACE) program when the file address of the processor shared CF cache control record could not be resolved.

**System Action:** The entry control block (ECB) exits.

**User Response:** Do one of the following:

- Ensure the processor shared CF cache control record is defined in the current FACE table (FCTB). If the processor shared CF cache control record is defined and the error continues, see your system programmer to determine the cause of the problem and to correct it.
- If the processor shared CF cache control record is not defined in the FCTB, define it and enter the ZCFCH command again. If the error continues, see your system programmer to determine the cause of the problem and to correct it.

See *TPF Operations* for more information about the ZCFCH command. See *TPF System Generation* for more information about the FCTB.

### CFCH0011E CF CONTROL RECORD NOT INITIALIZED, CACHE *cache* NOT FOUND

**Where:**

*cache*
The name of the coupling facility (CF) cache structure.

**Explanation:** The ZCFCH command was entered with the REMOVE parameter specified, but an error occurred because the processor shared CF cache control record was not initialized so the specified CF cache structure was not found.

**System Action:** The entry control block (ECB) exits.

**User Response:** None.

See *TPF Operations* for more information about the ZCFCH command.

### CFCH0016I CACHE *cache* SUCCESSFULLY REMOVED

**Where:**

*cache*
The name of the coupling facility (CF) cache structure.

**Explanation:** This is the normal response to the ZCFCH command with the REMOVE parameter specified.

**System Action:** The cache definition for the specified CF cache structure was removed from the processor shared CF cache control record.

**User Response:** None.

See *TPF Operations* for more information about the ZCFCH command.

### CFCH0017I CACHE *cache* SUCCESSFULLY MODIFIED

**Where:**

*cache*
The name of the coupling facility (CF) cache structure.

**Explanation:** This is the normal response to the ZCFCH command with the MODIFY parameter specified.

**System Action:** The number of entries for the CF cache structure specified in the processor shared CF cache control record is changed.

**User Response:** None.

See *TPF Operations* for more information about the ZCFCH command.

### CFCH0018E NO ENTRIES AVAILABLE IN CF CACHE CONTROL RECORD FOR MODIFICATION OF CACHE *cache*

**Where:**

*cache*
The name of the coupling facility (CF) cache structure.

**Explanation:** The ZCFCH command was entered with the MODIFY parameter specified to change the number of entries for the CF cache structure in the processor shared CF cache control record, but an error occurred because the processor shared CF cache control record already contains the maximum number of entries allowed.

**System Action:** The entry control block (ECB) exits.

**User Response:** Do the following:

1. Enter the ZCFCH command with the DISPLAY and FILE parameters specified to view all the CF cache structures currently defined in the processor shared CF cache control record.
2. Determine if the definition for a CF cache structure can be removed from the processor shared CF cache control record. If a definition can be removed, go to step 3. If a definition cannot be removed, there is no more action for you to take.
3. Enter the ZCFCH command with the REMOVE parameter specified to delete the definition for a CF cache structure.
4. Enter the ZCFCH command again with the MODIFY parameter specified to define the original CF cache structure.

See *TPF Operations* for more information about the ZCFCH command.

---

**CFCR0001I UNABLE TO OBTAIN CF LOCK FOR CF *cfname* – CURRENT HEX LOCK VALUE IS – *hexlockvalue***

**Where:**

*cfname*
The name of the coupling facility (CF).

*hexlockvalue*
The current CF lock in the CF.

**Explanation:** An error occurred when issuing the CFRQC macro with the REQUEST parameter set to SETLOCK, which sets the CF lock, because it was not available in a system-defined period of time.

**System Action:** The TPF system tries to issue the CFRQC macro again.

**User Response:** Do the following:

1. Examine the format of the CF lock to determine why it is being held.
2. Do one of the following:
   - If the function that set the CF lock ended in error, enter the ZMCFT RESETLOCK command to reset the CF lock.
   - If the function that set the CF lock did not end in error, no further action is required. The CF lock will be granted when it becomes available.

See *TPF Database Reference* for more information about the format of the CF lock. See *TPF System Macros* for more information about the CFRQC macro. See *TPF Operations* for more information about the ZMCFT RESETLOCK command.

---

**CFDT0001I PTAP — TAPE STATUS SENT TO PRINTER**

**Explanation:** This is the normal response to the ZPTAP command.

**System Action:** None.

**User Response:** None.

---

**CFDT0050E PTAP —NO PRINTER AVAILABLE**

**Explanation:** All printers are currently busy.

**System Action:** None.

**User Response:** Try your print request again at a later time.

---

**CFDT0051E PTAP —PRINTER ERROR — JOB TERMINATED**

**Explanation:** A printer error occurred.

**System Action:** The job is ended.

**User Response:** Check your printer status. If you suspect a hardware problem, see your IBM service representative.

---

**CFD20001E INVALID FORMAT: USE ZDMOD *xxx***

**Where:**

*xxx* Characters that are not valid.

**Explanation:** The format of the ZDMOD command is not valid. For example, you specified characters that are not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the ZDMOD command again.

See *TPF Operations* for more information about the ZDMOD command.

---

**CFD20002E INVALID MODULE NUMBER**

**Explanation:** The symbolic module number specified in the ZDMOD command is not defined in your TPF system.

**System Action:** The command is rejected.

**User Response:** Enter the ZDMOD command again and specify a valid module number.

See *TPF Operations* for more information about the ZDMOD command.

---

**CFD20004I MODULE *xxx***

**Where:**

*xxx* The module number whose information is displayed.

**Explanation:** This is the normal response to the ZDMOD command. This message is followed by a display of the core addresses of the file status table, the XREF table, and the control status table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDMOD command.

---

**CFIN0001W FILE SYSTEM NEEDS TO BE INITIALIZED**

**Explanation:** The CFIN file system restart segment determined that the file system must be initialized.

**System Action:** None.

**User Response:** Do the following:

1. Enter **ZFINT ON BP** to schedule file system initialization.
2. Cycle the TPF system to NORM state.

See *TPF Operations* for more information about the ZFINT command.

**CFIN0002E NO INODE OR FLOCK RECORDS AVAILABLE**

**Explanation:** The CFIN file system restart segment determined that no #INODE or #FLOCK fixed file records are on the TPF system.

**System Action:** None.

**User Response:** Load a new file address compute program (FACE) table containing the new records.

See *TPF System Generation* for more information about #INODE and #FLOCK fixed file records.

**CFIN0003I *number* NEW INODE AND FLOCK RECORDS ALLOCATED BUT NOT INITIALIZED**

**Where:**

*number*
The number of #INODE fixed file records.

**Explanation:** The CFIN file system restart segment determined that more #INODE fixed file records have been allocated to the TPF system and are not initialized to be used by the TPF system.

**System Action:** None.

**User Response:** Enter the ZFINT command with the ADD parameter specified to add the #INODE fixed file records to the file system.

See *TPF Operations* for more information about the ZFINT command. See *TPF System Generation* for more information about #INODE and #FLOCK fixed file records.

**CFIN0004I FILE SYSTEM RESTART COMPLETED *i* OF *j* INODE AND FLOCK AND *m* OF *n* IZERO RECORDS ARE IN USE**

**Explanation:** The CFIN file system restart segment was completed successfully.

**System Action:** None.

**User Response:** None.

**CFIN0005W INODE 0 RESTORED FROM FLOCK 0**

**Explanation:** The CFIN file system restart segment needed to restore the copy of #INODE fixed file record ordinal 0 from the backup copy kept in #FLOCK fixed file record ordinal 0.

**System Action:** #INODE fixed file record ordinal 0 was restored from #FLOCK fixed file record ordinal 0.

**User Response:** See your IBM service representative to determine the cause of the error.

See *TPF System Generation* for more information about #INODE and #FLOCK fixed file records.

**CFIN0006E NO SYSTEM HEAP AVAILABLE. FILE SYSTEM IS NOT USABLE**

**Explanation:** File system restart tried to get one system heap frame, but none were available.

**System Action:** The file system is not usable.

**User Response:** Enter the ZCTKA ALTER command to increase the number of system heap frames.

See *TPF Operations* for more information about the ZCTKA ALTER command.

**CFIN0007E NO IZERO RECORDS AVAILABLE**

**Explanation:** No #IZERO fixed file records were allocated on the TPF system.

**System Action:** The file system cannot be used until #IZERO fixed file records are allocated.

**User Response:** Load a new file address compute program (FACE) table that contains #IZERO fixed file records.

**CFIN0008E NO SYSTEM HEAP AVAILABLE. SHARED MEMORY IS NOT USABLE**

**Explanation:** File system restart tried to get three system heap frames, but none were available.

**System Action:** The shared memory cannot be used.

**User Response:** Enter the ZCTKA ALTER command to increase the number of system heap frames.

See *TPF Operations* for more information about the ZCTKA ALTER command.

**CFIN0009E UNABLE TO CREATE FILE SYSTEM DIRECTORY CACHE**

**Explanation:** During system restart, the file system restart program was unable to create file system directory cache.

**System Action:** System restart continues and file system directory caching is disabled.

**User Response:** Do the following:

1. Verify the amount of system heap storage allocated.
2. Increase the amount of system heap storage if there is not enough defined for all users.

See *TPF System Generation* for more information about using the CORREQ macro to verify and define system heap storage.

**CFIN0010E UNABLE TO CREATE FILE SYSTEM INODE CACHE**

**Explanation:** During system restart, the file system restart program was unable to create file system i-node cache.

**System Action:** System restart continues and file system i-node caching is disabled.

**User Response:** Do the following:

1. Verify the amount of system heap storage allocated.
2. Increase the amount of system heap storage if there is not enough defined for all users.

See *TPF System Generation* for more information about using the CORREQ macro to verify and define system heap storage.

# CFLK – CFL2

**CFLK0002I** *segment* **– COUPLING FACILITY** *cfname* **WAS ADDED TO THE LOCKING CONFIGURATION**

**Where:**

*segment*
The name of the segment that added the coupling facility (CF).

*cfname*
The name of the CF.

**Explanation:** The ZCFLK ADD command was entered to add a coupling facility (CF) to the CF locking configuration. This message indicates that the CF referenced in the message was added successfully to the CF locking configuration.

**System Action:** The coupling facility locking table (CFLT) was updated to indicate that the CF was added to the CF locking configuration.

**User Response:** None.

See *TPF Operations* for more information about the ZCFLK ADD command.

**CFLK0003I** *segment* **– COUPLING FACILITY** *cfname* **WAS DELETED FROM THE LOCKING CONFIGURATION**

**Where:**

*segment*
The name of the segment that deleted the coupling facility (CF).

*cfname*
The name of the CF.

**Explanation:** The ZCFLK DELETE command was entered to remove a CF from the CF locking configuration. This message indicates that the CF referenced in the message was deleted successfully from the CF locking configuration.

**System Action:** The coupling facility locking table (CFLT) was updated to indicate that the CF was deleted from the CF locking configuration.

**User Response:** None.

See *TPF Operations* for more information about the ZCFLK DELETE command.

**CFLK0004I** *segment* **– ZCFLK MIGRATE PROCESSING COMPLETE**

**Where:**

*segment*
The name of the segment that migrates lock residency.

**Explanation:** This is the normal response to the ZCFLK MIGRATE command. The lock residency for the modules in the coupling facility (CF) locking configuration was changed successfully from either a locking control unit (CU) to a CF, or from a CF to a locking CU.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information the ZCFLK MIGRATE command.

**CFLK0005E** *segment* **– MIGRATE ENDED – NO ADDED COUPLING FACILITIES IN THE LOCKING CONFIGURATION**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** The ZCFLK MIGRATE command was entered to change the lock residency of modules. An error occurred because there were no coupling facilities (CFs) added to the CF locking configuration from which to migrate to or from.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMCFT DISPLAY command to determine which CFs exist in the processor configuration.
2. Enter the ZCFLK ADD command to add a CF to the CF locking configuration

See *TPF Operations* for more information about the ZCFLK and ZMCFT commands.

**CFLK0006E** *segment* **– UNABLE TO READ COUPLING FACILITY LOCKING RECORD**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** A ZCFLK command was entered. However, an error occurred while trying to find a coupling facility (CF) locking record on file.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Review the preceding messages to determine the cause of the error.
2. Correct the error.

See *TPF Operations* for more information about the ZCFLK commands.

**CFLK0011I** *segment* **– ZCFLK DISPLAY STARTS**

**Where:**

*segment*
The name of the segment that issued this message.

**Explanation:** This is the normal response to the ZCFLK DISPLAY command with the ALL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCFLK DISPLAY command and for an example of the informational display.

---

**CFLK0012E** *segment* **– COUPLING FACILITY** *cfname* **DOES NOT EXIST**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** An error occurred because there were no entries in the coupling facility locking table (CFLT) or the entry you specified does not exist when one of the following occurred:

- The ZCFLK DELETE command was entered to remove a CF from the CF locking configuration.
- The ZCFLK DISPLAY command was entered to display information about the CF locking configuration.

**System Action:** One of the following occurred:

- The ZCFLK DELETE command is rejected and no CFs are deleted from the CF locking configuration.
- The ZCFLK DISPLAY command is rejected and no CF locking configuration information is displayed.

**User Response:** Do the following:

1. Verify that you specified the correct CF name when you entered the command.
2. Enter the ZCFLK DELETE or the ZCFLK DISPLAY command again, specifying a valid CF name.

See *TPF Operations* for more information about the ZCFLK commands.

---

**CFLK0013E** *segment* **– UNABLE TO OBTAIN FILE ADDRESS FOR COUPLING FACILITY LOCKING RECORD**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** The ZCFLK INITIALIZE command was entered to initialize the coupling facility (CF) locking configuration when an error occurred because the file address for the CF locking record could not be obtained.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Review the preceding messages to determine the cause of the error.
2. Correct the error.

See *TPF Operations* for more information about the ZCFLK INITIALIZE command.

---

**CFLK0015I** *segment* **– ZCFLK DISPLAY STARTS**

**Where:**

*segment*
The name of the segment that issued this message.

**Explanation:** This is the normal response to the ZCFLK DISPLAY command with a specific coupling facility (CF) specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCFLK DISPLAY command and for an example of the informational display.

---

**CFLK0018E** *segment* **– DISPLAY ENDED – NO COUPLING FACILITIES EXIST IN THE LOCKING CONFIGURATION**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** An error occurred because there were no entries found in the coupling facility locking table (CFLT) when the ZCFLK DISPLAY command with the ALL parameter specified was entered to display information about all CFs in the CF locking configuration.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZCFLK DISPLAY command.

---

**CFLK0019E** *segment* **– ADD ENDED – COUPLING FACILITY** *cfname* **WAS ALREADY ADDED TO THE LOCKING CONFIGURATION**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZCFLK ADD command was entered to add a CF to the CF locking configuration. An error occurred because the CF was already added through a previous ZCFLK ADD command.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Verify that you specified the correct CF name when you entered the ZCFLK ADD command.

2. Enter the ZCFLK ADD command again, specifying the correct CF name.

See *TPF Operations* for more information about the ZCFLK ADD command.

---

**CFLK0020E** *segment* **– MIGRATE ENDED – INPUT MODULE NUMBER RANGE IS NOT IN THE RANGE OF REALTIME MODULES**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** The ZCFLK MIGRATE command was entered to change the lock residency of modules in the CF locking configuration and migrate the corresponding locking facilities. An error occurred because the range of symbolic module numbers specified to migrate (either one module number or multiple module numbers) did not fall in the correct range of real-time modules for this subsystem.

**System Action:** The command is rejected and no modules were migrated.

**User Response:** Do the following:

1. Determine the correct range of relative symbolic numbers to migrate.
2. Enter the ZCFLK MIGRATE command again, specifying the correct range of symbolic module numbers for the subsystem from which the command was entered.

See *TPF Operations* for more information about the ZCFLK MIGRATE command.

---

**CFLK0021I** *segment* **– ZCFLK DISPLAY STARTS**

**Where:**

*segment*
The name of the segment that issued this message.

**Explanation:** This is the normal response to the ZCFLK DISPLAY command with the MOD parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCFLK DISPLAY command.

---

**CFLK0022E** *segment* **– DISPLAY ENDED – MODULE NUMBER** *modnum* **IS NOT VALID**

**Where:**

*segment*
The name of the segment that detected the error.

*modnum*
The symbolic input module number of a device.

**Explanation:** The ZCFLK DISPLAY command was entered with the MOD parameter specified to view information about a specific module in the coupling facility (CF) locking configuration. An error occurred because the module number specified was not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Verify that you specified the correct module number when you entered the ZCFLK DISPLAY command with the MOD parameter specified.
2. Enter the ZCFLK DISPLAY command again, specifying the correct module number.

See *TPF Operations* for more information about the ZCFLK DISPLAY command.

---

**CFLK0023E** *segment* **– DISPLAY ENDED – THE CF LOCKING DATABASE IS INITIALIZED – NO MODULES ARE ASSIGNED TO CF LOCKING**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** The ZCFLK DISPLAY command was entered with the MOD parameter specified to view information about a specific module in the coupling facility (CF) locking configuration. An error occurred when the TPF system tried to access the distribution list slot for the module and found that the CF locking database was initialized through the ZCFLK INITIALIZE command. As a result, no CFs were added to the CF locking configuration so there is no CF available to which the lock residency of the module can be assigned.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMCFT ADD command to add the CF for the processor to the processor configuration.
2. Enter the ZCFLK ADD command to add the CF to the CF locking configuration.
3. Enter the ZCFLK DISPLAY command again.

See *TPF Operations* for more information about the ZMCFT ADD command and the ZCFLK commands.

---

**CFLK0024E** *segment* **– ADD ENDED – SIZE SPECIFIED IS TOO SMALL**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** The ZCFLK ADD command was entered with the SIZE parameter specified to add a coupling facility (CF) to the CF locking configuration. An error occurred because the number of 4K blocks specified is less than the minimum size allowed, which is one thousand 4K blocks.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. See the *TPF Database Reference* and your data collection information to determine a reasonable size based on your current lockspace requirements.
2. Enter the ZCFLK ADD command again, specifying a valid number of 4 K blocks that is greater than or equal to the minimum size allowed.

See *TPF Operations* for more information about the ZCFLK ADD command. See the *TPF Database Reference* for more information about lockspace requirements.

---

**CFLK0025E** *segment* **– ADD ENDED – THE COUPLING FACILITY LOCKING CONTROL TABLE IS FULL**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** The ZCFLK ADD command was entered to add a coupling facility (CF) to the CF locking configuration. An error occurred because there were no available entries in the CF locking control table (CFLCT).

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter **ZCFLK DISPLAY ALL** to view the CFs defined in the CF locking configuration.
2. Enter the ZCFLK DELETE command to remove any CFs that are no longer needed from the CF locking configuration.
3. Enter the ZCFLK ADD command again to add the CF to the CF locking configuration.

See *TPF Operations* for more information about the ZCFLK commands.

---

**CFLK0026E** *segment* **– ZCFLK COMMANDS ARE NOT SUPPORTED ON A LOADER GENERAL FILE IPL**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** An error occurred because a ZCFLK command was entered during a loader general file (LGF) initial program load (IPL). The ZCFLK command cannot be entered at this time because the coupling facility locking table (CFLT) was not built in storage during restart.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait for the IPL of the loader general file (LGF) to complete.
2. Enter the ZCFLK command again.

See *TPF Operations* for more information about the ZCFLK and ZIFIL commands.

---

**CFLK0027E** *segment* **– UNABLE TO FILE COUPLING FACILITY LOCKING RECORD**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** A file error occurred while filing a coupling facility locking record (CFLR) in the coupling facility locking control table (CFLCT).

**System Action:** The request ends.

**User Response:** Do the following:

1. Review the preceding error messages to determine the cause of the error.
2. Correct the error.

---

**CFLK0028I** *segment* **– THE COUPLING FACILITY LOCKING DATABASE HAS BEEN INITIALIZED SUCCESSFULLY**

**Where:**

*segment*
The name of the segment that initialized the database.

**Explanation:** The ZCFLK INITIALIZE command was entered to initialize the coupling facility (CF) locking configuration. The CF locking database was cleared and initialized for use successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCFLK INITIALIZE command.

---

**CFLK0029T** *segment* **– CONNECTION ATTEMPT FAILED TO COUPLING FACILITY** *cfname* **– CONNECT RETURN CODE WAS** *retcode*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

*retcode*
The return code.

**Explanation:** The ZCFLK ADD command was entered to add a CF to the CF locking configuration. An error occurred while connecting to the CF.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative.

See *TPF Operations* for more information about the ZCFLK ADD command. See *TPF System Macros* for more information about the CFCONC macro.

---

**CFLK0030E** *segment* **– ADD ENDED – A ZMCFT ADD HAD NOT BEEN DONE FOR COUPLING FACILITY** *cfname* **ON THIS PROCESSOR**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZCFLK ADD command was entered to add a CF to the CF locking configuration. One of the following errors occurred:

- The CF name specified is not correct.

- The CF specified was not added previously to the processor by using the ZMCFT ADD command.

**System Action:** The command is rejected and the CF is not added to the CF locking configuration.

**User Response:** Do the following:

1. Enter **ZMCFT DISPLAY ALL** to view the CFs defined in the processor configuration.
2. Do one of the following:
   - If the CF is defined in the processor configuration, verify that the correct CF name was specified when you entered the ZCFLK ADD command. Enter the ZCFLK ADD command again, specifying a valid CF name.
   - If the CF is ***not*** defined in the processor configuration, enter the ZMCFT ADD command to add the CF to the processor configuration. Enter the ZCFLK ADD command again, specifying that CF name, to add the CF to the CF locking configuration.

See *TPF Operations* for more information about the ZCFLK ADD and ZMCFT commands.

---

**CFLK0031E** *segment* **– DELETE ENDED – COUPLING FACILITY** *cfname* **CANNOT BE DELETED – IT IS THE LAST CF IN THE LOCKING CONFIGURATION AND LOCKS STILL RESIDE ON IT**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZCFLK DELETE command was entered to remove a CF from the CF locking configuration. An error occurred because you tried to remove the last CF used for locking that is defined in the CF locking configuration, and at least one module is defined to use this CF for locking.

**System Action:** The command is rejected and the CF is not removed from the locking configuration.

**User Response:** Do the following:

1. Enter the ZCFLK MIGRATE command to migrate the lock residency for all affected modules back to the locking control units (CUs). If you are migrating an online module, then the duplicate module is also migrated. This is to ensure that the locks for the module reside on only a CF or a locking CU.
2. Enter the ZCFLK DELETE command again to remove the CF from the CF locking configuration.

See *TPF Operations* for more information about the ZCFLK commands.

---

**CFLK0032E** *segment* **– MIGRATE ENDED – STARTING MODULE NUMBER IS GREATER THAN THE ENDING MODULE NUMBER IN RANGE**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** The ZCFLK MIGRATE command was entered to change the lock residency of modules in the coupling facility (CF) locking configuration from a locking control unit (CU) to CF, or from CF to a locking CU. An error occurred because the starting module number specified was greater than the ending module number specified in the range of symbolic module numbers.

**System Action:** The command is rejected and the lock residency of modules in the locking configuration is not changed.

**User Response:** Enter the ZCFLK MIGRATE command again by using a valid range of symbolic module numbers by specifying a starting symbolic module number that is less than the ending module number.

See *TPF Operations* for more information about the ZCFLK MIGRATE command.

---

**CFLK0033E** *segment* **– INIT ENDED – INIT CANNOT BE PERFORMED UNLESS THIS PROCESSOR IS THE FIRST TO IPL AND IN RESTART**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** The ZCFLK INITIALIZE command was entered to initialize the coupling facility (CF) locking configuration. An error occurred because the TPF system was not the first to IPL or not in restart for processing this command. You can only use the ZCFLK INITIALIZE command the first time the TPF system comes up with CFs to add to the CF locking configuration.

**System Action:** The command is rejected. The CF locking control record was found successfully so these records were initialized and the TPF system may be using them for locking.

**User Response:** Do the following:

1. Cycle the TPF system to be the first to IPL and in restart.
2. Enter the ZCFLK INITIALIZE command again to initialize the CF locking configuration.

See *TPF Operations* for more information about the ZCFLK commands.

---

**CFLK0034E** *segment* **– A CHANGE TO THE LOCKING CONFIGURATION IS ALREADY IN PROGRESS**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** The ZCFLK ADD, ZCFLK DELETE, or ZCFLK MIGRATE command was entered when the coupling facility (CF) locking configuration was already in the process of being changed. The CF locking configuration is changed whenever one of the following occurs:

- The ZCFLK ADD command is entered to add a CF to the CF locking configuration.
- The ZCFLK DELETE command is entered to remove a CF from the CF locking configuration.

- The ZCFLK MIGRATE command is entered to change the lock residency of modules from a multi-path lock facility (MPLF) locking control unit (CU) to a CF, or from a CF to a MPLF locking CU.
- A CF is being removed from the CF locking configuration because of an error.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait for the previous request to change the CF locking configuration to complete.
2. Enter the ZCFLK ADD or ZCFLK DELETE command again.

See *TPF Operations* for more information about the ZCFLK commands.

---

**CFLK0035E** *segment* **– ADD ENDED – INSUFFICIENT SPACE FOR THE NOTIFY STRUCTURE IN COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** Due to a ZCFLK ADD command request, an attempt was made to create a CF structure on the CF for use during lock contention and lock granted notifications. However, an error occurred because there is not enough space in the CF to create the CF structure.

**System Action:** The command is rejected and the CF structure is not created.

**User Response:** Do the following:

1. Enter the ZMCFT CLEAR command to remove CF structures from a CF that are unknown to the processor configuration.
2. Enter the ZCFLK ADD command again. If there is still insufficient space on the CF to create the CF structure, enter the ZCFLK ADD command for a CF that has more space available.

See *TPF Operations* for more information about the ZCFLK ADD and ZMCFT CLEAR commands.

---

**CFLK0036E** *segment* **– ADD ENDED – INSUFFICIENT SPACE FOR THE LOCKSPACE STRUCTURE IN COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** Because of a ZCFLK ADD command request, an attempt was made to create a CF structure on the CF to be used for lock holder information. However, an error occurred because there is not enough space in the CF to create the CF structure.

**System Action:** The command is rejected and the CF structure is not created.

**User Response:** Do the following:

1. Enter the ZMCFT CLEAR command to remove CF structures from a CF that are unknown to the processor configuration.
2. Enter the ZCFLK ADD command again. If there is still insufficient space on the CF to create the CF structure, do one of the following:
   - Enter the ZCFLK ADD command again, specifying a smaller value for the SIZE parameter.
   - Enter the ZCFLK ADD command for a CF that has more space available.

See *TPF Operations* for more information about the ZCFLK ADD and ZMCFT CLEAR commands.

---

**CFLK0037E** *segment* **– ADD ENDED – UNABLE TO MONITOR THE NOTIFY STRUCTURE IN COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** Due to a ZCFLK ADD command request, an attempt was made to monitor the CF structure on the CF used for lock contention and lock granted notifications. However, an error occurred because the monitor request was not successful.

**System Action:** The command is rejected and the CF structure is not monitored.

**User Response:** Do the following:

1. Enter the ZDCFT command to view the CF trace information.
2. See your IBM service representative, and provide the CF trace information.

See *TPF Operations* for more information about the ZCFLK ADD and ZDCFT commands.

---

**CFLK0038E** *segment* **– ADD ENDED – ALL PROCESSORS COULD NOT CONNECT TO COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZCFLK ADD command was entered to add a CF to the CF locking configuration. In order for this request to be successful, all processors in the processor configuration must be connected to the CF. An error occurred in this case because at least one processor in the processor configuration could not connect the CF.

**System Action:** The command is rejected and the CF is not

added to the CF locking configuration.

**User Response:** See any preceding error messages for this processor or other processors for detailed information about this error.

See *TPF Operations* for more information about the ZCFLK ADD command.

---

**CFLK0039E** *segment* **– ADD ENDED – NO MORE STRUCTURES CAN BE CREATED ON COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** Because of a ZCFLK ADD command request an attempt was made to create CF structures on the CF. An error occurred because the CF specified already has the maximum number of allowed CF structures allocated on it.

**System Action:** The command is rejected and the CF structure is not created on the CF.

**User Response:** Do the following:

1. Enter the ZMCFT CLEAR command to remove CF structures from the CF that are unknown to the processor configuration.
2. Enter the ZCFLK ADD command again. If the CF structure still cannot be created on this CF, continue with step 3. If you can create the CF structure, there is no further action for you to take.
3. Enter the ZMCFT DISPLAY command to view the status of one or more CFs in the processor configuration and to determine which CF structures are allocated on a CF.
4. Enter the ZCFLK ADD command for a CF that has fewer CF structures allocated on it.

See *TPF Operations* for more information about the ZMCFT and ZCFLK commands.

---

**CFLK0040E** *segment* **– MIGRATE ENDED – CANNOT MIGRATE BACK TO NON-MPLF CONTROL UNITS WHILE LOOSELY COUPLED**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** The ZCFLK MIGRATE command was entered to migrate the lock residency for all affected modules back to the locking control units (CUs). An error occurred because at least one of the locking CUs is a non-multi-path lock facility (MPLF) CU in a loosely coupled complex.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Ensure that all CUs are MPLF CUs in a loosely coupled complex or the TPF system that is running in uniprocessor mode.
2. Enter the ZCFLK MIGRATE command again.

See *TPF Operations* for more information about the ZCFLK MIGRATE message.

---

**CFLK0041T** *segment* **– STRUCTURE DOES NOT EXIST ON COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** Because of a ZCFLK ADD command request was entered from one processor an attempt was made to create CF structures on a CF and was successful. However, an attempt to connect to these CF structures by another processor in the processor configuration was not successful because the CF structures no longer exist.

**System Action:** The command is rejected.

**User Response:** Enter the ZCFLK ADD command again.

See *TPF Operations* for more information about the ZCFLK ADD command.

---

**CFLK0042T** *segment* **– COUPLING FACILITY LOCKING TABLE ENTRY VALIDATION FAILED**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** The ZCFLK ADD command that was entered was not successful because the entry in the coupling facility locking table (CFLT) was not in the correct state. One of the following errors occurred:

- The entry was in use already or did not contain the correct ID.
- The ZCFLK ADD command entered previously did not complete successfully.
- There is storage corruption.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZCFLK ADD command again. If the error occurs again, continue with step 2. If you the error does not occur again, there is no further action for you to take.
2. Perform an initial program load (IPL) for the processor, and then enter the ZCFLK ADD command again.

See *TPF Operations* for more information about the ZCFLK ADD command.

---

**CFLK0043E** *segment* **– COUPLING FACILITY** *cfname* **WAS DELETED FROM THE LOCKING CONFIGURATION DUE TO ERROR**

**Where:**

*segment*
The name of the segment that deleted the coupling facility (CF).

*cfname*
The name of the CF.

**Explanation:** This message indicates that the CF referenced in the message was deleted from the CF locking configuration because of bad return codes.

**System Action:** The CF entry is removed from the coupling facility locking table (CFLT) so it can no longer be used for record locking purposes. The lock residency for all locks stored on this CF are redispursed automatically among the remaining CFs in the CF locking configuration on a module-by-module basis. As a result, locks can no longer be stored on this CF and the CF is removed from the CF locking configuration.

**User Response:** See any preceding error messages for this processor or other processors for detailed information about this error.

---

**CFLK0045E** *segment* **– A MODULE IS CURRENTLY IN COPY – PLEASE RETRY THE ZCFLK MESSAGE WHEN THE COPY HAS COMPLETED**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** A ZCFLK ADD, ZCFLK DELETE, or ZCFLK MIGRATE command was entered while at least one module in the complex was in copy state. Since these commands may change the residency of the copy lock and the copy lock is not moved in move locks, it is best to wait for the copy to have completed before entering these ZCFLK commands.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Wait for the active module copies to complete before entering the apprорpriate ZCFLK command.
- Enter the ZMCPY ABORT command to abort the active module copies and then enter the ZCFLK command.

See *TPF Operations* for more information about the ZCFLK commands and the ZMCPY ABORT command.

---

**CFLK0046E** *segment* **– DELETE ENDED – COUPLING FACILITY** *cfname* **CANNOT BE DELETED – IT IS THE LAST CF IN THE LOCKING CONFIGURATION AND CACHING IS ENABLED FOR CF**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZCFLK DELETE command was entered to remove a CF from the CF locking configuration, but an error occurred because you tried to remove the last CF that was added and the ZCACH command with the CF ENABLE parameter specified was entered.

**System Action:** The command is rejected and the CF is not removed from the locking configuration.

**User Response:** Do the following:

- Enter the ZCACH command with the CF DISABLE parameter specified to ensure that logical record caches are not using CF cache structures.
- Enter the ZCFLK DELETE command again.

See *TPF Operations* for more information about the ZCFLK DELETE and ZCACH commands.

---

**CFLK0200I** **COUPLING FACILITY LOCKING RESTART PHASE ONE COMPLETED**

**Explanation:** Coupling facility locking restart completed successfully.

**System Action:** CF locking restart continues with the next phase.

**User Response:** None.

---

**CFLK0201E** *segment* **– ERROR RECONCILING COUPLING FACILITY LOCKING CONFIGURATION – CORRECT OR REMOVE FAILING COUPLING FACILITIES**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** One of the following errors occurred:

- No coupling facilities (CFs) were added to the processor configuration.
- No successful CF connections were made during CF locking restart.

**System Action:** Forced uniprocessor mode is set in Phase two of CF locking restart.

**User Response:** Do one of the following:

- If no CFs were were added to the processor configuration:
  1. Enter the ZMCFT ADD command to add any CFs that are available to a processor configuration.
  2. Enter the ZCFLK ADD command to add each CF to the CF locking configuration.
  3. Perform an initial program load (IPL) of the TPF system.
- If no successful CF connections were made during CF locking restart:
  1. Enter the ZCFLK DELETE command to remove the failing CFs from the locking configuration.
  2. IPL the TPF system.
- Continue running in forced uniprocessor mode.

If none of the previous actions correct the error, see your IBM service representative.

See *TPF Operations* for more information about the ZMCFT ADD, ZCFLK ADD, and ZCFLK DELETE commands.

---

**CFLK0202E** *segment* **– CONNECTION ATTEMPT FAILED TO COUPLING FACILITY** *cfname* **– CONNECT RETURN CODE WAS** *retcode*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

*retcode*
The return code.

**Explanation:** This message indicates that the connection routine did not connect successfully to the CF referenced in the message. One of the following conditions caused this error:

- An attempt to connect to the lockspace structure was not successful.
- An attempt to connect to the notify structure was not successful.

All of these conditions must be met successfully to use the CF for locking.

**System Action:** Forced uniprocessor mode is set in Phase two of CF locking restart.

**User Response:** Correct the error indicated by the return code.

See *TPF System Macros* for more information about the CFCONC macro.

---

**CFLK0204I** **COUPLING FACILITY LOCKING RESTART PHASE TWO COMPLETED**

**Explanation:** Phase two of coupling facility (CF) locking restart completed successfully.

**System Action:** Restart continues.

**User Response:** None.

---

**CFLK0205E** *segment* **– CONNECTION ATTEMPT FAILED TO COUPLING FACILITY** *cfname* **– INSUFFICIENT SPACE FOR STRUCTURE** *structure* **SIZE REQUESTED** *size-requested* **SIZE RETURNED** *size-returned*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the CF.

*structure*
The name of the coupling facility (CF) structure.

*size-requested*
The decimal number of 4-KB blocks requested.

*size-returned*
The decimal number of 4-KB blocks returned.

**Explanation:** An error occurred on a connect because the CF structure size that was returned was less than the size requested for that structure.

**System Action:** The TPF system is forced into uniprocessor mode.

**User Response:** Do the following:

1. Enter the ZMCFT CLEAR command to remove CF structures from a CF that are unknown to the processor configuration.
2. Enter the ZCFLK ADD command. If there is still not enough space on the CF to create the CF structure, do one of the following:
   - Enter the ZCFLK ADD command again, specifying a smaller value for the SIZE parameter.
   - Enter the ZCFLK ADD command for a CF that has more space available.
3. Perform an initial program load (IPL) of the TPF system.

---

**CFLK0206E** *segment* **– RETURN CODE** *retcode* **FROM LEMIC CLEARUSER OPERATION STRUCTURE** *structure* **COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*retcode*
The return code.

*structure*
The name of the coupling facility (CF) structure.

*cfname*
The name of the CF.

**Explanation:** This message indicates that the `tpf_lemic` function returned a non-zero return code.

**System Action:** The TPF system is forced into uniprocessor mode.

**User Response:** Do the following:

1. Review the return code on the LEMIC macro.
2. Correct the error indicated by the return code.

See *TPF C/C++ Language Support User's Guide* for more information about the `tpf_lemic` function. See *TPF System Macros* for more information about the LEMIC macro.

---

**CFLK0207E** *segment* **– RETURN CODE** *retcode* **FROM LEMIC DELETESET OPERATION STRUCTURE** *structure* **COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*retcode*
The return code.

*structure*
The name of the coupling facility (CF) structure.

*cfname*
The name of the CF.

**Explanation:** This message indicates that the `tpf_lemic`

function returned a non-zero return code.

**System Action:** The TPF system is forced into uniprocessor mode.

**User Response:** Do the following:

1. Review the return code on the LEMIC macro.
2. Correct the error indicated by the return code.

See the *TPF C/C++ Language Support User's Guide* for more information about the `tpf_lemic` function. See *TPF System Macros* for more information about the LEMIC macro.

---

**CFLK0208E** *segment* **– RETURN CODE** *retcode* **FROM LEMIC MONITOR OPERATION CONNECTION ATTEMPT FAILED TO COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*retcode*
The return code.

*cfname*
The name of the CF.

**Explanation:** This message indicates that the `tpf_lemic` function returned a non-zero return code.

**System Action:** The TPF system is forced into uniprocessor mode.

**User Response:** Do the following:

1. Review the return code on the LEMIC macro.
2. Correct the error indicated by the return code.

See the *TPF C/C++ Language Support User's Guide* for more information about the `tpf_lemic` function. See *TPF System Macros* for more information about the LEMIC macro.

---

**CFLK0209W** *segment* **– RUNNING IN FORCED UNIPROCESOR MODE**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** Coupling facility (CF) locking restart was not successful on the first processor. Therefore, the TPF system prevents other processors from joining the processor configuration.

**System Action:** None.

**User Response:** Do the following:

1. See any preceding error messages for detailed information about this error.
2. Correct the error.
3. Perform an initial program load (IPL) of the TPF system.

---

**CFLK0211E** *segment* **– COUPLING FACILITIES ARE REQUIRED FOR LOCKING – NO COUPLING FACILITIES FOUND OR CONNECTED – CORRECT OR REMOVE FAILING COUPLING FACILITIES**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** One of the following errors occurred:

- No coupling facilities (CFs) were added to the processor configuration. CFs are required for locking.
- No successful CF connections were made during CF locking restart. CFs are required for locking.

**System Action:** Forced uniprocessor mode is set in CF locking restart.

**User Response:** Do one of the following:

- If no CFs were added to the processor configuration:
  1. Enter the ZMCFT ADD command to add any CFs that are available to a processor configuration.
  2. Enter the ZCFLK ADD command to add each CF to the CF locking configuration.
  3. Perform an initial program load (IPL) of the TPF system.
- If no successful CF connections were made during CF locking restart:
  1. Enter the ZCFLK MIGRATE command to change the lock residency of the modules from CFs to concurrency filter lock facility (CFLF ) locking control units (CUs).
  2. Enter the ZCFLK DELETE command to remove the failing CFs from the locking configuration.
  3. IPL the TPF system.
- Continue running in forced uniprocessor mode.

If none of the previous actions correct the error, see your IBM service representative.

See *TPF Operations* for more information about the ZMCFT ADD, ZCFLK ADD, and ZCFLK MIGRATE commands.

---

**CFLK0212E** **CFL5 – RETURN CODE** *retcode* **FROM LEMIC LOCATEMOD OPERATION FOR SDA** *sda*

**Where:**

*retcode*
The `tpf_lemic` return code.

*sda* The symbolic device address (SDA).

**Explanation:** The coupling facility (CF) lock distribution algorithm (LDA) called the `tpf_lemic` function to determine the CF index of a general data set (GDS). The return code reference in the message indicates the error that occurred.

**System Action:** The CF residency for the module is left unchanged. The LDA routine continues with the next device.

**User Response:** See the *TPF C/C++ Language Support User's Guide* for more information about the `tpf_lemic` function and how to correct this error.

**CFL20001W LOCK TABLE FULL ON CF – *cfname***

**Where:**

*cfname*
The name of the coupling facility (CF).

**Explanation:** The CF attached has no lock space available.

**System Action:** None.

**User Response:** Do the following:

1. Review the current lock space size.
2. Make any needed modifications.

# CGTB–CJIW

**CGTB0001E LNIATA NOT IN WGTA**

**Explanation:** The 6-character line number, interchange address, and terminal address (LNIATA) was not found in the WGTA table for the CPU ID specified on the ZDWTG command.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct CPU ID or LNIATA to specify.
2. Enter the ZDWGT command again and specify the correct CPU ID or LNIATA.

See *TPF Operations* for more information about the ZDWGT command.

**CGTB0002I**

**Explanation:** This is the normal response to the ZDWGT command with the ENTRY parameter specified. This message is followed by a display of information from the WGTA table entry matching the line number, interchange address, and terminal address (LNIATA) and CPU ID specified on the ZDWGT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDWGT command and for an example of the informational display.

**CGTB0003E PARAMETER INCORRECT**

**Explanation:** The format of the ZDWGT command is not correct because one of the following errors occurred:

- Characters that are not hexadecimal were specified
- The value specified for the LNIATA is not a 6-digit hexadecimal number.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZDWGT command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZDWGT command.

**CGT00002I WGTA CORE COPY REUSED**

**Explanation:** The core copy of the WGTA was valid across the software IPL and was reused.

**System Action:** None.

**User Response:** None.

**CGT10011I WGTA TABLES INITIALIZED**

**Explanation:** The core copy of the WGTA has been rebuilt from the UAT records.

**System Action:** None.

**User Response:** None.

**CGT10012E UAT FACE ERROR**

**Explanation:** This message is followed by the 00047A system error. See *Messages (System Error and Offline)* for a description of this error.

**System Action:** None.

**User Response:** None.

**CGT10013E UAT READ I/O ERROR**

**Explanation:** A hardware error was found while reading the UAT(UA1UA) records from file.

**System Action:** WGTA initialization is unable to continue and the restart process is ended.

**User Response:** Determine whether this is a hardware problem and then correct it.

**CGT10014E UAT RECORD ID/CODE CHECK FAILURE**

**Explanation:** This message is followed by the 00047A system error. See *Messages (System Error and Offline)* for a description of this error.

**System Action:** None.

**User Response:** None.

**CGT10015E WGTA TABLE TOO SMALL, CHANGE AND REIPL**

**Explanation:** This message is followed by the 00047A system error. See *Messages (System Error and Offline)* for a description of this error.

**System Action:** None.

**User Response:** None.

**CGT10016I WGTA TABLE INITIALIZATION STARTED**

**Explanation:** The core copy of the WGTA is being rebuilt from the UAT records.

**System Action:** None.

**User Response:** None.

**CGT20021I WGTA RECORDS WRITTEN TO FILE**

**Explanation:** The main storage copy of the WGTA was written to file.

**System Action:** None.

**User Response:** None.

**CGT20022E FACE ERROR ON WGTA RECORD**

**Explanation:** This message is followed by the 00047A system error. See *Messages (System Error and Offline)* for a description of this error.

**System Action:** None.

**User Response:** None.

**CGT20023E ERROR ON FILING WGTA RECORD**

**Explanation:** A hardware error was found while writing the WGTA from main storage to file.

**System Action:** WGTA write processing is ended. The WGTA indicator is set on in keypoint C and system restart is continued.

**User Response:** Determine whether this is a hardware problem and correct it.

**CGT30031I HASH TABLE DISTRIBUTION**

**Explanation:** This message is output after WGTA initialization completes.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDWGT command for a full description of this message.

**CGT40001E UNABLE TO PROCESS – KEYPOINT C RETRIEVAL ERROR**

**Explanation:** An error occurred while retrieving keypoint C.

**System Action:** None.

**User Response:** Verify that keypoint C is loaded into the TPF system.

See *TPF Operations* for more information about the ZDWGT command.

**CGT40002E INVALID NUMERIC FIELD**

**Explanation:** The parameter specified in the ZDWGT command is not valid.

**System Action:** None.

**User Response:** Enter the ZDWGT command again and specify a valid parameter.

See *TPF Operations* for more information about the ZDWGT command.

**CGT40003E INVALID REQUEST**

**Explanation:** The parameter specified with the command is not correct.

**System Action:** None.

**User Response:** Enter the ZDWGT command again by using the correct format.

See *TPF Operations* for more information about the ZDWGT command.

**CGT40004E HASH VALUE MUST BE ODD ... RE-ENTER REQUEST**

**Explanation:** An error was found because the hash value must be ODD.

**System Action:** None.

**User Response:** Enter the command again and specify a hash value of ODD.

See *TPF Operations* for more information about the ZDWGT command.

**CGT40005E WGTA VALUE MUST BE 2 OR MORE**

**Explanation:** An error occurred because the WGTA value must be two or more and it is not.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDWGT command.

**CGT40006E REQUEST REJECTED — NOT VALID ON GENERAL FILE**

**Explanation:** The request is rejected because it is not valid for a general file.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information in the ZDWGT command.

**CGT40007I REQUEST COMPLETE**

**Explanation:** This is the normal response to the ZDWGT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDWGT command.

**CGT40099I NUMBER OF HASH TABLE ENTRIES** *mmmmmm* **NUMBER OF WGTA TABLE ENTRIES** *nnnnnn*

**Where:**

*mmmmmm*
The number of hash table entries.

*nnnnnn*
The number of WGTA table entries.

**Explanation:** This is the normal response to the ZDWGT command. This message displays the number of entries in the hash and WGTA tables.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDWGT command.

---

**CGT50052I RETRIEVAL ERROR ON KEYPOINTED WGTA — ALL RIDS LOST**

**Explanation:** During the WGTA build process, the nonzero resource identifier (RID) values are copied from the keypointed old WGTA to the newly-built WGTA. A file address compute program (FACE) or FIND error occurred on a WGTA record, which aborted this RID copy process.

**System Action:** The following occurs:

- No nonzero RID values are copied into the newly-built WGTA
- The copy process is aborted
- The WGTA build process is continued.

**User Response:** None.

---

**CGT50053W *nnnnnn* PSEUDO LNIATA(s) NOT FOUND IN THE WGTA**

**Where:**

*nnnnnn*
A number indicating how many pseudo line number, interchange address, and terminal address (LNIATA) that are defined in the resource vector table (RVT) are not in the WGTA.

**Explanation:** During WGTA initialization, when the WGTA slot is retrieved and updated for each pseudo LNIATA found in the RVT, it is detected that some pseudo LNIATAs are not found in the WGTA.

**System Action:** A SNAPC dump is issued with the 02A system error number. This dump contains a list of the RVT LNIATAs that are not found in the WGTA. Up to 1000 LNIATAs are recorded in the dump. However, the count field in the message may indicate that more mismatches exist.

After the SNAPC is issued, processing is continued.

**User Response:** Review the system error dump and verify the validity of the pseudo LNIATAs that are flagged.

If they are valid, add them to the UAT and initialize the WGTA again.

If they are not valid, correct the RVT information, run OSTG again, and IPL the TPF system again.

---

**CGT80001I WGTA RELOADED FROM FILE**

**Explanation:** The main storage copy of the WGTA was loaded from file.

**System Action:** None.

**User Response:** None.

---

**CGT80003E WGTA READ I/O ERROR**

**Explanation:** An input/output (I/O) error condition is found while retrieving a WGTA record from file into core.

**System Action:** The WGTA main storage area is cleared and the restart is continued by initializing the WGTA again from the UAT(UA1UA) records.

**User Response:** None.

---

**CHEB0001I ACTIVE CONVERSATIONS — *nnnnnn***

**Where:**

*nnnnnn*
The number of active conversations in the TPF system.

**Explanation:** During TPF system restart, this message is displayed to show the number of active conversations in the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

---

**CHKB0001I SCB1 BUILT AND FILED**

**Explanation:** During a fresh load of the SNA tables, this message is displayed after the session control block part 1 (SCB1) table is built and filed.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

---

**CHKB0002I SCB2 BUILT AND FILED**

**Explanation:** During a fresh load of the SNA tables, this message is displayed after the session control block part 2 (SCB2) table is built and filed.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

---

**CHKC0001I CCB BUILT AND FILED**

**Explanation:** During a fresh load of the SNA tables, this message is displayed after the conversation control block (CCB) table is built and filed.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

---

**CHKD0001I CCB CORE COPY REUSED**

**Explanation:** During a non-fresh load of the SNA tables, the core copy of the conversation control block (CCB) table is valid and will be used again.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

**CHKD0002I CCB RELOADED FROM FILE**

**Explanation:** During a non-fresh load of the SNA tables, the conversation control block (CCB) table was loaded again from file.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

**CHKR0001I SCB1 CORE COPY REUSED**

**Explanation:** During a non-fresh load of the SNA tables, the core copy of the session control block part 1 (SCB1) table is valid and will be used again.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

**CHKR0002I SCB1 RELOADED FROM FILE**

**Explanation:** During a non-fresh load of the SNA tables, the session control block part 1 (SCB1) table was loaded again from file.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

**CHKR0003I SCB2 CORE COPY REUSED**

**Explanation:** During a non-fresh load of the SNA tables, the core copy of the session control block part 2 (SCB2) table is valid and will be used again.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

**CHKR0004I SCB2 RELOADED FROM FILE**

**Explanation:** During a non-fresh load of the SNA tables, the session control block part 2 (SCB2) table was loaded again from file.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

**CHIO0001E**

**Explanation:** Refer to the CSIO line error messages for any message with a CHIO header.

**System Action:** None.

**User Response:** None.

**CHKT0001I TPICB TABLE BUILT**

**Explanation:** During SNA restart, this message displays when the transaction program instance control block (TPICB) table was built.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

**CHNX0001I CNOS** *verb* **RECEIVED, MODENAME –** *modename*, **REMOTE LU –** *rluname*, **LOCAL LU –** *luname*, **SESSION LIMIT –** *totsess*, **MIN CONWINER –** *yyyyyyy*, **MIN CONLOSER –** *xxxxxx*

**Where:**

*verb*
The change number of sessions (CNOS) verb.

*modename*
The mode name.

*rluname*
The remote logical unit (LU) name.

*luname*
The local LU.

*totsess*
The session limit.

*yyyyyyy*
The MIN CONWINER.

*xxxxxx*
The MIN CONLOSER.

**Explanation:** A change number of sessions (CNOS) INITIALIZE, CHANGE, or RESET request for a logical unit (LU) and mode name pair was received from a remote LU.

**System Action:** The new session limits are displayed for an initialize or change request. The session limit is set to 0 for a reset request.

**User Response:** None.

**CIJH0001E CIJH ERROR DURING LOAD — INSUFFICIENT SPACE IN GL2**

**Explanation:** There is insufficient space in GL2.

**System Action:** The restart procedure is continued.

**User Response:** None.

---

**CIJH0002E CIJH ERROR – INSUFFICIENT SLOTS ALLOCATED IN GLOBY**

**Explanation:** There are insufficient slots allocated in GLOBY.

**System Action:** The restart procedure is continued.

**User Response:** None.

---

**CIJH0003E CIJH ERROR FINDING RECORD WITH PROGRAM NAME *progname* FILE ADDRESS *address***

**Where:**

*progname*
The program name.

*address*
The file address.

**Explanation:** None.

**System Action:** The restart procedure is continued.

**User Response:** None.

---

**CIJH0004I CIJH LOAD SUCCESSFUL**

**Explanation:** After the message is issued, control is returned to the TPF system restart program.

**System Action:** The system action is identical for all errors found during CIJH processing.

**User Response:** None.

---

**CIJH0005E CIJH ERROR — RECORD *rrrr* HAS AN INVALID LENGTH COUNT**

**Where:**

*rrrr* The record.

**Explanation:** None.

**System Action:** The restart procedure is continues.

**User Response:** None.

---

**CIJS0001I CCP TRACE STARTED**

**Explanation:** This message is used when the input command was accepted without error.

**System Action:** None.

**User Response:** None.

See *TPF Non-SNA Data Communications Reference* for more information about the communications control program trace (CCTRUG).

---

**CIJS0002E INVALID SYMBOLIC LINE NUMBER — CCP TRACE NOT STARTED**

**Explanation:** The input command was rejected because of a symbolic line number that is not valid or a symbolic line number range that is not valid for the line type specified.

**System Action:** None.

**User Response:** None.

See *TPF Non-SNA Data Communications Reference* for more information about the communications control program trace (CCTRUG).

---

**CIJS0003I CCP TRACE STOPPED**

**Explanation:** The input ZLTRF command was accepted and the communications control program (CCP) was deactivated successfully.

**System Action:** None.

**User Response:** None.

See *TPF Non-SNA Data Communications Reference* for more information about the communications control program trace (CCTRUG). See *TPF Operations* for more information about the ZLTRF command.

---

**CIJS0004E ZLTRF REJECTED — CCP TRACE NOT ACTIVE**

**Explanation:** The input ZLTRF command was rejected because the communications control program (CCP) was not active.

**System Action:** None.

**User Response:** None.

See *TPF Non-SNA Data Communications Reference* for more information about the communications control program trace (CCTRUG). See *TPF Operations* for more information about the ZLTRF command.

---

**CIJS0005E INVALID OPTION — *xxx* NOT ON LINE 00 OR 01**

**Where:**

*xxx* PRC or RO

**Explanation:** The PRC option was specified when the PRC was not on line 01 or the RO option was specified when the RO was not on line 00 or 01.

**System Action:** The communications control program (CCP) trace is not started.

**User Response:** None.

See *TPF Non-SNA Data Communications Reference* for more information about the communications control program trace (CCTRUG).

---

**CILC0101E UNABLE TO INITIALIZE MASTER XPRG RECORD**

**Explanation:** A detailed message of why the master XPRG was unable to be initialized precedes this message.

**System Action:** The load ends abnormally.

**User Response:** Do the following:

1. See the preceding message for details about the problem.
2. Correct the problem.
3. Load the program again.

**CILC0119W UNABLE TO INITIALIZE MASTER APRG RECORD**

**Explanation:** A detailed message of why the master APRG record was unable to be initialized precedes this message.

**System Action:** The online loader load function ends abnormally.

**User Response:** Do the following:

1. See the preceding message for information about the problem.
2. Correct the problem.
3. Load any programs containing ADATA files again.

See *TPF System Installation Support Reference* for more information about the online loader functions.

**CILD0104E LIBRARY *cccc* CANNOT BE LOADED TO NON-BSS SUBSYSTEM.**

**Where:**

*cccc*
The name of the library.

**Explanation:** There was a request to load library *cccc* to a non-BSS subsystem. Libraries are only allowed in the BSS subsystem.

**System Action:** The library specified in the message was not loaded.

**User Response:** Load the library in the BSS subsystem.

**CILD0105E UNABLE TO DETERMINE CURRENT PROGRAM TYPE FOR PROGRAM *cccc* - PROGRAM NOT LOADED**

**Where:**

*cccc*
The name of the C load module.

**Explanation:** An error occurred while obtaining the #PVR records to determine the program type of the existing version of the C load module.

**System Action:** The load ends abnormally.

**User Response:** See the preceding message for details about the cause of the problem.

**CILD0106E UNABLE TO FIND PROGRAM *cccc* ONLINE**

**Where:**

*cccc*
The name of the program.

**Explanation:** Unable to find the existing copy of the #PROGn record for the program being loaded.

**System Action:** The program will not be loaded. The load continues.

**User Response:** Verify that the program is allocated.

**CILE0102E NO MORE EXTRA PROGRAM RECORDS AVAILABLE**

**Explanation:** There are no more extra program records #XPRGn available in the TPF system.

**System Action:** The load continues.

**User Response:** Do one of the following:

- Try to recover any lost #XPRGn records by:
  1. Clearing the program module base for the image, which is done by including a LOADER PROG-MOD-BASE CLEAR card in either an auxiliary load deck or a general file loader load deck.
  2. Loading all the C load modules again.
- If there are not enough #XPRGn records, load a new FACE table with additional ordinals defined.

**CILE0103W THE NUMBER OF EXTRA PROGRAM RECORDS AVAILABLE IS *nnnn* AND BELOW THE THRESHOLD VALUE OF *nnnn***

**Where:**

*nnnn*
A decimal value.

**Explanation:** The number of available extra program records (#XPRGn) is now below the threshold value.

**System Action:** The auxiliary loader load function or E-type loader accept function continues.

**User Response:** Do one of the following:

- Try to recover any lost #XPRGn records by:
  1. Clearing the program module base for the image, which is done by including a LOADER PROG-MOD-BASE CLEAR card in either an auxiliary load deck or a general file loader load deck.
  2. Loading again all the programs that are C load modules.
- If there are not enough #XPRGn records, load a new FACE table with additional ordinals defined.

**CILE0115W NUMBER OF ADATA RECORDS AVAILABLE IS *recnum* AND BELOW THE THRESHOLD VALUE OF *threshold***

**Where:**

*recnum*
The number of available #APRG*n* records at the time the condition occurred.

*threshold*
The threshold value, which is a percentage of the total number of #APRG*n* records allocated and is used solely for the purpose of identifying when the number of available records is low so the condition can be reported.

**Explanation:** The number of available #APRG*n* records has fallen below the threshold value.

**System Action:** The load process continues. ADATA files will continue to be loaded until there are not enough files available to load a single ADATA file. At that time, message LDRM0114W will be displayed.

**User Response:** If necessary, allocate additional #APRG*n* records.

See *TPF System Installation Support Reference* for more information about the online loader functions. See *TPF System Generation* for more information about changing record allocations.

---

**CILF0107E UNABLE TO FIND TEXT/ACRL RECORD FOR MODULE *cccc* ONLINE**

**Where:**

*cccc*
The name of the program module.

**Explanation:** Either the online auxiliary loader or the E-type loader accept function was unable to find a text or ADCON relocation record (ACRL) for the specified program module. A detailed message of why the loader was unable to find this record precedes this message.

**System Action:** The online auxiliary loader load function or E-type loader accept function ends abnormally. If the E-type loader accept function was processing, the E-type loader policing routine tries again to accept the loadset.

**User Response:** See the preceding message for more information.

---

**CILF0108E UNABLE TO FIND ORDINAL RECORD FOR MODULE *cccc* ONLINE**

**Where:**

*cccc*
The name of the program module.

**Explanation:** The online auxiliary loader or the E-type loader accept function issued a find of the ordinal record for the program module specified in the message but was unable to do the find.

**System Action:** The online auxiliary loader load function or E-type loader accept function ends abnormally. If the E-type loader accept function was processing, the E-type loader policing routine tries again to accept the loadset.

**User Response:** See the previous message for details about why the loader was unable to do the find.

---

**CILF0109W MODULE *cccc* IS SKIPPED**

**Where:**

*cccc*
The name of the program module.

**Explanation:** The online loader tried to obtain a new record for the requested module, but failed.

**System Action:** The load of this module is skipped. The load process continues.

**User Response:** See the preceding message for more information.

---

**CILF0110E UNABLE TO UPDATE PRIMARY ORDINAL RECORD FOR MODULE *cccc***

**Where:**

*cccc*
The name of the program module.

**Explanation:** The total number of ordinals required for this program needs to change because of one of the following:

- An online auxiliary load of the C load module was done.
- An E-type loader accept of the C load module was done.

However, the loader was unable to update the primary ordinal with the correct number.

**System Action:** The online auxiliary load or E-type loader accept function ends abnormally. If the E-type loader accept function was processing, the E-type loader policing routine tries again to accept the loadset.

**User Response:** Do the following:

1. See the preceding message for details about why the loader was not able to find the record.
2. Correct the error.
3. Load the program module again if an auxiliary load was being performed.

---

**CILF0111E REQUEST ABORTED - INVALID RECORD ID *xx* FOUND IN INPUT FILE**

**Where:**

*xx* A hexadecimal value.

**Explanation:** While processing an E-type program or program load module, an unexpected record was read from the input medium.

**System Action:** The TPF system ends the online loader load function.

**User Response:** Do the following:

1. Run the offline load again.
2. Load the program again.

---

**CILF0112E ERROR READING FROM DDNAME *xxxxxxxxxxxxxxx***

**Where:**

*xxxxxxxxxxxxxxx*
The name of the input device.

**Explanation:** The record read from the specified DDNAME was not in the expected format. The TPF system expected one of the program records.

**System Action:** The TPF system ends the online loader load function.

**User Response:** Do the following:

1. Run the offline load again.
2. Load the program again.

See *TPF System Installation Support Reference* for more information about the online loader functions and the offline job routine.

**CILG0111E REQUEST ABORTED - INVALID RECORD ID *xx* FOUND IN INPUT FILE**

**Where:**

*xx* A hexadecimal value.

**Explanation:** While processing an E-type program or program load module, an unexpected record was read from the input medium.

**System Action:** The online loader load function ends abnormally.

**User Response:** Do the following:

1. Run the offline load program again.
2. Run the online load program again.

See *TPF System Installation Support Reference* for more information about the online and offline loader functions.

**CILG0112E ERROR READING FROM DDNAME *input***

**Where:**

*input*
The name of the input device.

**Explanation:** The record that was read from the specified data definition name was not in the expected format. The TPF system expected one of the program records.

**System Action:** The online loader load function ends abnormally.

**User Response:** Do the following:

1. Run the offline load program again.
2. Run the online load program again.

See *TPF System Installation Support Reference* for more information about the online and offline loader functions.

**CILH0111E REQUEST ABORTED - INVALID RECORD ID *xx* FOUND IN DDNAME *xxxxxxxxxxxxxxx***

**Where:**

*xx* A hexadecimal value.

*xxxxxxxxxxxxxxx*
The name of the input device.

**Explanation:** While processing an E-type program or program load module, an unexpected record was read from the input medium.

**System Action:** The TPF system ends the online loader load function.

**User Response:** Do the following:

1. Run the offline load again.
2. Load the program again.

**CILH0112E ERROR READING FROM DDNAME *xxxxxxxxxxxxxxx***

**Where:**

*xxxxxxxxxxxxxxx*
The name of the input device.

**Explanation:** The record read from the specified DDNAME was not in the expected format. The TPF system was expecting one of the program records.

**System Action:** The TPF system ends the online loader load function.

**User Response:** Do the following:

1. Run the offline load again.
2. Load the program again.

See *TPF System Installation Support Reference* for more information about the online loader functions and the offline job routine.

**CILO0113E UNABLE TO FIND ADATA ORDINAL RECORD FOR MODULE *nnnn* ONLINE**

**Where:**

*nnnn*
The name of the program being loaded at the time of the error.

**Explanation:** An error occurred while trying to read an existing ADATA file for the specified program.

**System Action:** The load process continues; however, the ADATA file for the specified program will not be loaded.

**User Response:** Do one of the following:

- If the ADATA file is not required for the specified program, do nothing.
- If the ADATA file is required, do one of the following:
  - Load the specified program again with the ADATA file by using the E-type loader (OLDR).
  - Determine the cause of the error by examining existing program and ADATA records and correct the problem. See your system programmer for help with these data structures.
  - Load the specified program again and include the LOADER APRG CLEAR card in the load deck. This causes all ADATA files to be erased, so all programs with ADATA files will need to be reloaded. If a failure still occurs, an I/O error needs to be corrected.

See *TPF System Installation Support Reference* for more information about the online loader functions.

**CILO0114W NO MORE ADATA RECORDS AVAILABLE - ADATA FILES WILL NOT BE LOADED FOR ALL PROGRAMS**

**Explanation:** The loader attempted to load one or more ADATA files for a real-time program and determined that there were not enough #APRG*n* records available.

**System Action:** The load process continues; however, the loader does not attempt to load ADATA files for any real-time programs after the error occurred.

**User Response:** To load real-time programs with ADATA files after this error occurs, do one of the following:

- Allocate additional #APRG*n* records and load programs with ADATA files again by using the auxiliary loader.
- Load the programs containing ADATA files by using the E-type loader (OLDR).

See *TPF System Installation Support Reference* for more information about the online loader functions. See *TPF System Generation* for more information about changing record allocations.

---

**CILO0117W ERROR READING BASE ADATA RECORD FOR PROGRAM *nnnn* - ADATA NOT LOADED**

**Where:**

*nnnn*
The name of the program being loaded at the time of the error.

**Explanation:** The loader attempted to load a real-time program with an ADATA file, but an error occurred while trying to read an existing ADATA record for the specified program.

**System Action:** The load process continues; however, the ADATA file for the specified program will not be loaded.

**User Response:** Do one of the following:

- If the ADATA file is not required for the specified program, do nothing.
- If the ADATA file is required, do one of the following:
  - Load the specified program again with the ADATA file by using the E-type loader (OLDR).
  - Determine the cause of the error by examining existing program and ADATA records and correcting the problem. See your system programmer for help with these data structures.
  - Load the specified program again and include the LOADER APRG CLEAR card in the load deck. This causes all ADATA files to be erased, so all programs with ADATA files will need to be reloaded after doing this. If a failure still occurs, an I/O error needs to be corrected.

See *TPF System Installation Support Reference* for more information about the online loader functions.

---

**CILO0118W UNABLE TO UPDATE PRIMARY ADATA ORDINAL RECORD FOR MODULE *nnnn***

**Where:**

*nnnn*
The name of the program being loaded at the time of the error.

**Explanation:** The loader attempted to load a real-time program with an ADATA file, but an error occurred while trying to write to the ADATA ordinal record for the specified program.

**System Action:** The load process continues; however, the ADATA file for the specified program will not be loaded.

**User Response:** Do one of the following:

- If the ADATA file is not required for the specified program, do nothing.
- If the ADATA file is required, do one of the following:
  - Load the specified program again with the ADATA file by using the E-type loader (OLDR).
  - Determine the cause of the error by examining existing program and ADATA records and correcting the problem. See your system programmer for help with these data structures.
  - Load the specified program again and include the LOADER APRG CLEAR card in the load deck. This causes all ADATA files to be erased, so all programs with ADATA files will need to be reloaded. If a failure still occurs, an I/O error needs to be corrected.

See *TPF System Installation Support Reference* for more information about the online loader functions.

---

**CILO0120E UNABLE TO FIND ADATA RECORD FOR MODULE *nnnn* ONLINE**

**Where:**

*nnnn*
The name of the program being loaded at the time of the error.

**Explanation:** An error occurred while trying to find an #APRG*n* record that is needed to write the ADATA file for the program being loaded.

**System Action:** The load process continues; however, the ADATA file for the specified program will not be loaded.

**User Response:** Do one of the following:

- If the ADATA file is not required for the specified program, do nothing.
- If ADATA file is required, do one of the following:
  - Load the specified program again with the ADATA file by using the E-type loader.
  - Determine the cause of the error by examining existing program and ADATA records and correcting the problem. See your system programmer for help with these data structures.

See *TPF System Installation Support Reference* for more information about the online loader functions.

---

**CILX0116W ERROR READING PVR RECORD FOR PROGRAM *nnnn* - ADATA NOT LOADED**

**Where:**

*nnnn*
The name of the program being loaded at the time of the error.

**Explanation:** The loader attempted to load a real-time program with an ADATA file, but an error occurred while trying to read the #PVR*n* record containing the program version record (PVR) entry for the specified program.

**System Action:** The load process continues; however, the ADATA file for the specified program will not be loaded.

**User Response:** Determine the cause of the error by examining the #PVR*n* records.

See *TPF System Installation Support Reference* for more information about the online loader functions.

---

**CILX0117W ERROR READING BASE ADATA RECORD FOR PROGRAM *nnnn* - ADATA NOT LOADED**

**Where:**

*nnnn*
The name of the program being loaded at the time of the error.

**Explanation:** The loader attempted to load a real-time program with an ADATA file, but an error occurred while trying to read an existing ADATA record for the specified program.

**System Action:** The load process continues; however, the ADATA file for the specified program will not be loaded.

**User Response:** Do one of the following:

- If the ADATA file is not required for the specified program, do nothing.
- If the ADATA file is required, do one of the following:
  - Load the specified program again with the ADATA file by using the E-type loader (OLDR).
  - Determine the cause of the error by examining existing program and ADATA records and correcting the problem. See your system programmer for help with these data structures.
  - Load the specified program again and include the LOADER APRG CLEAR card in the load deck. This causes all ADATA files to be erased, so all programs with ADATA files will need to be reloaded. If a failure still occurs, an I/O error needs to be corrected.

See *TPF System Installation Support Reference* for more information about the online loader functions.

---

**CIL60111E REQUEST ABORTED - INVALID RECORD ID *xx* FOUND IN DDNAME *xxxxxxxxxxxxxxxx***

**Where:**

*xx* A hexadecimal value.

*xxxxxxxxxxxxxxxx*
The name of the input device.

**Explanation:** While processing an E-type program or program load module, an unexpected record was read from the input medium.

**System Action:** The TPF system ends the online loader load function.

**User Response:** Do the following:

1. Run the offline load again.
2. Load the program again.

---

**CIL60121W UNABLE TO UPDATE PVR RECORD FOR PROGRAM *nnnn* - ADATA MAY NOT BE USABLE**

**Where:**

*nnnn*
The name of the program being loaded at the time of the error.

**Explanation:** An error occurred while trying to update the program version record (PVR) entry in the #PVR*n* record, which indicates whether an ADATA file was loaded for the specified program.

**System Action:** The load process continues; however, the ADATA file for the specified program will not be loaded.

**User Response:** Do one of the following:

- If the ADATA file is not required for the specified program, do nothing.
- If the ADATA file is required, do one of the following:
  - Load the specified program again with the ADATA file by using the E-type loader (OLDR).
  - Determine the cause of the error by examining existing program and ADATA records and correcting the problem. See your system programmer for help with these data structures.

See *TPF System Installation Support Reference* for more information about the online loader functions.

---

**CINP0001E**

**Explanation:** Refer to the CSIO line error messages for any message with a CINP header.

**System Action:** None.

**User Response:** None.

---

**CJ040001I TO2 RESTARTED**

**Explanation:** This is the normal response during a TPF system IPL when TPF collection support has been initialized.

**System Action:** None.

**User Response:** None.

---

**CJ040002I TO2 NOT INITIALIZED, TO2 RESTART BYPASSED**

**Explanation:** TPF collection support was not restarted during a TPF system IPL because it was never initialized.

**System Action:** TPF collection support restart is bypassed and the TPFCS database remains unavailable.

**User Response:** Enter the ZOODB INIT command to access the TPFCS database.

---

**CJ040003I TO2 CYCLED UP**

**Explanation:** This is the normal response during a system cycle up to NORM state from TPF collection support (TPFCS).

**System Action:** None.

**User Response:** None.

---

**CJ040004I TO2 NOT INITIALIZED, TO2 CYCLE BYPASSED**

**Explanation:** TPF collection support (TPFCS) could not be cycled because it has not been initialized or the TPFCS anchor and shadow records have been corrupted.

**System Action:** TPFCS cycle processing is bypassed. TPFCS remains unavailable for application use.

**User Response:** Do one of the following:

- If TPFCS has been initialized, use a captured copy of the TPFCS anchor or shadow record to restore TPFCS.
- If TPFCS has not been initialized, ignore the message.

---

**CJ040005I TO2 CYCLED DOWN**

**Explanation:** This is the normal response during a system cycle down from NORM state from TPF collection support (TPFCS).

**System Action:** None.

**User Response:** None.

---

**CJ040051E ERROR ON TO2 RESTART**

**Explanation:** TPF collection support could not be initialized during a TPF systemIPL because an internal logic error occurred.

**System Action:** TPF collection support initialization is not completed successfully and the TPFCS database remains unavailable.

**User Response:** See your IBM service representative.

---

**CJ040052E ERROR ON TO2 CYCLE UP**

**Explanation:** TPF collection support (TPFCS) was not cycled because of an internal error.

**System Action:** TPFCS cycle processing ends. TPFCS is available for application use.

**User Response:** See your IBM service representative.

---

**CJ040099E TO2 INTERNAL ERROR, ERROR CODE** *errcode errtext*

**Where:**

*errcode*
The internal error code.

*errtext*
The text describing the error.

**Explanation:** An internal error occurred during a TPF system IPL.

**System Action:** TPF collection support initialization is not completed successfully and the TPFCS database remains unavailable.

**User Response:** See your IBM service representative.

---

**CJ160001E TO2 FUNCTIONAL MESSAGE IS NOT VALID**

**Explanation:** A ZRECP TO2 command was entered with an incorrect parameter or incorrect syntax.

**System Action:** The command is rejected.

**User Response:** Do the following:

- Determine the correct syntax for the command.
- Enter the command again.

---

**CJIW0002I I/O COMPLETION FOR** *xxxx* **IS LATE, NO RECOVERY REQUESTED.**

**Where:**

*xxxx*
The device address.

**Explanation:** The input/output (I/O) request was not completed within a fixed time period. The I/O is allowed to continue with the time period reset. The current fixed period of time is 5 seconds.

**System Action:** None.

**User Response:** None.

---

**CJIW0003I DEVICE RESET AND QUEUE RESTARTED AFTER TIME OUT FOR** *xxxx*

**Where:**

*xxxx*
The device address.

**Explanation:** The input/output (I/O) request was not completed within a fixed amount of time.

**System Action:** The I/O request is halted and restarted with a new time period.

**User Response:** None.

---

**CJIW0006W CHPID** *id* **REMOVED FROM DEVICE** *ccud* **DUE TO PERMANENT ERROR**

**Where:**

*id* The channel path identifier.

*ccud*
The device address.

**Explanation:** The channel path indicated in the message is receiving device errors that do not occur on the device's other paths.

**System Action:** The channel path is removed from the path mask associated with the device and is no longer used for input/output (I/O) operations to the device.

**User Response:** This is a hardware error. See your IBM service representative.

---

**CJIW0007W CHPID *id* REMOVED FROM DEVICE *ccud* PATH INOPERATIVE**

**Where:**

*id* The channel path identifier.

*ccud*
The device address.

**Explanation:** The channel path indicated in the message was found to be inoperative when accessed.

**System Action:** The channel path is removed from the path mask associated with the device and is no longer used for input/output (I/O) operations to the device.

**User Response:** This is probably an interface switch that was not turned on. Otherwise this is considered a hardware error. See your IBM service representative.

**CJIW0008W CHPID *id* REMOVED FROM DEVICE *ccud* CC-3 ON PATH**

**Where:**

*id* The channel path identifier.

*ccud*
The device address.

**Explanation:** The channel path indicated in the message returned a CC-3 when the TPF system attempted to use it to access the device.

**System Action:** The channel path is removed from the path mask associated with the device and is no longer used for input/output (I/O) operations to the device.

**User Response:** This is probably an interface switch that was not turned on. Otherwise this is considered a hardware error. See your IBM service representative.

# CLAW–CLGX

**CLAW0001I CLAW DEVICE TABLE INITIALIZED AND FILED**

**Explanation:** This message displays the first time the TPF system is IPLed with TCP/IP offload support.

This message can also occur when the Common Link Access to Workstations (CLAW) device table must be initialized as a result of an error while attempting to convert from #IBMM4 to #IBMMP4 fixed records.

**System Action:** None.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP offload support.

**CLAW0002E OPEN ADAPTER ERROR–*xxxx* ON CLAW DEVICE–*workstation***

**Where:**

*xxxx*
The error return code.

*workstation*
The name of the workstation.

**Explanation:** An error occurred while trying to activate a workstation by using the ZCLAW ACTIVATE command. The `claw_openadapter`function was unable to initialize an adapter for Common Link Access to Workstation (CLAW)communications.

**System Action:** The command is rejected.

**User Response:** Enter the ZCLAW ACTIVATE command again.

See *TPF Operations* for more information about the ZCLAW ACTIVATE command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the `claw_openadapter` function.

**CLAW0003I CDT LOAD PROCESSING COMPLETED**

**Explanation:** This message displays when the TPF system is IPLed, the Common Link Access to Workstation (CLAW) device table (CDT) has been initialized, and the definitions for the CLAW devices are loaded from file.

**System Action:** None.

**User Response:** None.

**CLAW0004E DUPLICATE ENTRY ALREADY EXISTS IN CLAW DEVICE TABLE**

**Explanation:** An error occurred when entering the ZCLAW ADD command. A duplicate entry exists in the Common Link Access to Workstation (CLAW) device table (CDT).

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW ADD command.

**CLAW0005E SDA ENTERED WAS NOT AN EVEN NUMBERED SDA**

**Explanation:** An error occurred when entering a ZCLAW command with a value for the symbolic device address (SDA) that is not valid. The value of the SDA for a read channel connecting a workstation to the TPF systemmust be represented by an even number.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Ensure that all SDA values are represented as even numbers.
2. Enter the ZCLAW command again and specify a value for the SDA that is valid.

See *TPF Operations* for more information about the ZCLAW commands.

### CLAW0006E SDA ENTERED ALREADY ASSOCIATED WITH ANOTHER WORKSTATION

**Explanation:** An error occurred when entering the ZCLAW ADD command. The symbolic device address (SDA) value specified on the SDA parameter is assigned to another workstation. Each workstation must have a unique SDA value.

**System Action:** The command is rejected.

**User Response:** Enter the ZCLAW ADD command again and specify an SDA value that is unique to this workstation.

See *TPF Operations* for more information about the ZCLAW ADD command.

### CLAW0007E CLAW DEVICE TABLE IS FULL – UNABLE TO ADD REQUEST

**Explanation:** An error occurred when entering the ZCLAW ADD command because the Common Link Access to Workstation (CLAW) device table (CDT) is full.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Increase the value of the CLAWADP parameter in the SNAKEY macro.
2. Reassemble keypoint record 2 (CTK2) against the SNAKEY macro.
3. Reload CTK2.
4. IPL the TPF system again.

See *TPF Operations* for more information about the ZCLAW ADD command. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

### CLAW0008I ENTRY SUCCESSFULLY ADDED TO CLAW DEVICE TABLE

**Explanation:** This is the normal response to the ZCLAW ADD command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW ADD command.

### CLAW0009E INCORRECT NUMBER OF PARAMETERS SPECIFIED FOR ZCLAW

**Explanation:** The format of a ZCLAW command is not correct.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZCLAW command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZCLAW commands.

### CLAW0010I CLAW DEVICE DISPLAY STARTED

**Explanation:** This is the normal response to the ZCLAW DISPLAY command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW DISPLAY command and for an example of the informational display.

### CLAW0011I CLAW DEVICE STATUS STARTED

**Explanation:** This is the normal response to the ZCLAW STATUS command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW STATUS command and for an example of the informational display.

### CLAW0013I CLAW DEVICE INACT STARTED

**Explanation:** This is the normal response to the ZCLAW INACTIVATE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW INACTIVATE command and for an example of the informational display.

### CLAW0014E SDA–*sda* NOT FOUND IN CDT

**Where:**

*sda* The symbolic device address (SDA) of the read channel for the workstation.

**Explanation:** An error occurred when entering the ZCLAW ACTIVATE or ZCLAW INACTIVATE command. The SDA value specified on the command was not found in the Common Link Access to Workstation (CLAW) device table (CDT).

**System Action:** The command is rejected.

**User Response:** Enter the ZCLAW ACTIVATE or the ZCLAW INACTIVATE command again and specify the correct SDA value.

See *TPF Operations* for more information about the ZCLAW ACTIVATE and ZCLAW INACTIVATE commands.

### CLAW0015E WORKSTATION–*workstation* NOT FOUND IN CDT

**Where:**

*workstation*
The name of the workstation.

**Explanation:** An error occurred when entering the ZCLAW ACTIVATE or ZCLAW INACTIVATE command. The workstation name specified on the command was not found in

the Common Link Access to Workstation (CLAW) device table (CDT).

**System Action:** The command is rejected.

**User Response:** Enter the ZCLAW ACTIVATE or the ZCLAW INACTIVATE command again and specify the correct workstation name.

See *TPF Operations* for more information about the ZCLAW ACTIVATE and the ZCLAW INACTIVATE commands.

---

**CLAW0018E WORKSTATION–*workstation* ALREADY ACTIVE**

**Where:**

*workstation*
The name of the workstation.

**Explanation:** An error occurred when entering the ZCLAW ACTIVATE command with the WS parameter specified. The workstation name specified is already active.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct workstation name on the ZCLAW ACTIVATE command, the workstation is active already and there is no more action for you to take.
- If you specified an incorrect workstation name on the ZCLAW ACTIVATE command, enter the command again and specify the correct workstation name.

See *TPF Operations* for more information about the ZCLAW ACTIVATE command.

---

**CLAW0019E WORKSTATION–*workstation* ALREADY INACTIVE**

**Where:**

*workstation*
The name of the workstation.

**Explanation:** An error occurred when entering the ZCLAW INACTIVATE command with the WS parameter specified. The workstation name specified is already inactive.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct workstation name on the ZCLAW INACTIVATE command, the workstation is inactive already and there is no more action for you to take.
- If you specified an incorrect workstation name on the ZCLAW INACTIVATE command, enter the command again and specify the correct workstation name.

See *TPF Operations* for more information about the ZCLAW INACTIVATE command.

---

**CLAW0020E CLOSE ADAPTER ERROR *code* ON CLAW DEVICE *workstation***

**Where:**

*code*
The CLAW_CLOSEADAPTER function error return code.

*workstation*
The name of the workstation.

**Explanation:** An error occurred when CLA2, the CLAW disconnect entry point (EP), received a disconnect request from a CLAW workstation and then tried to issue a CLAW_CLOSEADAPTER function for the workstation. The function returned an error code indicating it was unable to complete the close adapter processing for the workstation.

**System Action:** None.

**User Response:** None.

---

**CLAW0021E SDA–*sda* ALREADY INACTIVE**

**Where:**

*sda* The symbolic device address (SDA) of the read channel for the workstation.

**Explanation:** An error occurred when entering the ZCLAW INACTIVATE command with the SDA parameter specified. The SDA specified is already inactive.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct SDA on the ZCLAW INACTIVATE command, the workstation is inactive already and there is no more action for you to take.
- If you specified an incorrect SDA on the ZCLAW INACTIVATE command, enter the command again and specify the correct SDA.

See *TPF Operations* for more information about the ZCLAW INACTIVATE command.

---

**CLAW0022I NO ACTIVE WORKSTATIONS IN CDT**

**Explanation:** An error occurred when entering the ZCLAW DISPLAY command with the ACTIVE parameter specified. There are currently no active workstations in the Common Link Access to Workstation (CLAW) device table (CDT)to display.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW DISPLAY command.

---

**CLAW0023I NO WORKSTATIONS IN CDT TO DISPLAY**

**Explanation:** An error occurred when entering the ZCLAW DISPLAY command with the ALL parameter specified. There are currently no workstations defined in the Common Link Access to Workstation (CLAW) device table (CDT).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW DISPLAY command.

---

**CLAW0024E LOGICAL LINK–*xx* IS OUT OF RANGE OF 0 TO 31**

**Where:**

*xx* The logical link (LL) address.

**Explanation:** An error occurred when the ZCLAW STATUS command with the LL parameter specified was entered. The logical link value specified for the LL parameter is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZCLAW STATUS command again and specify a valid logical link value.

See *TPF Operations* for more information about the ZCLAW STATUS command.

**CLAW0026I ZCLAW DEVICE DELETE STARTED**

**Explanation:** This is the normal response to the ZCLAW DELETE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW DELETE command and for an example of the informational display.

**CLAW0027E WORKSTATION–*workstation* STILL ACTIVE**

**Where:**

*workstation*
The name of the workstation.

**Explanation:** The ZCLAW DELETE command was entered and an error occurred while trying to delete a Common Link Access to Workstation (CLAW)device with active connections.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZCLAW INACTIVATE command to deactivate the active connections.
2. Enter the ZCLAW DELETE command again to delete the CLAW device.

See *TPF Operations* for more information about the ZCLAW DELETE and ZCLAW INACTIVATE commands.

**CLAW0028E SDA–*sda* NOT FOUND IN CDT**

**Where:**

*sda* The symbolic device address (SDA) of the read channel for the workstation.

**Explanation:** An error occurred when entering the ZCLAW DELETE command. The SDA specified on the command was not found in the Common Link Access to Workstation (CLAW) device table (CDT).

**System Action:** The command is rejected.

**User Response:** Enter the ZCLAW DELETE command again and specify the correct SDA.

See *TPF Operations* for more information about the ZCLAW DELETE command.

**CLAW0029E SDA–*sda* STILL ACTIVE**

**Where:**

*sda* The symbolic device address (SDA) of the read channel for the workstation.

**Explanation:** The ZCLAW DELETE command was entered and an error occurred while trying to delete a Common Link Access to Workstation (CLAW)device at the SDA specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZCLAW INACTIVATE command to deactivate the active connections.
2. Enter the ZCLAW DELETE command again to delete the CLAW device at the SDA specified.

See *TPF Operations* for more information about the ZCLAW INACTIVATE and ZCLAW DELETE commands.

**CLAW0030E ZCLAW PROCESSING STILL ACTIVE FOR A PREVIOUS MESSAGE**

**Explanation:** An error occurred because a ZCLAW command was entered before the previous command completed processing.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait for the first ZCLAW command to complete processing.
2. Enter the ZCLAW command again.

See *TPF Operations* for more information about the ZCLAW commands.

**CLAW0033E SYSTEM MUST BE IN 1052 OR ABOVE FOR THIS ZCLAW COMMAND**

**Explanation:** This error occurs when trying to enter certain ZCLAW commands while the TPF system is restarting.

**System Action:** None.

**User Response:** Enter the ZCLAW command again when the TPF systemis in 1052 state.

See *TPF Operations* for more information about the ZCLAW commands.

**CLAW0035I NO ACTIVE WORKSTATIONS FOUND IN CDT**

**Explanation:** An error occurred when the ZCLAW STATUS command with the ALL parameter specified was entered. There were no active workstations found in the Common Link Access to Workstation (CLAW) device table (CDT).

**System Action:** The ZCLAW STATUS command was rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW STATUS command.

---

**CLAW0036E SDA–*sda* ALREADY ACTIVE**

**Where:**

*sda* The symbolic device address (SDA) of the read channel for the workstation.

**Explanation:** An error occurred when entering the ZCLAW ACTIVATE command with the SDA parameter specified.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct SDA or workstation name on the ZCLAW ACTIVATE command, the workstation is active already and there is no more action for you to take.
- If you specified an incorrect SDA or workstation name on the ZCLAW ACTIVATE command, enter the command again and specify the correct SDA or workstation name.

See *TPF Operations* for more information about the ZCLAW ACTIVATE command.

---

**CLAW0037I CLAW DEVICE ACTIVATION STARTED**

**Explanation:** This is the normal response to the ZCLAW ACTIVATE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW ACTIVATE command and for an example of the informational display.

---

**CLAW0038E LOCATE ERROR ON THE CDT HEADER ADDRESS**

**Explanation:** An error occurred because the Common Link Access to Workstation (CLAW) device table (CDT) address was not accessible.

**System Action:** The command is rejected.

**User Response:** Have your system programmer determine the cause of the problem and correct the error.

See *TPF Operations* for more information about the ZCLAW commands.

---

**CLAW0039E INVALID RECORD ID USED TO RETRIEVE CDT FROM FILE**

**Explanation:** An error occurred because a record ID that is not valid was used to retrieve the Common Link Access to Workstation (CLAW) device table (CDT) from storage.

**System Action:** None.

**User Response:** Have your system programmer determine the cause of the problem and correct the error.

---

**CLAW0040E INVALID ORDINAL NUMBER USED TO RETRIEVE CDT FROM FILE**

**Explanation:** An error occurred because an ordinal number that is not valid was used to retrieve the Common Link Access to Workstation (CLAW) device table (CDT) from storage.

**System Action:** None.

**User Response:** Have your system programmer determine the cause of the problem and correct the error.

---

**CLAW0041E UNRECOVERABLE ERROR ATTEMPTING TO FILE CDT**

**Explanation:** An error occurred in response to a ZCLAW command when trying to file the Common Link Access to Workstation (CLAW) device table (CDT) to storage.

**System Action:** None.

**User Response:** Have your system programmer determine the cause of the problem and correct the error.

See *TPF Operations* for more information about the ZCLAW commands.

---

**CLAW0042E INVALID RECORD ID USED TO FILE CDT**

**Explanation:** An error occurred in response to a ZCLAW command because a record ID that is not valid was used to file the Common Link Access to Workstation (CLAW) device table (CDT) to storage.

**System Action:** None.

**User Response:** Have your system programmer determine the cause of the problem and correct the error.

See *TPF Operations* for more information about the ZCLAW commands.

---

**CLAW0043E INVALID ORDINAL NUMBER USED TO FILE CDT**

**Explanation:** An error occurred in response to a ZCLAW command while trying to file the Common Link Access to Workstation (CLAW) device table (CDT) to storage. The ordinal number used is not in the range allowed for the #IBMM4 record type.

**System Action:** None.

**User Response:** Have your system programmer determine the cause of the problem and correct the error.

See *TPF Operations* for more information about the ZCLAW commands.

---

**CLAW0044I HOSTNAME SET AND SAVED IN CDT**

**Explanation:** This is the normal response to the ZCLAW ADD command with the HOSTNAME parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW ADD command and for an example of the informational display.

**CLAW0045E ERROR IN CLAW CONNECT, RC–*rc* ADAPTER ID–*id* SDA–*sda***

**Where:**

*rc* The return code from the `claw_connect` function.

*id* The address of the adapter block.

*sda* The symbolic device address (SDA) of the read channel for the workstation.

**Explanation:** An error occurred attempting a request to open a logical link (LL) on an active Common Link Access to Workstation (CLAW) adapter by using the `claw_connect` function. This can occur in response to a ZCLAW ACTIVATE or ZCYCL command.

**System Action:** An error return code is returned on the `claw_connect`function.

**User Response:** Do the following:

1. Review the return code to determine the problem.
2. Correct the error.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the `claw_connect` function. See *TPF Operations* for more information about the ZCLAW and ZCYCL commands.

**CLAW0046I TPF HOSTNAME IS *hostname***

**Where:**

*hostname*
The name of the TPF host.

**Explanation:** This is the normal response to the ZCLAW DISPLAY command with the HOSTNAME parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW DISPLAY command.

**CLAW0047I ZCLAW RESET PROCESSING COMPLETED**

**Explanation:** This is the normal response to the ZCLAW RESET command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW RESET command.

**CLAW0048E STATUS INFORMATION NOT AVAILABLE ON CLAW DEVICE *wsname***

**Where:**

*wsname*
The name of the workstation.

**Explanation:** An error occurred when entering the ZCLAW STATUS command. There is no status available for the Common Link Access to Workstation (CLAW) device.

**System Action:** The ZCLAW STATUS command was rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW STATUS command.

**CLAW0049E UNRECOVERABLE ERROR ATTEMPTING TO FIND CDT**

**Explanation:** A FINDC error occurred while trying to retrieve the CLAW device table (CDT) from file. Because the CDT was not loaded from file there were no CLAW workstation defined to the TPF system.

**System Action:** None.

**User Response:** Do the following:

1. Have your system programmer determine the source of the FINDC error.
2. Enter the ZCLAW ADD command again to define the CLAW workstation if necessary.

See *TPF Operations* for more information about the ZCLAW ADD command.

**CLAW0054I FILE COPY CONVERSION OF CLAW DEVICE TABLE SUCCESSFUL**

**Explanation:** The Common Link Access to Workstation (CLAW) device table was successfully converted from #IBMM4 records to #IBMMP4 records.

**System Action:** TPF system restart continues.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the CLAW device table (CDT).

**CLAW0055I FILE COPY CONVERSION OF CLAW DEVICE TABLE NOT SUCCESSFUL**

**Explanation:** The Common Link Access to Workstation (CLAW) device table was not successfully converted from #IBMM4 records to #IBMMP4 records.

**System Action:** TPF system restart continues.

**User Response:** Do the following:

1. Determine why the FILNC function failed for the IBMMP4 record and correct the problem.
2. Restart the TPF system.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the CLAW device table (CDT).

**CLAW0066W CLAW TRACE WILL BE STOPPED BECAUSE OF SHORTAGE OF 4K FRAMES**

**Explanation:** An error occurred while the Common Link Access to Workstation (CLAW) trace was writing to tape because the TPF system fell below the minimum number of 4 KB frames available.

**System Action:** The TPF system stops writing the CLAW trace to tape.

**User Response:** Do the following:

1. Determine which resource is consuming the 4 KB frames.
2. Correct the error.

---

**CLAW0067E ERROR OCCURRED WHEN WRITING CLAW TRACE BLOCK TO TAPE**

**Explanation:** An error occurred while writing a Common Link Access to Workstation (CLAW) trace block to tape.

**System Action:** None.

**User Response:** Have your system programmer determine the cause of the problem and correct the error.

---

**CLAW0071E FAILURE OCCURRED AT CLAW DEVICE *sda***

**Where:**

*sda* Symbolic device address (SDA) of the read channel for the workstation.

**Explanation:** This error occurs when the workstation sends a fail message to the TPF system.

**System Action:** The TPF system cleans up the entries for that workstation in the Common Link Access to Workstation (CLAW) device table (CDT).

**User Response:** Do the following:

1. Review the connection between the TPF system and the workstation or the workstation itself to determine the problem.
2. Correct the problem.

---

**CLAW0072E CLAW DEVICE *sda* DISCONNECTED**

**Where:**

*sda* Symbolic device address (SDA) of the read channel for the workstation.

**Explanation:** One of the following occurred:

- The ZCLAW INACTIVATE command was entered.
- The TPF system was cycled down to 1052 state while a TCP/IP offload device was connected to the TPF system.
- The TPF system received a disconnect from the TCP/IP offload device.

**System Action:** The TPF system cleans up the entries for this workstation in the Common Link Access to Workstation (CLAW) device table (CDT).

**User Response:** Do one of the following:

- If you entered the ZCLAW INACTIVATE command or the TPF system was being cycled down to 1052 state, there is no further action for you to take.
- If the TPF system received a disconnect from the TCP/IP offload device, verify that the offload application is running and restart the application if necessary.

See *TPF Operations* for more information about the ZCLAW INACTIVATE command.

---

**CLAW0073I CLAW DEVICE *sda* CONNECTION REJECTED**

**Where:**

*sda* Symbolic device address (SDA) of the read channel for the workstation.

**Explanation:** The connection request was rejected from the TCP/IP offload device.

**System Action:** None.

**User Response:** None.

---

**CLAW0074I CLAW DEVICE *sda* CONNECTED**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** One of the following occurred:

- The connection request was received from the TCP/IP offload device.
- A connection request from the TPF system was accepted by the TCP/IP offload device.

**System Action:** None.

**User Response:** None.

---

**CLAW0082I ZCLAW TAPE TRACE INTERNALLY INACTIVATED**

**Explanation:** An error occurs when the Common Link Access to Workstation (CLAW) trace is writing to tape and the TPF system falls below the shutdown level associated with the IBMHI priority class for entry control blocks (ECBs), 4 KB frames, or system work blocks (SWBs).

**System Action:** The TPF system stops writing CLAW trace to tape.

**User Response:** Do the following:

1. Enter the ZSYSL command with the ALTER, CLASS, and IBMHI parameters specified to decrease the shutdown level for 4 KB frames, ECBs, or SWBs for the IBMHI priority class.
2. Enter the ZCLAW TRACE command with the START and TAPE parameters specified to enable CLAW trace data to be written to tape.

See *TPF Operations* for more information about the ZSYSL and ZCLAW TRACE commands.

---

**CLAW0083E TAPE LOGGING ALREADY ACTIVE**

**Explanation:** An error occurred when entering the ZCLAW TRACE command with the START TAPE parameter specified. Tape logging is already active.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW TRACE command.

---

**CLAW0084I ZCLAW TRACE STARTED ON TAPE**

**Explanation:** This is the normal response to the ZCLAW TRACE command with the START parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW TRACE command.

**CLAW0085E ZCLAW TRACE ALREADY ACTIVE**

**Explanation:** An error occurred when entering the ZCLAW TRACE command with the START ALL parameter specified. Tracing on all workstations is already active.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW TRACE command.

**CLAW0086I ZCLAW TRACE ALL WORKSTATIONS STARTED**

**Explanation:** This is the normal response to the ZCLAW TRACE command with the START ALL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW TRACE command.

**CLAW0088E INVALID WORKSTATION NAME LENGTH**

**Explanation:** An error occurred when entering a ZCLAW command with the WS parameter specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZCLAW command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about ZCLAW commands.

**CLAW0089I ZCLAW TRACE STARTED ON WORKSTATION** *workstation*

**Where:**

*workstation*
The name of the workstation.

**Explanation:** This is the normal response to the ZCLAW TRACE command with the START WS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW TRACE command.

**CLAW0090E WORKSTATION NAME NOT IN CDT**

**Explanation:** An error occurred when entering the ZCLAW TRACE command with the START WS parameter specified. The workstation name specified was not found in the Common Link Access to Workstation (CLAW) device table (CDT).

**System Action:** The command is rejected.

**User Response:** Enter the ZCLAW TRACE command again and specify a valid workstation name.

See *TPF Operations* for more information about the ZCLAW TRACE command.

**CLAW0091E INVALID ZCLAW TRACE START INPUT**

**Explanation:** The format of the ZCLAW TRACE command is not correct.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZCLAW TRACE command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZCLAW TRACE command.

**CLAW0092I ZCLAW TRACE TAPE STOPPED**

**Explanation:** This is the normal response to the ZCLAW TRACE command with the STOP parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW TRACE command.

**CLAW0093E TAPE LOGGING NOT ACTIVE**

**Explanation:** An error occurred when entering the ZCLAW TRACE command with the STOP TAPE parameter specified. Tape logging is already stopped.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW TRACE command.

**CLAW0094I ZCLAW TRACE STOPPED**

**Explanation:** This is the normal response to the ZCLAW TRACE command with the STOP ALL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW TRACE command.

**CLAW0095E INVALID ZCLAW TRACE STOP INPUT**

**Explanation:** The format of the ZCLAW TRACE command is not correct.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZCLAW TRACE command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZCLAW TRACE command.

**CLAW0096E ZCLAW TRACE NOT ACTIVE**

**Explanation:** An error occurred when entering the ZCLAW TRACE command with the STOP parameter specified. Tracing on all workstations is already inactive.

**System Action:** The ZCLAW TRACE command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW TRACE command.

**CLAW0097I ZCLAW TRACE STATUS DISPLAY**

**Explanation:** This is the normal response to the ZCLAW TRACE command with the STATUS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW TRACE command and for an example of the informational display.

**CLAW0098I ZCLAW TRACE STATUS – TRACE NOT ACTIVE**

**Explanation:** An error occurred when entering the ZCLAW TRACE command with the STATUS parameter specified because trace is not active.

**System Action:** The ZCLAW TRACE command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZCLAW TRACE command.

**CLAW0099E INVALID TRACE INPUT**

**Explanation:** The format of the ZCLAW TRACE command is not valid.

**System Action:** The ZCLAW TRACE command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZCLAW TRACE command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZCLAW TRACE command.

**CLC00001I SOCKET/CLAW TABLE INITIALIZATION.....COMPLETE**

**Explanation:** All socket and Common Link Access to Workstation (CLAW) internal tables were initialized during TPF system restart.

**System Action:** None.

**User Response:** None.

**CLCA0001E STORAGE FOR TCP/IP NETSTAT TABLE NOT OBTAINED**

**Explanation:** An error occurred because heap storage for the Transmission Control Protocol/Internet Protocol(TCP/IP) NETSTAT table was not obtained during TPF systemcycle-up.

**System Action:** The TCP/IP NETSTAT table is not initialized.

**User Response:** Enter the ZCTKA ALTER command with the SSPS parameter specified to increase the amount of heap storage in the TPF system.

See *TPF Operations* for more information about the ZCTKA ALTER command.

**CLGX0001E UNABLE TO PROCESS – LIST FULL**

**Explanation:** This is the normal response to the ZAUTH command with the ALTER parameter specified. An error occurred while trying to add a new entry to the terminal application authorization table but the table is full.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command with the ALTER parameter specified.

**CLGX0005E INVALID LIT ADDRESS**

**Explanation:** This is the normal response to the ZAUTH command. This error occurred because the line number, interchange address, and terminal address (LNIATA)is not known or is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

**CLGX0006E INVALID MESSAGE FORMAT**

**Explanation:** This is the normal response to the ZAUTH command. This error occurred because a parameter was specified that is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

### CLGX0007E TAOPP INITIALIZATION COMPLETE

**Explanation:** This is the normal response to the ZAUTH command with the INIT parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command with the INIT parameter specified.

### CLGX0008E INVALID APPLICATION

**Explanation:** This is the normal response to the LOGI command. This error occurred because the application program is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the LOGI command.

### CLGX0010E NOT LOGGED TO APPLICATION

**Explanation:** This is the normal response to the LOGU command. An error occurred while requesting unsolicited messages because you are not logged to an application program. You must be logged to an application program before entering the LOGU command to request unsolicited messages.

**System Action:** None.

**User Response:** Do the following:

1. Be sure you are logged to an application program.
2. Enter the LOGU command again to request the unsolicited messages.

See *TPF Operations* for more information about the LOGU command.

### CLGX0011E FACE OR FIND ERR ON TAOPP

**Explanation:** This is the normal response to the ZAUTH command. During internal processing an error occurred while trying to find the entry in the terminal authorization application table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

### CLGX0012E INVLD – TERMINAL DEFINED AS FSC

**Explanation:** This is the normal response to the LOGO command. You cannot enter the LOGO command to a terminal that is currently logged on as a console.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the LOGO command.

### CLGX0013E ZAUTH INVALID FOR THIS DEVICE

**Explanation:** This is the normal response to the ZAUTH command. This error occurred because you tried to enter the ZAUTH command on a console that is not supported.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

### CLGX0017E INVALID DEVICE TYPE

**Explanation:** This is the normal response to the LOGI command. This error occurred because the console device type is not supported.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the LOGI command.

### CLGX0018E TERMINAL RECORD IN ERROR

**Explanation:** This is the normal response to the LOGI or LOGO commands. An internal error occurred while trying to retrieve the node control block (NCB) for the console.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the LOGI or LOGO commands.

### CLGX0019E SUBSYSTEM ID/APPL NAME INVALID

**Explanation:** This error occurred while trying to log into an application program on a subsystem that is not known.

**System Action:** None.

**User Response:** None.

### CLGX0020E INVALID – SUBSYSTEM INACTIVE

**Explanation:** This error occurred while trying to log into an application program on a subsystem that is not active.

**System Action:** None.

**User Response:** None.

### CLGX0021E SUBSYSTEM INACTIVE

**Explanation:** This error occurred while trying to log into an application program on a subsystem that is not active.

**System Action:** None.

**User Response:** None.

**CLGX0023E INVALID LIT LENGTH**

**Explanation:** This is the normal response to the ZAUTH command. This error occurred because the line number, interchange address, and terminal address (LNIATA)specified contained something other than 6 characters.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

**CLGX0024E DELETE ABORTED – LIST EMPTY**

**Explanation:** This is the normal response to the ZAUTH DELETE command. This error occurred because the terminal authorization application table is already empty.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command with the DELETE parameter specified.

**CLGX0025E APPL NAME LENGTH EXCEEDED**

**Explanation:** This is the normal response to the ZAUTH command. This error occurred because the application program name specified is too long.

**System Action:** None.

**User Response:** Enter the ZAUTH command again and specify an application program name that is not too long.

See *TPF Operations* for more information about the ZAUTH command.

**CLGX0026E APPL NOT IN TAOPP LIST**

**Explanation:** This is the normal response to the ZAUTH command. This error occurred because the application program name was not found in the terminal authorization application table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

**CLGX0027E FACE OR FIND ERR ON UA1UA**

**Where:**

*xxxx*
The name of the agent assembly area (AAA) initialization table (UAT).

**Explanation:** This is the normal response to the ZAUTH command. A retrieval error occurred on the agent assembly area (AAA) initialization table (UAT) referenced in the message while trying to get the file address.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

**CLGX0028E UA1UA REC NOT FOUND FOR TERM**

**Explanation:** This is the normal response to the ZAUTH command. A retrieval error occurred while retrieving the file address.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

**CLGX0029E WGTA RETRIEVAL ERROR**

**Explanation:** This is the normal response to a LOGI or LOGO command. An error occurred while retrieving the WGTA entry for the console.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the LOGI or LOGO commands.

**CLGX0030E INVLD LIT/RID CONVERSION ERROR**

**Explanation:** This is the normal response to a LOGI or LOGO command. An error occurred while converting the logical endpoint identifier (LEID) to a resource identifier (RID).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the LOGI or LOGO commands.

# CLKS

**CLKS0001I SYSTEM CLOCK IS NOW SET**

**Explanation:** The TPF system clock was initialized based on an operational time-of-day (TOD) clock.

**System Action:** The restart procedure continues with an operational TOD clock.

**User Response:** None.

See *TPF Operations* for more information about the ZATIM command.

**CLKS0003W CTKI RETRIEVAL ERROR**

**Explanation:** Keypoint I (CTKI) could not be retrieved from disk during time-of-day (TOD) clock synchronization. Consequently, the number of leap seconds could not be moved into low core for this CPC.

If there is a nonzero value for the number of leap seconds in CTKI, Greenwich Mean Time (GMT) and local standard time calculations are off by the number of leap seconds because CTKI was not retrieved. (A nonzero value for the number of leap seconds in CTKI indicates that the TOD clock is using absolute time.)

**System Action:** The TOD clock synchronization process is continued.

**User Response:** Do the following:

1. Determine why CTKI could not be retrieved from disk.
2. Correct the retrieval problem.
3. Resynchronize the CPC by entering the ZACOR command to correct the value of the number of leap seconds in low core.

   If a Sysplex Timer (STR) is available, determine the correct number of leap seconds from the STR device panel that displays offsets.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

---

**CLKS0005W WAITING FOR CPC CLOCK CONFIRMATION**

**Explanation:** The CPC is waiting for confirmation of its time with an external source. This message indicates that the time is required to complete validation of the current clock setting.

**System Action:** None.

**User Response:** If this is a loosely coupled TPF system and other confirmed CPCs are available, the time will be confirmed with the other confirmed CPCs. If not, you must confirm the time by entering a ZATIM command.

To reset the clock:

1. Enter the ZDTIM SYS command to get the current time in the hh.mm format for use in step 2.
2. Do one of the following:
   - Enter the ZATIM HHMM TOD HHMMSS MMDDYY command to alter the time-of-day (TOD) clock.
   - Enter the ZATIM HHMM TOD STR command to use the time from a Sysplex Timer (STR).

If the TOD Clock Override facility is not present, the ATIM51A PRESS 'TOD ENABLE SET' KEY TO SYNC CPC TOD CLOCKS message is issued.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0010I TIME OF DAY CLOCK LOCAL STANDARD TIME TIME:** *hh.mm.ss* **DATE:** *mm/dd/yy*

**Where:**

*hh.mm.ss*
The hour, minute, and second.

*mm/dd/yy*
The month, day, and year.

**Explanation:** The current value of the time-of-day (TOD) clock. This message is displayed when the TOD clock is being validated during restart and after it is confirmed with an external time source.

Part of the time value (*hhmm*) may be used as the baseline value for resetting the time (by entering the ZATIM command).

**System Action:** None.

**User Response:** This is purely an information message. No response is required. If the time or date is incorrect, it may be modified by entering the ZATIM command.

See *TPF Operations* for more information about the ZATIM and ZDTIM commands.

---

**CLKS0011A THE BSS WILL CHANGE DATE WHEN CYCLED UP TO CONTINUE OR TO CANCEL THE CYCLE UP — ENTER A ZATME or ZCYCL COMMAND**

**Explanation:** Entering the ZCYCL command to cycle the basic subsystem (BSS) above 1052 state involves testing the midnight boundary.

**System Action:** This message is sent to the operator if the BSS will cross a midnight boundary since the last time it was above 1052 state.

**User Response:** Do one of the following:

- Enter the ZATME GOOD command, which allows the BSS to cycle up with the new date.
- Enter the ZATIM SET command followed by the ZATME GOOD command, which allows the BSS time to be altered while maintaining the old date before continuing.
- Enter the ZATME CNCL command, which cancels the cycle request.

See *TPF Operations* for more information about the ZATME and ZCYCL commands.

---

**CLKS0012A SUBSYSTEM** *ssname* **WILL CHANGE DATE WHEN CYCLED UP TO CONTINUE OR TO CANCEL THE CYCLE UP – ENTER A ZATME COMMAND**

**Where:**

*ssname*
The subsystem name.

**Explanation:** Entering the ZCYCL command to cycle a subsystem above 1052 state results in testing the midnight boundary.

**System Action:** This message is sent to the operator if the subsystem crosses the midnight boundary since the last time it was above 1052 state.

**User Response:** Do one of the following:

- Enter the ZATME GOOD command, which allows the subsystem to cycle up with the new date.
- Enter the ZATIM SET command followed by the ZATME GOOD command, which allows the subsystem time to be altered while maintaining the old date before continuing.
- Enter the ZATME CNCL command, which cancels the cycle request.

See *TPF Operations* for more information about the ZATME and ZCYCL commands.

---

**CLKS0012I TOD CLOCK** *stat*

**Where:**

*stat* One of the following:
- NOT SET
- IN ERROR
- NOT-OP.

**Explanation:** While trying to convert the time-of-day value for the CLKS0010I message, a store clock instruction has indicated that the TOD clock is in one of the previously listed states.

In the case of the IN ERROR display, this indicates a malfunctioning clock hardware error.

In the case of the NOT SET display the clock was simply not previously set. This is the case after a power on/reset, for example.

**System Action:** None.

**User Response:** If the TOD clock is able to be set after this message is displayed, then any error condition was transient.

If not, the TOD clock has a hardware error and have system programmer check the problem.

See *TPF Operations* for more information about the ZDTIM command.

---

**CLKS0013I THE BSS WILL CONTINUE TO CYCLE UP**

**Explanation:** This is the normal response to the ZATME GOOD command when it is entered in response to the CLKS0011A message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZATME and ZCYCL commands.

---

**CLKS0014I SUBSYSTEM** *ssname* **WILL CONTINUE TO CYCLE UP**

**Where:**

*ssname*
The subsystem name.

**Explanation:** This is the normal response to the ZATME GOOD command when it is entered in response to the CLKS0012A message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZATME and ZCYCL commands.

---

**CLKS0015I THE BSS CYCLE UP REQUEST CANCELLED**

**Explanation:** This is the normal response to the ZATME CNC command when it is entered in response to the CLKS0011A message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZATME and ZCYCL commands.

---

**CLKS0016I SUBSYSTEM** *ssname* **CYCLE UP REQUEST CANCELLED**

**Where:**

*ssname*
The subsystem name.

**Explanation:** This is the normal response to the ZATME CNCL command when it is entered in response to the CLKS0012A message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZATME and ZCYCL commands.

---

**CLKS0018I STR TIME OF DAY LOCAL STANDARD TIME TIME:** *hh.mm.ss* **DATE:** *mm/dd/yy*

**Where:**

*hh.mm.ss*
The hour, minute, and second.

*mm/dd/yy*
The month, day, and year.

**Explanation:** This is the current time-of-day (TOD) value from the Sysplex Timer (STR).

If the time or date is incorrect, it can be modified on the STR.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTIM command.

---

**CLKS0021W CONFLICTING ZATIM REQUESTS FOR SUBSYSTEM** *xxx* **VALIDATE THE SUBSYSTEM TIME ON ALL PROCESSORS. IF ANY IS INCORRECT — ENTER A SINGLE ZATIM COMMAND**

**Where:**

*xxx* The subsystem name.

**Explanation:** One of the following errors occurred:
- There were conflicting alterations of the subsystem clocks made on more than one processor
- The subsystem clocks were altered a second time on one processor prior to all processors synchronizing to the first alter time request.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZATME, ZCYCL, and ZATIM commands. See *TPF Main Supervisor*

*Reference* for more information about clocks.

---

**CLKS0023I SUBSTITUTE SSR USED** *xx*

**Where:**

*xx* The synchronous selection register (SSR).

**Explanation:** When a CPC is not found in keypoint I during restart, a substitute synchronous selection register (SSR) is created using the processor number. This allows more flexibility in the restart process.

**Note:** The substitute SSR must not be used to establish synchronization with the time-of-day (TOD) RPQ. Doing so will result in irrecoverable synchronization errors.

**System Action:** None.

**User Response:** This is an informational message so no response is required.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0026I ZATIM, ENTERED ON CPU ID** *cpu id*, **HAS RESET TOD CLOCK —STARTING TOD RESYNCH**

**Where:**

*cpu id*
The central processing unit (CPU) ID.

**Explanation:** In a loosely coupled complex, allowing the CPC to alter the time-of-day (TOD) clocks is called the Master CPC. The Master CPC is originally the first processor IPLed in the loosely coupled complex.

The designation Master may be shifted to another CPC by altering the time on that CPC with the bypass option. Any CPCs in 1052 state at that time will have their TOD clocks reset to the new time automatically. Any CPCs not in 1052 state will be informed that to become synchronous with the loosely coupled complex a ZRIPL command must be entered or the non-synchronous CPC must be cycled to 1052 and the time reset. Refer to the CLKS56E message.

**System Action:** None.

**User Response:** Do one of the following:

- If the CPC is in 1052 state, you do not need to do anything. The resynchronization proceeds automatically.
- If the CPC is above 1052 state, enter the ZRIPL command to become synchronous with the loosely coupledcomplex or cycle to 1052 state and reset the time.

See *TPF Operations* about the ZATIM command.

---

**CLKS0027I TOD CLOCK TIME RESET**

**Explanation:** When the time-of-day (TOD) clock was reset on another CPC, this CPC was found to be in 1052 state. Consequently, the TOD clocks on this CPC could be reset automatically.

This message is displayed when the reset process is complete.

**System Action:** The TOD clocks will be synchronous with the Master of the loosely coupled complex.

**User Response:** This is an information message. When this message is displayed, CPC TOD resynchronization is complete.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0043W INVALID IPC MESSAGE TYPE RECEIVED**

**Explanation:** During the resynchronization of a loosely coupled CPC another loosely coupledCPC responded with a Interprocessor Communications (IPC) facility message that is not valid.

**System Action:** The message is rejected and another CPC is addressed with a status request.

**User Response:** None.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0044W STATUS REQUEST RECEIVED FROM INACTIVE CPUID** *id*

**Where:**

*id* The central processing unit (CPU) ID.

**Explanation:** A request for time-of-day (TOD) clock status was received from a loosely coupled processor marked as inactive in Keypoint I.

**System Action:** None.

**User Response:** Determine whether the CPU specified is actually inactive.

If the CPU is not inactive, Keypoint I has an error that must be corrected.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0045W INVALID IPC MESSAGE NUMBER RECEIVED**

**Explanation:** During the resynchronization of a loosely coupled CPC another loosely coupledCPC responded with a zero Interprocessor Communications (IPC) facility message.

**System Action:** The message is rejected and another CPC is addressed with a status request.

**User Response:** None.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0046I CPC CLOCK(S) LOCALLY SYNCHRONOUS**

**Explanation:** This message occurs when:

- A synchronization check error is found but the processor time-of-day (TOD) clocks in error are revalidated successfully. This means that the CPC is internally synchronous. It is not synchronized with a loosely coupled complex but it continues to be locally synchronous.
- A TOD set request on another processor finds this processor in NORM state with internally synchronous clocks. If the

clocks are not internally synchronous, the processor is taken down and an irrecoverable system error (SE 67B) is issued.

- A ZATIM request fails to synchronize the CPC to an attached Sysplex Timer (STR). This means that the CPC is internally synchronous. It is not synchronized with a loosely coupled complex but it continues to be locally synchronous.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** If the processor is to be confirmed with a remote time source, you can re-IPL or enter the ZATIM command. Otherwise, no other action is required.

See *TPF Operations* for more information about the ZATIM command. See *TPF Main Supervisor Reference* for more information about time keeping considerations for loosely coupled processing.

---

**CLKS0051A PRESS 'TOD ENABLE SET' KEY TO SYNC CPC TOD CLOCKS**

**Explanation:** If the time-of-day (TOD) Clock Override facility is not present, the TOD clock must be enabled to set the TOD clock. The architecture of the enable switch varies according to the type of processor. Once pressed, the TOD clock remains enabled for setting for approximately ten seconds. When the set key is not enabled, the TOD clock is known as secure. The TOD clock cannot be set when it is secure.

**System Action:** None.

**User Response:** Press the TOD clock enable switch.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0054W NOT ALL PROCESSORS IN 1052 STATE**

**Explanation:** The time-of-day (TOD) clock on this CPC is useable and confirmed. There are no other confirmed TOD clocks in the complex on which to synchronize but there are other processors above 1052 state. External confirmation from the operator is required.

**System Action:** The CLKS0055A message follows.

**User Response:** Determine why there are other CPCs in the complex that have unconfirmed TOD clocks, yet are above 1052 state.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0055A ALL OTHER ACTIVE PROCESSORS HAVE UNSYNCED TODS CURRENT TOD MSTR IS *stat* ACTIVE CPUID *id* CPU *serial-no* SET THE TOD CLOCK USING THE FORMAT: 'ZATIM HHMM TOD ...'**

**Where:**

*stat* Blank or NOT depending on the status.

*id* The CPU ID.

*serial-no*
The serial number of the lowest available I-stream on the current Master.

**Explanation:** This processor complex could not find another processor complex with which to confirm its time. Consequently, external confirmation from the complex operator is required.

The master processor is not confirmed synchronous. If a Sysplex Timer (STR) is available for a synchronization source, then the CLKS87I and CLKS18I messages follow.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** Enter the ZATIM command to confirm the current clock setting.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0055E UNABLE TO SYNC THIS TOD ALL OTHER ACTIVE PROC'S HAVE UNSYNCED TODS CURRENT TOD MSTR IS *stat* ACTIVE CPUID *id* CPU *serial-no* 'ZATIM SET TOD' REQ'D ENTER FORMAT: 'ZATIM HHMM TOD HHMMSS MMDDYY'**

**Where:**

*stat* Blank or NOT.

*id* The active central processing unit (CPU) ID.

*serial-no*
The serial number for the CPU.

**Explanation:** This processor complex could not find another processor complex with which to confirm its time. Consequently, external confirmation from the complex operator is required.

The master processor is not confirmed synchronous.

**System Action:** None.

**User Response:** Enter the ZATIM command to confirm the current clock setting.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0056E ZATIM, ENTERED ON CPUID *id*, HAS RESET TOD CLOCK TO RESYNC THE TOD ON THIS CPU, EITHER REIPL OR CYCLE TO 1052 AND SET TOD CLOCK ON MASTER**

**Where:**

*id* The CPU ID.

**Explanation:** This message applies to loosely coupled TPF systems only. An interprocessor communications (IPC) message was received that indicates another processor has performed a set time request. The time-of-day (TOD) clock for this processor, therefore, is no longer correct.

Automatic resynchronization is prevented because this processor is not in 1052 state.

**System Action:** None.

**User Response:** Do one of the following:

- Re-IPL the processor to become synchronous with the loosely coupled complex
- Cycle to 1052 state and set the time again.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0057E CTKI RETRIEVAL ERROR BY TOD SYNC DURING CYCLE, CYCLE ABORTED**

**Explanation:** Keypoint I (CTKI) could not be retrieved from disk during a TPF system cycle up. Consequently, the set request sequence numbers could not be validated and time-of-day (TOD) synchronization may be in doubt.

**System Action:** None.

**User Response:** Do the following:

1. Determine why keypoint I could not be retrieved from disk and correct the problem.
2. Try to cycle the TPF system again.

See *TPF Operations* for more information about the ZATME and ZCYCL commands.

---

**CLKS0058E TOD SYNC CHECK HAS OCCURRED ISTREAMS (PHYSICAL ID)** *is-list* **MASTER CPU SERIAL NUMBER IS** *serial-no* **MASTER CPU IS** *stat1* **ACTIVE MASTER CPU-ID IS** *id* **MASTER STR ID:** *str id* **NETWORK ID:** *network id*

**Where:**

*is-list*
The 16-byte list of I-stream physical addresses, which are displayed as a hexadecimal number.

*serial-no*
The serial number of the lowest available I-stream on the current Master.

*stat1*
Blank or NOT depending on the status.

*id* The master CPU ID.

*str id*
The Sysplex Timer (STR) ID.

*network id*
The network ID.

**Explanation:** A confirmed synchronization check has occurred. The instruction steams that took synchronization checks are listed along with the serial number and CPU ID of the master processor (whether the master processor is active) and the master STR information.

**Notes:**

1. The serial number of the master processor is displayed but the CPU address portion of the serial number (the rightmost two bytes) corresponds to the lowest available instruction stream on the processor and not the IPLed or main instruction stream.
2. On a TPF system without a time-of-day (TOD) RPQ or an STR, only the first two lines of this message are displayed and a CTL-67B follows if unable to obtain local synchronization.
3. On a TPF system with a TOD RPQ or an STR, a CTL-67B follows if unable to obtain local synchronization.
4. The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection(ESCON) Architecture.

**System Action:** None.

**User Response:** If the processor is loosely coupled, the processor complex may become internally synchronous. In this case, the processor continues running but will not be synchronous with the external time source.

A re-IPL is required to synchronize the complex in a loosely coupled TPF system.

See *TPF Main Supervisor Reference* for more information about time keeping considerations for loosely coupled processing.

---

**CLKS0059E TOD SYNC CHECK HAS OCCURRED ISTREAMS (PHYSICAL ID)** *is-list* **TOD SYNC SEL. ADDR IS** *ssa* **MASTER CPU SERIAL NUMBER IS** *serial-no* **MASTER CPU IS** *stat1* **ACTIVE MASTER CPU-ID IS** *id* **TOD SYNC INTERFACE IS** *stat2* **OPERATIONAL**

**Where:**

*is-list*
The 16-byte list of I-stream physical addresses, which are displayed as a hexadecimal number.

*ssa* The synchronization selection address.

*serial-no*
The serial number of lowest available I-stream on the current master.

*stat1, stat2*
Blank or NOT depending on the status.

*id* The master CPU ID.

**Explanation:** A confirmed synchronization check occurred. The instruction streams that took synchronous checks are listed, along with the synchronization selection address in use at the time, the serial number, and the CPU ID of the master processor, whether the master processor is active, and whether the time-of-day (TOD) RPQ is operational.

**Notes:**

1. The serial number of the master processor is displayed but the CPU address portion of the serial number, the rightmost two bytes, corresponds to the lowest available instruction stream on the processor, not the IPLed or main instruction stream.
2. On a TPF system without a TOD RPQ or an STR, only the first two lines of this message are displayed and a CTL-67B follows if unable to obtain local synchronization.
3. On a TPF system with a TOD RPQ or an STR, a CTL-67B follows if unable to obtain local synchronization.
4. The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection(ESCON) Architecture.

**System Action:** None.

**User Response:** If the processor is loosely coupled, the processor complex may become internally synchronous. In this case the processor continues running but will not be synchronous with the external time source.

A re-IPL is required to synchronize the complex in a loosely coupled TPF system.

See *TPF Main Supervisor Reference* for more information about time keeping considerations for loosely coupled processing.

---

**CLKS0060E TOD SET SEQUENCE NUMBER IN CORE DOES NOT MATCH CTKI TOD VALUE MAY BE INCORRECT CYCLE ABORTED**

**Explanation:** The number of SST time requests made to the TPF systemis kept in keypoint I. Each processor complex also keeps its own number of set time requests.

If the number of requests for the processor complex does not match the number in the TPF system, the processor complex has missed a TPF system set time request. This would cause the processor to be out of synchronization with the TPF system.

**System Action:** Cycling from 1052 state is ended when the ECB is exited.

**User Response:** Do the following:

1. Enter a set time request.
2. Try to recycle the TPF system. If cycling fails again, re-IPL the processor complex.

See *TPF Operations* for more information about the ZATME and ZCYCL commands.

---

**CLKS0061E TOD CLOCK NOT SYNCHRONIZED CYCLE ABORTED**

**Explanation:** An error occurred that caused a time-of-day (TOD) clock not to be synchronized. A hard synchronization check in 1052 state, for example, would create this situation.

**System Action:** The ECB is exited.

**User Response:** The TOD clock must be set before cycling above 1052 state. Enter a set time request for the processor complex.

See *TPF Operations* for more information about the ZATME and ZCYCL commands.

---

**CLKS0063E SYNCHRONIZATION ERROR WITH SYNC SEL ADDR *ssa* EXTERNAL SYNCH FAILED — CPC SYNCHD LOCALLY**

**Where:**

*ssa* The synchronization selection address (SSA).

**Explanation:** An error occurred during restart because synchronization could not take place along the path specified. There may be an incorrect synchronization selection address (SSA) value or an incorrect representation of the selection addresses in the cabling of the time-of-day (TOD) RPQ.

The loosely coupled processor complex succeeded in becoming internally (locally) synchronous. Keypoint I contains the synchronization selection addresses (SSA) associated with the various processors.

**System Action:** TOD clock validation during restart is ended.

**User Response:** The synchronization selection address being used may be incorrect. The selection address may be determined by entering the ZDTIM TOD command.

If it is incorrect, modify keypoint I with the correct SSA and enter the set time request again. Ensure that the TOD RPQ or the TOD Synchronization Compatibility (TSC) hardware is cabled correctly to each of the processors according to the selection addresses in keypoint I. Also, re-IPL the TPF system.

Enter the ZATIM command again to set the time after a ZATIM TSC migration message is entered.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

See *TPF Operations* for more information about the ZATIM command. See *TPF Main Supervisor Reference* for more information about time keeping considerations for loosely coupled processing.

---

**CLKS0068E TOD CLOCK NOT OPERATIONAL — ISTREAM *lid ( pid )***

**Where:**

*lid* The logical identifier (ID), which is displayed as a decimal number.

*pid* The physical identifier (ID), which is displayed as a hexadecimal number.

**Explanation:** During the time-of-day (TOD) clock hardware validation, a TOD clock in the processor complex was found to have a permanent hardware error that caused it not to be operational. All TOD clocks in a processor complex must be operational.

**System Action:** None.

**User Response:** Do the following:

1. Remove the TOD clock from the process complex, if possible.
2. Re-IPL the TPF system.
3. See your IBM service representative to check the TOD clock error.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0069T RESTART SCHEDULER EXITED**

**Explanation:** This message informs you that an error occurred during restart that forces its termination. The message is preceded by a dump that provides information as to the actual problem found.

**System Action:** None.

**User Response:** Do the following:

1. Review the system error dump to determine the cause of the error.
2. Correct the error.
3. Re-IPL the TPF system.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0072W INITIAL SET VALIDATION FAILED**

**Explanation:** This message informs you that the validation of the processor complex time-of-day (TOD) clocks failed. The tightly coupled clocks running in a processor complex must be high-order and low-border synchronous, as well as being free from hardware errors, to be valid. Validation is trying again in case the cause of the problem was transient.

**System Action:** None.

**User Response:** This warning message may indicate underlying timing problems between instruction streams.

If the problem continues, have your system programmer determine the cause of the inter-I-stream response time and correct it.

See *TPF Operations* for more information about the ZATIM command.

**CLKS0073T UNABLE TO LOCALLY SYNCHRONIZE THIS CPC**

**Explanation:** The computer processor complex was not able to be made internally synchronous. The attempt to set the time-of-day (TOD) clocks on the CPC is ended. The processor remains in 1052 state.

**System Action:** An irrecoverable system error is issued.

**User Response:** Re-IPL the processor. If it fails again, have your system programmer check the instruction stream status table to determine which TOD clock is failing to become synchronous.

See *TPF Operations* for more information about the ZATIM command.

**CLKS0074W UNDETERMINED CLOCK ERROR**

**Explanation:** The time-of-day (TOD) clock error message segment was invoked but no message was indicated. This indicates that a logic error occurred in the TOD clock code.

**System Action:** None.

**User Response:** See your IBM service representative, and provide a dump and console sheet information for analysis.

See *TPF Operations* for more information about the ZATIM command.

**CLKS0075E UNABLE TO SYNCH TO STR – CPC WILL SYNC LOCALLY**

**Explanation:** An error occurred after entering the ZATIM STR command. The processor could not synchronize to the external synchronization source, which is STR.

This error may have occurred for any of the following reasons:

- An external synchronization source does not exist
- The STR ID is not valid
- The synchronization source is not compatible
- The STR ports are not operational
- The STR subset DIAG command failed.

**System Action:** The time of day (TOD) clock synchronizes locally.

**User Response:** Check the STR to ensure that the:

- STR ports are operational
- System configuration is correct
- STR ID is valid.

**CLKS0081I SOURCE:** *src* **SSR:** *ssr* **STATUS:** *status* **MASTER— CPUID:** *id* **SERIAL:** *serial* **MODEL:** *model* **SSA:** *ssa* **MASTER SYNC SOURCE — STR NETWORK ID:** *network id*

**Where:**

*src* One of the following:

**REMOTE**
This processor is synchronized to a remote source.

**MASTER**
This processor is the synchronization source.

**LOCAL**
This processor is not synchronized to an external source.

*ssr* Two hexadecimal digits in networks with a time-of-day (TOD) RPQ. If a Sysplex Timer (STR) is available, this field may have a default value. If the network has no TOD RPQ, this field is not included.

*status*
One of the following:

**CONFIRMED**
The time verified with an external source.

**CLOCK SECURE**
The TOD is not enabled for setting.

**WAITING FOR CONFIRMATION**
The CPC is waiting for time verification from an external source.

**LOCALLY SYNCHRONOUS**
The CPC clocks are internally synchronous.

**NOT LOCALLY SYNCHRONOUS**
The CPC is not internally synchronous.

**CLOCK ERROR**
A TOD clock is not operational.

*id* The CPU ID for the Master CPC.

*serial*
The serial for the Master CPC.

*model*
The model for the Master CPC.

*ssa* Two hexadecimal digits in the synchronization selection address (SSA) SSA field of the TOD master in networks with a TOD RPQ. If a Sysplex Timer (STR) is available, this field may have a default value. If the network has no TOD RPQ, then this field is not included.

*network id*
The STR network ID. If the master synchronous source is not an STR, then the last line of this CLKS0081I message is not included.

**Explanation:** The term *confirmed* has two meanings with loosely coupled processors:

- Local

- Remote.

If a processor is confirmed *local*, it is internally synchronous but not synchronized with the complex. If a processor is confirmed *remote*, the processor is continually being verified through the TOD RPQ or an STR.

As a condition for operation, a tightly coupled processor complex must be *internally synchronous*. That is, all the I-streams are synchronous with the main instruction stream.

The master processor is locally confirmed, if the TOD RPQ is used. The master processor remotely confirmed, if an STR is used.

When the CPU ID is indicated by a period (.), the processor is not active.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTIM command. See *TPF Main Supervisor Reference* for more information about clocks.

---

**CLKS0082E STR ERROR – PORT *port number* NOT OPERATIONAL**

**Where:**

*port number*
One of the two CPC stepping ports.

**Explanation:** During restart, the CPC stepping port was not operational. This port is not able to receive the Sysplex Timer (STR) oscillator signal.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** See your IBM service representative.

---

**CLKS0083I TWO STRS INSTALLED IN UNCOUPLED MODE**

**Explanation:** Each CPC stepping port on this CPC is connected to a Sysplex Timer (STR) The two STRs are not in high-availability mode because they are uncoupled. One of the ports is disabled. This ensures that fallback does not occur automatically to an STR that is not synchronized with the STR on the primary port.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** Determine whether the CPC configuration is correct or whether the two STRs should be coupled. If the STRs remain uncoupled, the CLKS0087I message is displayed twice (once for the alternate port and once for the primary port). You may then select the STR that you want for the synchronization source. The port connected to the other STR becomes disabled.

---

**CLKS0084E ILLEGAL I-STREAM SELECTED — NO TOD SSA IN CTKI**

**Explanation:** The chosen I-stream does not have a synchronization selection address (SSA) defined in keypoint I.

**System Action:** None.

**User Response:** Do one of the following:

- Re-IPL an I-stream that has an SSA defined in Keypoint I.
- If you want to IPL on the I-stream that you have selected, code the PROCs parameter again in the CONFIG macro in the system installation package (SIP). This ensures that an SSA is defined in keypoint I for the selected I-stream.

---

**CLKS0085E STR ERROR — UNABLE TO READ STR DATA**

**Explanation:** One of the following errors occurred:

- During restart, an unsuccessful attempt was made to read the Sysplex Timer (STR) data, such as the active stepping port, the STR ID, the STR Network ID, or to put the CPC into STR-enabled mode.
- There may be a problem with the processor controller on the CPC.

**System Action:** One of the following actions occurs:

- If the error occurred while trying to read data on the primary port, the CPC is synchronized locally rather than with the STR.
- If the error occurred while trying to read data on the alternate port, the CPC is still synchronized with the STR on the primary port.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**User Response:** See your IBM service representative to check the possible problem with the processor controller.

---

**CLKS0086I INCOMPATIBLE WITH MASTER SYNC SOURCE CPC SYNCHRONIZED LOCALLY**

**Explanation:** This CPC is operating in one of the following scenarios:

- This CPC is directly connected to a Sysplex Timer (STR) but the master synchronization source for the complex is not an STR.
- This CPC is directly connected to an STR and the master synchronization source for the CPC is an STR. However, the STRs present are not the same and they are uncoupled.
- This CPC has a time-of-day (TOD) RPQ, but the master synchronization source for the CPC is an STR, and there is no TOD Synchronization Compatibility (TSC) hardware attached to the STR.

**System Action:** In any of the previous cases, the CPC is synchronized locally because the CPC is not able to use the master synchronization source.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**User Response:** Determine whether one of the following problems exists and take the appropriate action:

- If the CPC is attached to the wrong STR, attach the CPC to the correct STR.
- If a ZATIM command was entered that changed the synchronization source from an STR to the TOD RPQ, enter a ZATIM command to correct the source of time.
- If there is TSC hardware attached to the STR but the information was not included in keypoint I, include the TSC hardware information in keypoint I.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0087I STR AVAILABLE ON** *type port* **PORT: STR ID=***str id* **NETID=***network id*

**Where:**

*type port*
The alternate or primary port.

*str id*
The Sysplex Timer (STR) ID.

*network id*
The network ID.

**Explanation:** The time-of-day (TOD) clock for this CPC is unconfirmed. If this is a loosely coupled complex, there are no other confirmed CPCs. This message is issued to inform you that an STR is available for use as a time and synchronization source. When the message is issued for the alternate port, it indicates that the two CPC stepping ports are connected to two different, uncoupled STRs.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** If you want to use the STR time, enter the ZATIM command with the STR parameter when confirming the TOD clock. The STR is then used automatically as the synchronization source.

If the message is issued for the alternate port, as well as the primary port, and you want to use the STR on the alternate stepping port as the synchronization source, enter the ZATIM command with the ALTPORT parameter when confirming the TOD clock.

Do ***not*** include the ALTPORT parameter if you want to use the STR on the primary stepping port.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0088E STR ERROR — UNABLE TO READ STR DATA**

**Explanation:** An unsuccessful attempt was made to retrieve the Sysplex Timer (STR) time. Therefore, the STR time could not be displayed on the console.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** Determine whether the CPC stepping port is operational or if there is a problem with the processor controller on the CPC.

---

**CLKS0089I UNABLE TO READ STR ALTERNATE PORT INFORMATION CANNOT DETERMINE IF THE STR COMPLEX IS IN HIGH AVAILABILITY MODE**

**Explanation:** To determine whether the CPC is connected to two coupled Sysplex Timers (STRs), the STR ID and the STR network ID on each CPC stepping port must be read. Because an unsuccessful attempt was made to read the data on the alternate CPC stepping port, the high-availability mode determination cannot be made. If two STRs are coupled, high-availability mode exists. If the CPC is connected to two uncoupled STRs, then one port is not disabled.

Either the CLKS0082E or the CLKS0085E message should accompany this message.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** The TPF system continues the IPL process.

**User Response:** See your IBM service representative.

---

**CLKS0090I STRID:** *str id* **NETWORK ID:** *network id* **PORT NUMBER:** *port number*

**Where:**

*str id*
The Sysplex Timer (STR) ID.

*network id*
The network ID.

*port number*
The CPC stepping port that is receiving the STR oscillator signal.

**Explanation:** This informational message, which is issued with the CLKS0018I message, provides details about the STR when a ZDTIM STR command is entered.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTIM command.

---

**CLKS0091A SUBSYSTEM** *xxx* **ZATIM REQUEST NOT TRANSMITTED TO ALL ACTIVE PROCESSORS BECAUSE OF SIPC TIMEOUT ENTER A ZATIM SET REQUEST TO SYNCHRONIZE THE SUBSYSTEM CLOCKS**

**Where:**

*xxx* The subsystem name.

**Explanation:** The clocks for the subsystem referenced in the message are not synchronized across all active processors because a timeout condition occurred during system

interprocessor communications (SIPC) transmission.

**System Action:** None.

**User Response:** Enter the ZATIM SET command to cause the TPF system to try to synchronize the subsystem clocks again on all active processors.

See *TPF Operations* for more information about the ZATME, ZCYCL, and ZATIM commands.

---

**CLKS0092E CANNOT SEND TOD CLOCK IPC MESSAGES TO PROCESSOR *x* TOD CLOCK IPC MESSAGE LOST**

**Where:**

*x* The processor name.

**Explanation:** More than 25 consecutive time-of-day (TOD) clock messages were returned for the processor referenced in the message.

**System Action:** The interprocessor communications (IPC) message is not transmitted again.

**User Response:** Determine why the processor is not receiving its TOD clock IPC messages. You may need to enter a new ZATIM TOD command to synchronize the TOD clock on all of the processors.

See *TPF Operations* for more information about the ZATIM command.

---

**CLKS0093I STR IS NOT IN HIGH AVAILABILITY MODE**

**Explanation:** This message informs you that both CPC stepping ports are connected to the same Sysplex Timer (STR)

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** Determine whether the configuration is correct or whether each CPC stepping port should be connected to a unique STR.

---

**CLKS0094E STR ERROR — LOTE VALUE IS ZERO**

**Explanation:** This message informs you that an unsuccessful attempt was made to retrieve the sysplex timer (STR) time.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** Processing is continued.

**User Response:** None.

---

**CLKS0095I RESYNCED CLOCK DUE TO SYNC CHECK**

**Explanation:** The clock has been resynchronized successfully because of a required synchronous check that may have occurred with a port availability change.

**System Action:** None.

**User Response:** None.

---

**CLKS0096W RESYNC DUE TO SYNC CHECK FAILED**

**Explanation:** An attempt to resynchronize the clocks because of a synchronization check was not successful. The synchronization check error may have occurred because of a port availability change.

**System Action:** A synchronization check message follows this message, and the clocks will now go local.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Correct the error, keeping in mind it may be necessary to enter the ZATIM command from 1052 state to bring the clock back to a remote confirmed state.

See *TPF Operations* for more information about the ZATIM command.

# CLMB–CNOS

---

**CLMB0001W ACTIVE LOCKS CLEARED FROM CU *xxxx* CYCLING TO DEACTIVATE STATUS**

**Where:**

*xxxx*
The address of the control unit with active locks.

**Explanation:** During the deactivation of the host processor, an unlock command was issued to the specified control unit. The control unit contained locks either held or awaited by the host processor. This is not an error situation although it is abnormal to find lock names that are engaged by a processor that is being deactivated.

**System Action:** Deactivation is continued.

**User Response:** None.

---

**CLM00002E CONNECT TO LOCKING FACILITY FAILED, ENTER: ZCORO NOAPPLY – TO INITIALIZE THE RECOVERY LOG, OR ZCORO APPLY – TO APPLY THE RECOVERY LOG WITHOUT LOCKS**

**Explanation:** Coupling facility (CF) locking restart was unsuccessful acquiring a concurrency filter lock facility (CFLF) control unit or a CF lock to ensure a safe restore of the recovery log.

**System Action:** None.

**User Response:** Determine whether it is safe to apply the recovery log. Applying the recovery log without correct locking can affect databse integrity. If you do ***not*** apply the recovery log, you can lose valuable data from the log.

You ***must*** do one of the following:

- Respond to this message.
- Stop the initial program load (IPL) and do one of the following:
  - If there is another processor in the loosely coupled complex, enter **ZPSMS PR FORCE DEACT** from an active processor to forcibly deactivate the processor that has the CFLF connection problem. The processor from

which **ZPSMS PR FORCE DEACT** is entered takes over the recovery log of the target processor.

– If the entire loosely coupled complex cannot connect to the CFLF control units or CFs (for example, if a power outage occurred), you can initiate a destructive IPL to take over the recovery logs for all other processors in the same loosely coupled complex.

**Note:** Specify D in response to the IPLB0147A message to initiate a destructive IPL. See the IPLB0147A message for more information.

See *TPF Operations* for more information about the ZCORO and ZPSMS commands.

---

**CLM10001I CFLF RESTART SUCCESSFUL**

**Explanation:** All online concurrency filter lock facility (CFLF) subsystems are successfully connected during restart.

**System Action:** Processing is continued.

**User Response:** None.

---

**CLM10003W RUNNING IN FORCED UNIPROCESSOR MODE**

**Explanation:** This message is issued when:

- Concurrency filter lock facility (CFLF) restart fails on this first processor. Therefore, the TPF systemprevents other processors from joining the complex.
- A CFLF connect order is not tried because of an upcoming record cache subsystem (RCS) initialization.

**System Action:** If RCS initialization is successful, the TPF systemforces a re-IPL and tries the connect order again.

If RCS initialization is unsuccessful or if a second attempt fails, the TPF system continues restart in uniprocessor mode.

**User Response:** Correct the hardware or licensed internal code problem.

---

**CLM10004W PROCESSOR *id* RUNNING IN FORCED UNIPROCESSOR MODE**

**Where:**

*id* The processor ID of the processor that forced uniprocessor mode.

**Explanation:** To maintain database integrity, the first processor to IPL (*id*) is preventing other processors from joining the complex.

**System Action:** An irrecoverable system error (CTL-708) is issued.

**User Response:** Re-IPL this processor after the first processor successfully completes concurrency filter lock facility (CFLF) restart.

---

**CLM20001W ORDER *order* FAILED, CODE *ret_code* DEVICE *device* SSID *ssid***

**Where:**

*order*
The concurrency filter lock facility (CFLF) order code.

*ret_code*
The CFLF return code.

*device*
The device number.

*ssid* The subsystem ID.

**Explanation:** The concurrency filter lock facility (CFLF) connect order failed on the specified device.

**System Action:** The TPF system initializes the record cache subsystem unless the return code was X'FF'.

**User Response:** If the return is X'FF', a re-IPL of the multi-path lock facility (MPLF) control unit may be necessary.

---

**CLM20002W CANNOT RECOVER COPY LOCK, DEVICE *device* SSID *ssid***

**Where:**

*device*
The device number.

*ssid* The subsystem ID.

**Explanation:** A module is in copy state, but the concurrency filter lock facility (CFLF) partition reserved for the copy lock contains either no locks or more than one lock.

**System Action:** A disconnect order is issued to the CFLF partition reserved for the copy lock, followed by a connect order to that partition.

**User Response:** Enter the ZMCPY ABORT command after restart is completed.

---

**CLM20003I WAITING TO CONNECT, DEVICE *device* SSID *ssid***

**Where:**

*device*
The device number.

*SSID*
The subsystem ID.

**Explanation:** A connect order failed because a disconnect order, which was issued previously, is currently in progress.

**System Action:** The TPF system waits for the disconnect to complete and then retries the connect order.

**User Response:** None.

---

**CLM20091E TIMEOUT DURING CONNECT DEVICE *dev* SSID *ssid***

**Where:**

*device*
The device number.

*ssid* The subsystem ID.

**Explanation:** The TPF system retried the connect order the maximum number of times allowed.

**System Action:** The TPF system returns with a bad return code and the connect order fails.

**User Response:** This may be a hardware error. Determine

why the disconnect order did not complete.

If the return code shown in the CLM201W message, which follows this message, is X'FF', a re-IPL of the multi-path lock facility (MPLF) control unit may be necessary.

---

**CLM60001W UNABLE TO SET LOCK OF CF *cfname* FOR PROCESSOR *id***

**Where:**

*cfname*
The name of the coupling facility (CF).

*id* The processor ID.

**Explanation:** During processing of ZPSMS command or a destructive initial program load (IPL) request, an attempt to obtain the CF lock for the CF referenced in the message was not successful. This error occurs when the CF fails to respond to CF commands.

**System Action:** Processing continues for other CFs in the locking configuration.

**User Response:** Do the following:

1. Review the preceding messages to determine the cause of the error.
2. Correct the error.

See *TPF Operations* for more information about the ZPSMS command.

---

**CLM60002W UNABLE TO DETACH USER FROM STRUCTURE *strindex* ON CF *cfname* FOR USER ID *userid***

**Where:**

*strindex*
The structure index.

*cfname*
The name of the coupling facility (CF).

*userid*
The identifier (ID) of the locking structure user that failed.

**Explanation:** The CF was unable to detach the processor referenced in the message from the locking structure or the notification structure on the CF. This error occurs when the CF is unable to proces commands. Additional error messages usually accompany this message.

**System Action:** Processing continues for other locking structures on this CF and for other CFs in the locking configuration.

**User Response:** Do the following:

1. Review the preceding messages to determine the cause of the error.
2. Correct the error.

---

**CLM60003W UNABLE TO RELEASE LOCK OF CF *cfname* FOR PROCESSOR *id***

**Where:**

*cfname*
The name of the coupling facility (CF).

*id* The processor ID.

**Explanation:** During processing of a ZPSMS command or a destructive initial program load (IPL) request, an attempt to release the CF lock for the CF referenced in the message was not successful. This error occurs when the CF fails to respond to CF commands.

**System Action:** Processing continues for other locking structures on this CF and for other CFs in the locking configuration.

**User Response:** Do the following:

1. Determine why the CF is failing to respond.
2. Correct the problem.

See *TPF Operations* for more information about the ZPSMS command.

---

**CLM60004W UNABLE TO DISCONNECT FROM CF *cfname*, RRC=0008080B**

**Where:**

*cfname*
The name of the coupling facility (CF).

**Explanation:** During processing of a ZPSMS command, an attempt to disconnect from the locking structures on the CF referenced in the message ws not successful since activity against the locking structures did not quiesce.

**System Action:** Processing continues for other CFs in the locking configuration.

**User Response:** See your IBM service representative to determine the cause of the problem.

---

**CLM60005W UNABLE TO DISCONNECT USER ID *userid* FROM COUPLING FACILITY LOCKING STRUCTURES DUE TO READ ERROR**

**Where:**

*userid*
The identifier (ID) of the locking structure user that failed.

**Explanation:** During processing of a ZPSMS command or a destructive initial program load (IPL) request, an error occurred while trying to find a coupling facility (CF) record on file.

**System Action:** Processing continues for other locking structures on this CF and for other CFs in the locking configuration.

**User Response:** Do the following:

1. Review the preceding messages to determine the cuase of the error.
2. Correct the error.

See *TPF Operations* for more information about the ZPSMS command.

---

**CLM80001E INVALID MESSAGE SYNTAX**

**Explanation:** An error occurred because the ZDLCK command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZDLCK command.
2. Entire the ZDLCK command again by using the correct format.

See *TPF Operations* for more information about the ZDLCK commands.

---

**CLM80002E CANNOT ALLOCATE MEMORY**

**Explanation:** An error occurred while processing a ZDLCK command because there is not enough heap storage available.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine why the TPF system cannot obtain enough heap storage.
2. Correct the problem.
3. Enter the ZDLCK command again.

See *TPF Operations* for more information about the ZDLCK commands.

---

**CLM80004E LOCK NAME NOT FOUND**

**Explanation:** The ZDLCK DISPLAY or ZDLCK DELETE command was entered to display the lock names that exist in the coupling facility (CF). However, an error occurred because the lock name specified was not found on any CF in the CF locking configuration.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Ensure that the lock name specified is valid.
2. Enter the ZDLCK DISPLAY or ZDLCK DELETE command again.

   **Note:** If you are entering the ZDLCK DISPLAY command with a file address specified, enter the command from the appropriate subsystem.

See *TPF Operations* for more information about the ZDLCK DISPLAY and ZDLCK DELETE commands.

---

**CLM80005E CF LOCK READ FAILED. RETURN CODE** *retcode*

**Where:**

*retcode*
The return code.

**Explanation:** The LEMIC macro with the READ parameter specified was issued to read information about one or more locks in the coupling facility (CF). However, an error occurred and the return code referenced in the message was issued.

**System Action:** The ZDLCK command is rejected.

**User Response:** Do the following:

1. Review the return code on the LEMIC macro to determine the cause of the error.
2. Correct the error.
3. Enter the ZDLCK command again.

See *TPF System Macros* for more information about the LEMIC macro. See the*TPF C/C++ Language Support User's Guide* for more information about the `tpf_lemic` function. See *TPF Operations* for more information about the ZDLCK commands.

---

**CLM80007E READ LOCK ILLOGICAL CONDITION**

**Explanation:** An error occurred because an illogical condition was detected.

**System Action:** The function is not performed.

**User Response:** See your IBM service representative to determine the cause of the error.

---

**CLM80008E CANNOT DECODE FILE ADDRESS**

**Explanation:** The ZDLCK DISPLAY or ZDLCK DELETE command was entered with the FA parameter specified to display information about the locks for a specific file address or to delete locks. However, an error occurred because the TPF system was unable to decode the file address into module, cylinder, head and record (MCHR).

**System Action:** The function is not performed.

**User Response:** Do the following:

1. Verify that the file address specified is valid in this subsystem.
2. Enter the ZDLCK DISPLAY or ZDLCK DELETE command again specifying the FA parameter.

See *TPF Operations* for more information about the ZDLCK DISPLAY and ZDLCK DELETE commands.

---

**CLM80009I ZDLCK DISPLAY STARTS**

**Explanation:** This is the normal response to the ZDLCK DISPLAY command with the FA or LOCKNAME parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDLCK DISPLAY command and for an example of the informational display.

---

**CLM80010E MODULE NUMBER IS NOT VALID**

**Explanation:** The ZDLCK DISPLAY command was entered with the MOD parameter specified to display information about the locks for a specific module number. However, an error occurred because the TPF system was unable to decode the file address into module, cylinder, head and record (MCHR) format.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Verify that the file address specified is valid in this subsystem.
2. Enter the ZDLCK DISPLAY command again and specify a valid module number.

See *TPF Operations* for more information about the ZDLCK DISPLAY command.

---

**CLM80011I ZDLCK DISPLAY MOD STARTS**

**Explanation:** This is the normal response to the ZDLCK DISPLAY command with the MOD parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDLCK DISPLAY command and for an example of the informational display.

---

**CLM80012I ZDLCK DISPLAY MOD CONTINUES**

**Explanation:** This is the normal response to the ZDLCK DISPLAY command with the MOD parameter specified when a continuation was necessary and **ZPAGE** was entered.

**System Action:** The display continues.

**User Response:** None.

See *TPF Operations* for more information about the ZDLCK DISPLAY command.

---

**CLM80027I LOCK DELETION COMPLETE, CTL-4627 MAY OCCUR**

**Explanation:** The ZDLCK DELETE command was entered to delete a specific lock residing on a coupling facility (CF).

**System Action:** The lock is deleted.

**User Response:** None.

See *TPF Operations* for more information about the ZDLCK DELETE command.

---

**CLTR0001I TCP/IP CONFIGURATION TABLE INITIALIZED AND FILED**

**Explanation:** The Transmission Control Protocol/Internet Protocol (TCP/IP) configuration table has been initialized and filed for the first time during TPF system restart. Once the table is filed, this message will not be displayed on subsequent IPLs of the TPF system.

This message can also occur when the Transmission Control Protocol/Internet Protocol (TCP/IP) configuration table must be initialized as a result of an error while attempting to convert from #IBMM4 to #IBMMP4 fixed records.

**System Action:** None.

**User Response:** None.

---

**CLTR0006I FILE COPY CONVERSION OF TCP/IP CONFIGURATION TABLE SUCCESSFUL**

**Explanation:** The TCP/IP configuration table was successfully converted from #IBMM4 records to #IBMMP4 records.

**System Action:** TPF restart continues.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the TCP/IP configuration table

---

**CLUS0001I NEGATIVE RSP TO CLU-CLU SESSION COMMAND CLU NAME:** *clu* **CMD:** *cmd* **SENSE:** *sense*

**Where:**

*clu* The control point logical unit (CLU).

*cmd*
The command type.

*sense*
The sense code.

**Explanation:** When a negative response to a CLU-CLU private protocol path information unit (PIU) is received, a message is sent to the communications console describing the CLU name, command type, and sense code.

**System Action:** None.

**User Response:** None.

---

**CLVQ0050A CCP TRACE DATA DISCARDED. RTL NOT MOUNTED**

**Explanation:** The operator requested that the communications control program (CCP) trace be written to tape, but the RTL/RTA tape is not available.

**System Action:** The TPF system stores the CCP trace table in core memory until the RTL/RTA tape is mounted. Information stored in the CCP trace table wraps around when the trace table becomes full.

**User Response:** Mount the RTL/RTA tape.

See *TPF Non-SNA Data Communications Reference* for more information about the CCP trace.

---

**CLXV0001E LEID** *xxxxxx* **RID IS 0**

**Where:**

*xxxxxx*
The logical end-point identifier (LEID) of NEF, AX.25, or the XALCI terminal.

**Explanation:** The TPF system tried to send a message to a NEF, AX.25, or the XALCI device that has a resource identifier of 0 in its WGTA entry.

**System Action:** None.

**User Response:** Do the following:

1. Inactivate the logical unit (LU).
2. Activate the LU again.

**CL110001I COMMIT/ROLLBACK TABLE INITIALIZATION.....COMPLETE**

**Explanation:** All TPF transaction services internal tables were initialized during TPF systemrestart.

**System Action:** None.

**User Response:** None.

**CL110002I COMMIT/ROLLBACK RECOVERY.....COMPLETE**

**Explanation:** Processing of the TPF transaction services recovery log was completed successfully.

**System Action:** None.

**User Response:** None.

**CL110003I LOG RECOVERY FOR CPU-X .....COMPLETE**

**Explanation:** Log takeover processing for the TPF transaction services recovery log of another processor was completed successfully.

**System Action:** None.

**User Response:** None.

**CL110004E LOG RECOVERY FOR CPU-X .....ABORTED**

**Explanation:** Log takeover processing for the TPF transaction services recovery log of another processor ended abnormally.

**System Action:** An error indicator is returned to the function that requested the log takeover. In addition, system error dumps are issued to indicate what errors caused the takeover process to discontinue.

**User Response:** Review the system error dumps to determine the cause of the problem.

**CL140011I TRANSACTION BRANCHES RECOVERED - *x***

**Where:**

*x* The number of transaction branches that were recovered.

**Explanation:** Transaction branches that are written to the recovery log but not hardened are recovered during restart.

**System Action:** None.

**User Response:** None.

**CL210001I RECOVERY LOG FOR CPU-X .....INITIALIZED**

**Explanation:** The TPF transaction services recovery log was initialized again for the specified processor.

**System Action:** None.

**User Response:** None.

**CL210002E SS/SSU CONFIGURATION HAS CHANGED FOR CPU-X , ENTER: ZCORO NOAPPLY –TO INITIALIZE THE RECOVERY LOG, OR ZCORO APPLY –TO APPLY THE RECOVERY LOG, OR RE-IPL WITH THE SAME SS/SSU CONFIGURATION**

**Explanation:** Recovery log processing detected a change in the subsystem (SS) or subsystem user (SSU) configuration between this IPL and the previous IPL. Recovery of the recovery log may result in database record corruption.

**System Action:** Recovery log processing waits until you enter the ZCORO command with the APPLY or NOAPPLY parameter specified.

**User Response:** Do the following:

1. Determine why the SS or SSU configuration changed.
2. Do one of the following:
   - Apply the recovery log. Applying the recovery log without the correct locking can affect database integrity. If you do not apply the recovery log, you can lose valuable data from the recovery log.
   - IPL the TPF system again using the same SS or SSU configuration as the previous IPL.

See *TPF Operations* for more information about the ZCORO command. See *TPF Application Programming* for more information about recovery logs.

**CL210003E SS/SSU CONFIGURATION HAS CHANGED FOR CPU-X, ENTER: ZCORO NOAPPLY –TO INITIALIZE THE RECOVERY LOG ON *ssn*, OR RE-IPL WITH THE SAME SS/SSU CONFIGURATION TO KEEP THE RECOVERY LOG ON *psn***

**Where:**

*ssn* The name of the subsystem where the recovery log was found.

*psn* The name of the subsystem where the recovery log was previously found.

**Explanation:** Recovery log processing detected a change in the subsystem (SS) or subsystem user (SSU) configuration between this initial program load (IPL) and the previous IPL. The new SS or SSU configuration has the recovery log records allocated on a different subsystem. The TPF system cannot access the previous recovery log for recovery processing.

**System Action:** Recovery log processing waits until you enter the ZCORO command with the NOAPPLY parameter specified or you re-IPL the TPF system. When you enter **ZCORO NOAPPLY**, the TPF system continues processing and initializes the recovery log in its new location. If any data is present on the previous log, it is now lost.

**User Response:** Do the following:

1. Determine why the SS or SSU configuration changed.
2. Do one of the following:
   - If this is a planned change in configuration and the TPF system was cycled down normally, the previous log will be clean and you can enter **ZCORO NOAPPLY**.

- IPL the TPF system again using the same SS or SSU configuration as the previous IPL. Abnormal changes in the configuration could result in lost data if you enter **ZCORO NOAPPLY**.

See *TPF Operations* for more information about the ZCORO command. See *TPF Application Programming* for more information about recovery logs.

---

**CL210004W UNKNOWN PROGRAM NAME** *name* **IN** *count* **LOG RECORDS**

**Where:**

*name*
The name of the program.

*count*
The number of recovery log records that contain the unknown program name.

**Explanation:** TPF transaction services recovery log records contain an unknown program name. This can occur when any new resource manager is added and a fallback condition occurs after the resource manager has written records to the recovery log.

**System Action:** The log records are discarded.

**User Response:** Do one of the following:

- If the program name associated with the discarded records is the new resource manager that sustained a fallback condition, ignore the error.
- If the program name exists in the TPF system, a software problem exists. See your IBM service representative to determine the cause of the error and to correct the problem.

See *TPF Application Programming* for more information about recovery logs.

---

**CL210005I VPARS RLOG ALLOCATION CHANGE ACCEPTED**

**Explanation:** The number of records allocated for the recovery log has been changed to allow a test system controlled by VPARs to run without filling up the VPARS buffer area. This message indicates that the new allocation has been accepted.

**System Action:** The control record is updated with the new allocation values and the rve ecovery log is initialized again.

**User Response:** None.

---

**CL220001E LOG RECOVERY FAILURE .....CYCLE UP IS INHIBITED**

**Explanation:** Log recovery processing for the TPF transaction services recovery log ended abnormally.

**System Action:** The cycle inhibit indicator is set and system restart is ended. In addition, system error dumps are issued to indicate what errors caused the recovery process to discontinue.

**User Response:** Review the system error dumps to determine the cause of the problem.

---

**CMKH0001E MACHINE CHECK RECURSION ON I-STREAM aa (CPU bb) OPSW1 —** *cccccccc cccccccc* **OPSW2 —** *dddddddd dddddddd* **MCIC1 —** *eeeeeeee eeeeeeee* **MCIC2 —** *ffffffff ffffffff* **EDC1 —** *gggggggg* **EDC2 —** *hhhhhhhh* **FSA1 —** *iiiiiiii* **FSA2 —** *jjjjjjjj* **FLOG1 —** *kkkkkkkk kkkkkkkk* **FLOG2 —** *llllllll llllllll kkkkkkkk kkkkkkkk llllllll llllllll*

**Where:**

*a...a*
The I-stream number of the machine checked engine.

*b...b*
The CPU address of the machine checked engine.

*c...c* The machine check old PSW (MCOPSW) of the first machine check interruption.

*d...d*
The MCOPSW of the second machine check interruption.

*e...e* The machine check interruption code (MCIC) of the first machine check interruption.

*f...f* The MCIC of the second machine check interruption.

*g...g*
External damage code (EDC) of the first machine check interruption.

*h...h*
The EDC of the second machine check interruption.

*i...i* Failing (absolute) storage address (FSA) of the first machine check interruption (or zero).

*j...j* The FSA of the second machine check interruption (or zero).

*k...k*
Fixed logout (FLOG) of the first machine check interruption.

*l...l* The FLOG of the second machine check interruption.

**Explanation:** The machine check FLIH (CPPMKH) issues this message when it is interrupted by a second machine check.

**System Action:** The TPF system is restarted by CPPMKH.

**User Response:** None.

See *TPF Main Supervisor Reference* and *ESA/390 Principles of Operation* for more information about machine check handling.

---

**CMKH0002E CATASTROPHIC MACHINE CHECK ON I-STREAM aa (CPU bb) OPSW —** *cccccccc cccccccc* **MCIC —** *dddddddd dddddddd* **EDC —** *eeeeeeee* **FSA —** *ffffffff* **IVA —** *gggggggg* **SVA —** *hhhhhhhh* **EVA —** *iiiiiiii* **FLOG —** *jjjjjjjj jjjjjjjj jjjjjjjj jjjjjjjj*

**Where:**

*a...a*
The I-stream number of the machine checked engine.

*b...b*
The CPU address of the machine checked engine.

*c...c* The machine check old PSW.

*d...d*
The machine check interruption code.

*e...e* The external damage code.

*f...f* The failing (absolute) storage address (or zero).

*g···g*
The failing (virtual) storage address in the IVM (optional).

*h...h*
Failing (virtual) storage address in the SVM (optional).

*i...i* Failing (virtual) storage address in the EVM (optional).

*j...j* The fixed logout.

**Explanation:** The machine check FLIH (CPPMKH) issues this message after an irrecoverable machine check.

**System Action:** The TPF system is restarted by CPPMKH.

**User Response:** None.

See *TPF Main Supervisor Reference* and *ESA/390 Principles of Operation* for more information about machine check handling.

---

**CMKH0003E UNRECOVERABLE MACHINE CHECK DAMAGE**

**Explanation:** After an irrecoverable machine check, the machine check FLIH (CCPMKH) issues this message followed by one or more lines that indicate the machine check conditions reported during the machine check interruption.

**System Action:** The TPF system is restarted by CPPMKH.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information about machine check handling.

---

**CMKH0004I RAN OUT OF PATCH FRAMES**

**Explanation:** The machine check FLIH (CPPMKH) issues this message when it runs out of patch frames trying to recover from an uncorrected storage or storage key error.

**System Action:** The TPF system is restarted by CPPMKH.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information about machine check handling.

---

**CMKH0005T INHIBITED CRITICAL RECORD FILING**

**Explanation:** After an irrecoverable machine check, the machine check FLIH (CPPMKH) and the check stop handler (CPPMAL) issue this message when there is reason to believe the critical records would be corrupted if in restarting the TPF system the critical records were filed.

**System Action:** The TPF system is restarted by CPPMKH or CPPMAL without filing the critical records.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information about machine check handling.

---

**CMKH0006A SWITCH TO BACKUP PROCESSING COMPLEX**

**Explanation:** After an irrecoverable machine check, the machine check FLIH (CPPMKH) and the check stop handler (CPPMAL) issue this message when there is reason to believe there is no point in restarting or re-IPLing the current processing complex.

**System Action:** The TPF system is ended by CPPMKH or CPPMAL.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information about machine check handling.

---

**CMKH0007I REACHED CATASTROPHIC MACHINE CHECK THRESHOLD**

**Explanation:** After an irrecoverable machine check, the machine check FLIH (CPPMKH) and the check stop handler (CPPMAL) issue this message when the threshold for irrecoverable machine checks is reached.

**System Action:** The TPF system is ended by CPPMKH or CPPMAL.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information about machine check handling.

---

**CMKH0008A RE-IPL THIS PROCESSING COMPLEX**

**Explanation:** After an irrecoverable machine check, the machine check FLIH (CPPMKH) and the check stop handler (CPPMAL) issue this message when there is some reason to believe there is no point in restarting the TPF system without re-IPLing the current processing complex.

**System Action:** The TPF system is ended by CPPMKH or CPPMAL.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information about machine check handling.

---

**CMKH0009E OVERRAN MACHINE CHECK BUFFER**

**Explanation:** After buffer, the machine check FLIH (CCPMKH) issues this message followed by one or more lines that indicate the machine check conditions reported during the last five machine check interruptions.

**System Action:** The TPF system is restarted by CPPMKH.

**User Response:** See your IBM service representative.

See *TPF Main Supervisor Reference* for more information about machine check handling.

---

**CMKH0010E MALFUNCTION ALERT FROM I-STREAM** *aa* **(CPU** *bb***)**

**Where:**

*aa* The I-stream number of the check stopped engine.

*bb* The CPU address of the check stopped engine.

**Explanation:** The check stop handler (CPPMAL) issues this message when it receives a malfunction alert.

**System Action:** The TPF system is restarted by the CPPMAL.

**User Response:** None.

See *TPF Main Supervisor Reference* and *ESA/390 Principles of Operation* for more information about machine check handling.

---

**CMKH0011E TERMINATED E-TYPE PROGRAM**

**Explanation:** After the machine check FLIH (CCPMKH) ends an E-typeprogram, the machine check SLIH (CMKHRDO) issues this message followed by one or more lines that indicate the machine check conditions reported during the machine check interruption.

**System Action:** The machine check interrupted E-type program is ended by CPPMKH.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information about machine check handling.

---

**CMKH0012E EXTERNAL DAMAGE WITHOUT VALID CODE**

**Explanation:** The machine check SLIH (CMKHRDO) issues this message when it detects a machine check reporting both external damage and external damage code that is not valid.

This is noteworthy because some Sysplex Timer (STR) exceptions are reported as external damage and external damage code that is not valid prevents CMKHRDO from knowing whether any STR exceptions occurred.

**System Action:** None.

**User Response:** None.

See *TPF Main Supervisor Reference* and *ESA/390 Principles of Operation* for more information about machine check handling.

---

**CMKH0013E CYCLING DOWN DUE TO DEGRADATION**

**Explanation:** The machine check SLIH (CMKHRDO) issues this message when it detects a machine check reporting *degradation*, the TPF system is above 1052 state, and cycling is enabled.

**System Action:** The TPF system is cycled down by CMKHRDO.

**User Response:** Do the following:

1. Switch to the backup processing complex.
2. IPl the TPF system again.

See *TPF Main Supervisor Reference* and *ESA/390 Principles of Operation* for more information about machine check handling.

---

**CMKH0014E CYCLING DOWN DUE TO SERVICE PROCESSING DAMAGE**

**Explanation:** The machine check SLIH (CMKHRDO) issues this message when it detects a machine check reporting *service processing damage*, the TPF system is 1052 state, and cycling is enabled.

**System Action:** The TPF system is cycled down by CMKHRDO.

**User Response:** Do the following:

1. Switch to the backup processing complex.
2. IPL the TPF system again.

See *TPF Main Supervisor Reference* and *ESA/390 Principles of Operation* for more information about machine check handling.

---

**CMKH0015E CYCLING DOWN DUE TO WARNING**

**Explanation:** The machine check SLIH (CMKHRDO) issues this message when it detects a machine check reporting *warning*, the TPF system is above 1052 state, and cycling is enabled.

**System Action:** The TPF system is cycled down by CMKHRDO.

**User Response:** Do the following:

1. Switch to the backup processing complex.
2. IPL the TPF system again.

See *TPF Main Supervisor Reference* and *ESA/390 Principles of Operation* for more information about machine check handling.

---

**CMQB0001A LU MESSAGE BLOCKING TABLE FULL, SLOT ALLOCATION FAILED FOR LU** *nnnnnnnn*

**Where:**

*nnnnnnnn*
The logical unit (LU) name.

**Explanation:** Data was transmitted to an LU that supports the general access to the X.25 Transport Extension/Fast Transaction Processing Interface (GATE/FTPI) but no slots are available in the LU message blocking table (LUB). Either no table was allocated or the table is too small.

**System Action:** If no LUB slots are available, data flow continues without taking advantage of the GATE/FTPI message blocking protocol.

**User Response:** Verify that the NBLKLU keyword in the SNAKEY macro used for keypoint record 2 (CTK2) generation specifies a value equal to or greater than the number of GATE/FTPI LUs that can be in session with the TPF system.

---

**CMTN0001I NODE** *xxxxxxxx* **O/P Q HELD**

**Where:**

*xxxxxxxx*
The node.

**Explanation:** The condition causing the failure to the functional support console (FSC) is detected and the queue is held.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the computer room agent set (CRAS) support.

**CMTN0002I NODE *xxxxxxxx* O/P Q RESTARTED**

**Where:**

*xxxxxxxx*
The node.

**Explanation:** The condition causing the failure to the functional support console (FSC) was corrected and the queue that was held previously was restarted.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the computer room agent set (CRAS) support.

**CMWA0001I *xxxxxxxx* PACING LIMIT REACHED, CURRENT VALUE — *n***

**Where:**

*xxxxxxxx*
FMMR name

*n* The current pacing value.

**Explanation:** Either the functional management message router (FMMR) session has pacing count errors or the pacing window is exhausted.

**System Action:** None.

**User Response:** Have your system programmer determine the cause of the error and correct it.

**CNCE0001E CYCLING DOWN DUE TO EXCESSIVE CHANNEL CHECKS**

**Explanation:** The channel check handler (CNCEX1) issues this message when the threshold for channel checks is reached, the TPF system is above 1052 state, and cycling is enabled.

**System Action:** The TPF system is cycled down by CNCEX1.

**User Response:** Do the following:

1. Switch to the backup processing complex
2. IPL the TPF system again.

See *TPF Main Supervisor Reference* and *ESA/390 Principles of Operation* for more information about machine check handling.

**CNCE0002E *aaaa* DEVICES ADDED, *bbbb* DEVICES DELETED**

**Where:**

*aaaa*
The number of devices added to the input/output (I/O) configuration.

*bbbb*
The number of devices deleted from the I/O configuration.

**Explanation:** The channel report word handler (CNCEX9) issues this message when one or more channel report words report one or more devices added or deleted from the I/O configuration.

**System Action:** None.

**User Response:** None.

See *TPF Main Supervisor Reference* and *ESA/390 Principles of Operation* for more information about machine check handling.

**CNCE0003E OVERRAN CRWS**

**Explanation:** The channel report word handler (CNCEX9) issues this message when CRWs are reported overrun. This is noteworthy because:

- Overrun CRWs are not logged
- The overrun CRWs may have reported channel subsystem problems or changes within the I/O configuration.

**System Action:** None.

**User Response:** None.

See *TPF Main Supervisor Reference* and *ESA/390 Principles of Operation* for more information about machine check handling.

**CNE00101E LEID *xxxxxx* IS UNKNOWN**

**Where:**

*xxxxxx*
The logical end-point identifier (LEID).

**Explanation:** The TPF system received a message from a NEF, the AX.25, or the XALCI device whose logical end-point identifier (LEID) is not in the WGTA.

**System Action:** An OPR-1E8 dump is issued and the ECB is exited.

**User Response:** Have your system programmer review the system error dump to determine the cause of the error and to correct it.

**CNFC0001E LEID *xxxxxx* IS UNKNOWN**

**Where:**

*xxxxxx*
The logical end-point identifier (LEID).

**Explanation:** The TPF system received an error report from NEF indicating that a message was sent to a logical end-point identifier (LEID) that is not defined in the network control program (NCP) NEF tables.

**System Action:** Indicates that the terminal is not in service.

**User Response:** Have your system programmer review the system error dump to determine the cause of the error and to correct it.

**CNFC0002I LEID *xxxxxx* IS INACTIVE**

**Where:**

*xxxxxx*
The logical end-point identifier (LEID).

**Explanation:** The TPF system is trying to send a message to a NEF2 logical end-point identifier (LEID) that is not active.

**System Action:** Indicates that the terminal is not in service.

**User Response:** Determine whether the terminal is powered

on or whether there is any other malfunction.

---

**CNFC0003I LEID *xxxxxx* WAS PREVIOUSLY ASSOCIATED WITH ANOTHER LU**

**Where:**

*xxxxxx*
The logical end-point identifier (LEID).

**Explanation:** The terminals associated with a SNA logical unit (LU) have changed.

**System Action:** None.

**User Response:** Enter the ZTERM command to see whether this LEID is switched to another NEF LU.

---

**CNIS0001I UP MODE IS SET FOR NEXT IPL**

**Explanation:** Only one I-stream in the processor is set to be active for the next IPL.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCNIS command.

---

**CNIS0002I MP MODE IS SET FOR NEXT IPL**

**Explanation:** All of the I-streams in the processor are set to be active for the next IPL.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCNIS command.

---

**CNIS0003I CURRENTLY RUNNING IN MP MODE**

**Explanation:** All I-streams in the processor are active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCNIS command.

---

**CNIS0004I CURRENTLY RUNNING IN UP MODE**

**Explanation:** Only one I-stream in the processor is active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCNIS command.

---

**CNIS0020W MP REQUEST INVALID FOR UNI PROCESSOR SYSTEM**

**Explanation:** The operator requested for all (more than one) I-streams to be active for the next IPL. However, there is only one I-stream in the processor capable of being activated by the TPF system. Therefore, the MP mode request is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCNIS command.

---

**CNIS0051E INVALID INPUT FORMAT — ENTER '?' OR 'HELP' FOR VALID PARAMS**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCNIS command.

---

**CNIS0052E PTV ACTIVE – CANNOT PROCESS MP REQUEST**

**Explanation:** MP mode was requested by the operator while the program test vehicle (PTV) was still active. PTV can only run in UP mode.

**System Action:** None.

**User Response:** Do the following:

1. Deactivate PTV.
2. Enter the command again.

See *TPF Operations* for more information about the ZCNIS command.

---

**CNIS0053E CTKI RETRIEVAL TIMEOUT, DASD RECORD HOLD TABLE**

**Explanation:** CNBA failed to retrieve CTKI with HOLD after 2 seconds. Therefore, CTKI is assumed to be held already, probably by some other processor in the complex.

**System Action:** None.

**User Response:** Enter the ZRHLD DISPLAY command to display the control locks to determine who is holding CTKI and then try to clear the hold.

If some other processor is hung while holding the keypoint, then that processor should be deactivated by entering the ZPSMS PR DEACTIVATE *pr* command.

**Note:** FORCE DEACTIVATE should be used with extreme discretion.

If some processor is waiting for RTx tape mount then CTKI will be held.

See *TPF Operations* for more information about the ZCNIS and ZPSMS commands.

---

**CNIS0054E UNABLE TO RETRIEVE CTKI — REQUEST NOT PROCESSED**

**Explanation:** Keypoint I could not be retrieved by using the CYYC keypoint retrieval program to update the CPU field to indicate UP or MP mode for the next IPL.

**System Action:** A system error is issued.

**User Response:** Give the system console sheet and dump to your system support personnel.

See *TPF Operations* for more information about the ZCNIS command.

---

**CNIS0055E CTKI I/O ERROR — REQUEST NOT PROCESSED**

**Explanation:** An input/output (I/O) error occurred when trying to retrieve CTKI to update the CPU field to indicate UP or MP mode for the next IPL.

**System Action:** A system error is issued.

**User Response:** Give the system console sheet and system error dump your system support personnel.

See *TPF Operations* for more information about the ZCNIS command.

---

**CNIS0056E UNABLE TO FILE CTKI — REQUEST NOT PROCESSED**

**Explanation:** An error occurred while filing CTKI with the updated CPU field. Therefore, the CPU field in CTKI did not get updated.

**System Action:** A system error is issued.

**User Response:** Review the entry control block (ECB) SUD flag byte for data level 1 and determine the reason for the failure.

See *TPF Operations* for more information about the ZCNIS command.

---

**CNIS0060E UNABLE TO RETRIEVE CTKA – REQUEST NOT PROCESSED**

**Explanation:** Keypoint A could not be retrieved by using the CYYC keypoint retrieval program. Keypoint A was retrieved to update or display the I-stream scheduler constants.

**System Action:** A system error is issued.

**User Response:** Give the system console sheet and dump to your system support personnel.

See *TPF Operations* for more information about the ZCNIS command.

---

**CNIS0061E UNABLE TO FILE CTKA — REQUEST NOT PROCESSED**

**Explanation:** An error occurred while filing CTKA with the updated MAXQ or REACT parameter. This prevents updating of the file copy of the parameter. The main storage copy of the field is, however, updated with the new data.

**System Action:** A system error is issued.

**User Response:** Review the entry control block (ECB) SUD flag byte for data level 1 and determine the reason for the failure.

See *TPF Operations* for more information about the ZCNIS command.

---

**CNIS0062I I-STREAM SCHEDULER CONSTANTS: REACT-*nn*, MAXQ-*nn***

**Explanation:** This is an informational display of the I-stream scheduler constants. It was caused by a ZCNIS DISPLAY, ZCNIS MAXQ-, or ZCNIS REACT- command.

**Where:**

*nn* The 8 hexadecimal digits that give the current value or the maximum queue value or the reaction time parameter used by the I-stream scheduler.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCNIS command.

---

**CNOM0001E IPC WAIT ERROR, XMIT TO PROC *x***

**Where:**

*x* The processor name.

**Explanation:** The timeout period for the queued output messages expired. Connections were not established with interprocessor communications (IPC) in an active processor.

**System Action:** All queued system interprocessor communications (SPIC) items for that processor are returned to the originating user or discarded.

**User Response:** Determine why there was a failure to establish the connections.

---

**CNOM0002W IPC QUEUE TO PROC *x* HAS REACHED A HIGH LEVEL, CURRENT LEVEL =*xxxxx***

**Where:**

*x* The processor name.

*xxxxx*
The current level of the queue.

**Explanation:** The interprocessor communications (IPC) output queue contains greater than a multiple of CNOSWRN messages since the last time a multiple of CNOSWRN was reached or dropped to (CNOSWRN is defined in the change number of sessions (CNOS) segment). The current level of the queue is referenced in the message.

**System Action:** A warning message is issued.

**User Response:** Determine why messages are being placed on the IPC queue and provide an opportunity to detect stalled IPC traffic to a processor.

---

**CNON0001I IPC RESTART COMPLETED.**

**Explanation:** Interprocessor communications (IPC) restart processing completed.

**System Action:** Control is returned to the Restart Scheduler (CTKS).

**User Response:** None.

---

**CNOP0002I IPC WAITING FOR CONNECTIONS TO ALL L/C PROCS**

**Explanation:** This is an informational message. It indicates that restart processing is waiting until interprocessor communications (IPC) have established connections with all the processors in the loosely coupled complex.

**System Action:** When all required connections are established, CNOQ or CNOR runs POSTC to reinitiate restart processing.

**User Response:** None.

**CNOP0051E IPC TIMEOUT — CONNECTIONS NOT COMPLETED TO ALL L/C PROCESSORS**

**Explanation:** This error occurs during restart if the connections for all loosely coupled processors in the complex were not completed within the time specified on the ZSIPC ALTER RESTART command.

**System Action:** Restart is continued.

**User Response:** None.

**CNOQ0002I IPC CONNECTION ESTABLISHED TO PROCESSOR** *x*

**Where:**

*x* The processor name.

**Explanation:** This is an informational message. It indicates that a connection was established with the specified processor.

**System Action:** The interprocessor communications (IPC) processor activation is completed.

**User Response:** None.

**CNOR0002I IPC CONNECTION ESTABLISHED TO PROCESSOR** *x*

**Where:**

*x* The processor name.

**Explanation:** This is an informational message. It indicates that a connection was established with the specified processor.

**System Action:** The interprocessor communications (IPC) processor activation is completed.

**User Response:** None.

**CNOR0050E IPC CONNECTION REQUEST TO SYSTEM** *ssssssss* **FAILED WITH ERROR CODE** *xxxxxxx*

**Where:**

*ssssssss*
The TPF system name.

*xxxxxxx*
The error code.

**Explanation:** The CONNECT request was not accepted by the TPF systemnamed in the message.

**System Action:** The TPF system resources associated with the CONNECT attempt are released.

**User Response:** Determine why there was a failure to establish the connections.

**CNOS0050E IPC WAIT ERROR, XMIT TO PROC** *x*

**Where:**

*x* The processor name.

**Explanation:** The timeout period for queued output messages expired. Connections were not established with the interprocessor communications (IPC) in an active processor.

**System Action:** All queued system interprocessor communications (IPC) items for that processor are returned to the originating user or discarded.

**User Response:** Determine why there was a failure to establish the connections.

# CNPA–CORO

**CNPA0001I SIPC LOCKNAMES INITIALIZED FOR DATA SET** *xx*

**Where:**

*xx* The interprocessor communications (IPC) data set name.

**Explanation:** This message confirms that all lock names associated with the interprocessor communications (IPC) date set referenced in the message for all processors defined for the loosely coupled environment, were initialized.

**Note:** The lock names are only initialized the first time the data set is activated by any processor.

**System Action:** None.

**User Response:** None.

**CNPB0001W SICF DS** *xx* **INACTIVE DUE TO PREVIOUS REQUEST**

**Where:**

*xx* The data set name.

**Explanation:** Interprocessor communications (IPC) restart determined that the data set referenced in the message is inactive because the operator previously entered the ZSIPC command to deactivate the data set *xx* for this processor.

**System Action:** IPC tries to initialize the other data set. If that data set is also inactive, restart does the following:

- Ends, if there are other active processors (CTL-295)
- Proceeds in uniprocessor mode with IPC inoperative (CNP80002W).

**User Response:** Do the following:

1. Enter the ZSIPC command to activate the data set.
2. If the restart was ended, IPL the TPF system.

**CNPB0001W SICF DS *xx* INACTIVE DUE TO UNAVAILABLE VOLUME**

**Where:**

*xx* The data set name.

**Explanation:** Interprocessor communications (IPC) restart determined that the data set referenced in the message is inactive because the volume associated with that data set was not logically mounted prior to the current IPL.

**System Action:** IPC tries to initialize the other data set. If that data set is also inactive, restart does the following:

- Ends, if there are other active processors (CTL-295)
- Proceeds in uniprocessor mode with IPC inoperative (CNP80002W).

**User Response:** Do one of the following procedures, as appropriate:

1. Enter the ZFMNT command to mount the volume.
2. If the alternate data set is active, enter the ZSPIC command to activate the data set *xx*.

1. IPL the TPF system again.

---

**CNPB0001W SICF DS *xx* INACTIVE DUE TO PREVIOUS STATUS**

**Where:**

*xx* The data set name.

**Explanation:** Interprocessor communications (IPC) restart determined that the data set referenced in the message is inactive because it experienced an input/output (I/O) error that caused it to be deactivated.

**System Action:** IPC tries to initialize the other data set. If that data set is also inactive, restart does the following:

- Ends, if there are other active processors (CTL-295)
- Proceeds in uniprocessor mode with IPC inoperative (CNP80002W).

**User Response:** Do one of the following:

- If the alternate data set is active, enter the ZSIPC command to activate the data.
- IPL the TPF system again

---

**CNPR0000I SIGT TABLES INITIALIZED**

**Explanation:** The system interprocessor global tables (SIGT) were initialized.

**System Action:** After the message is issued, return is made from CNPT to the TPF system restart program.

**User Response:** None.

---

**CNPR0001E FACE ERROR, ID=SGFRI ORDINAL NUMBER *num*, (SSU *ssu*)**

**Where:**

*num*
The ordinal number.

*ssu* The subsystem user (SSU).

**Explanation:** A file address compute program (FACE) error occurred when trying to calculate the address of a SGFR record. This message is for the multiple database function (MDBF) only.

**System Action:** After the message is issued, return is made to CNPS and ultimately to CNPR where the subsystem user (SSU) is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

---

**CNPR0002E FIND ERROR, ID GE ORDINAL NUMBER *num*, ADDRESS *addr*, (SSU *ssu*)**

**Where:**

*num*
The ordinal number.

*addr*
The address.

*ssu* The subsystem user (SSU).

**Explanation:** An error occurred when a FIND was issued for a SGFR record. This message is for the multiple databasefunction (MDBF) only.

**System Action:** After the message is issued, return is made to CNPS and ultimately to CNPR where the subsystem user (SSU) is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

---

**CNPR0003E SIGT RETRIEVE ERROR FOR SS *ss* SS NOW DORMANT**

**Where:**

*ss* The subsystem name.

**Explanation:** An error occurred when retrieving the system interprocessor global table (SIGT). This message is for the multiple databasefunction (MDBF) only.

**System Action:** After the message is issued, return is made to CNPS and ultimately to CNPR where the subsystem (SS) is placed in a dormant state. Processing is continued with the next SS.

**User Response:** None.

---

**CNPR0004E ERROR FILING SIGT FOR SS *ss* SS NOW DORMANT**

**Where:**

*ss* The subsystem name.

**Explanation:** An error occurred when filing the system interprocessor global table (SIGT). This message is for the multiple databasefunction (MDBF) only.

**System Action:** After the message is issued, return is made to CNPS and ultimately to CNPR where the subsystem (SS) is placed in a dormant state. Processing is continued with the next SS.

**User Response:** None.

---

**CNPR0005I ALL SUBSYSTEM USERS FOR *ssid* NOW DORMANT**

**Where:**

*ssid* A subsystem ID with a maximum of 4 characters.

**Explanation:** The first subsystem user (SSU) in a subsystem was found to be in a dormant state. The first SSU in a subsystem must be available since this is where all common records are located.

**System Action:** After the message is issued control is returned to CNPR. CNPR places the SSU in a dormant state. If any other SSUs in this subsystem have common records, they are also placed in a dormant state.

Processing is continued with the next SSU.

**User Response:** None.

**COAE0000A FMMR PATH TO CPU *x* UNAVAILABLE.**

**Where:**

*x* The CPU ID.

**Explanation:** An application program issued a ROUTC macro to a terminal or an application program in a remote central processing unit (CPU) and the FMMR session with that CPU is inactive.

**System Action:** The output message is queued or it is returned to the application program.

**User Response:** Enter the ZNETW ACT command to activate the FMMR session to the destination CPU.

See *TPF Operations* for more information about the ZNETW ACT command.

**COMT0099A FAILURE TO FSC ON *xxxxxx* — QUEUE HELD**

**Where:**

*xxxxxx*
The pseudo line number, interchange address, and terminal address (LNIATA).

**Explanation:** The output message transmitter (OMT) timed out for the device with the pseudo LNIATA referenced in the message. The device that timed out is currently defined as a functional support console (FSC).

**System Action:** No further transmission to the device is attempted by the OMT. The queue is held.

All messages subsequently sent to the device are placed on the queue.

**User Response:** Do one of the following:

- To prevent a build up of messages on the queue, enter the ZACRS command to either:
  - Delete the FSC assignments for the device (which will swing the queue to the RO)
  - Assign a new FSC to replace the failing device (which will swing the queue to the new FSC).
- You can enter the ZDCRS CONS command to display the current FSC assignments.
- Check the hardware configuration to ensure that the device is operational. You can do so by entering the ZNDLU command. If the device is not operational, either a SNA sense or an LUSTAT with the reason for the failure was received from the Network Control Program (NCP).
- Check the path information unit (PIU) trace and consult *IBM Systems Network Architecture Format and Protocol Reference Manual: Architectural Logic* for more information about the failure.

When the condition causing the failure is corrected (such as loading paper), the device signals its availability and the queue restarted automatically. At this time, notification is sent to you through a NODE *xxxxxxxx* O/P Q RESTARTED message.

See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

**CORA0208E *CP* *nnnn* DEVICE *cuu* VSN *vvvvvv* NOT IN LIBRARY**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The volume serial number (VSN) referenced in the message is not in the library.

**System Action:** The TPF system ends the library function that requested the volume.

**User Response:** Do the following:

1. Add the volume to the library.
2. Enter the command again.

**CORA0216W *CP* *nnnn* DEVICE *cuu* VSN *vvvvvv* CLEANER VOLUME EJECTED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** A cleaner volume has exceeded its maximum usage count and was ejected.

**System Action:** The warning message is sent to you.

**User Response:** Remove the cleaner volume.

**CORA0231E *CP* *nnnn* DEVICE *cuu* CATEGORY EMPTY**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library function that was requested was rejected because there are no volumes associated with the category.

**System Action:** A library function was started and the status returned was that no volumes were associated with the category.

**User Response:** Do one of the following:

- If the correct category was specified, add volumes if needed.
- If an incorrect category was specified, enter the command again and specify the correct category.

---

**CORA0233E** ***CP*** *nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **MISPLACED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The ZTPLF command that was entered was rejected because the volume serial number (VSN) that was specified is in the library inventory but is flagged as misplaced.

**System Action:** The operation is ended.

**User Response:** Determine why the volume is misplaced.

---

**CORA0239E** ***CP*** *nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **INACCESSIBLE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The library function cannot be completed successfully because the volume serial number (VSN) referenced in the message is inaccessible.

**System Action:** The operation is ended.

**User Response:** Determine why the volume is inaccessible.

---

**CORA0241I** *nnnn* **TAPE LIBRARY OPERATOR MESSAGE**
*ttttttttttttttttttttttttttttttttt*
*ttttttttttttttttttttttttttttttttt*

**Where:**

*nnnn*
The subsystem user (SSU) name.

*t...t* Free format text.

**Explanation:** This is a free format unsolicited message from the library operator's console. This message can be up to 70 characters long.

**System Action:** The TPF system sends the message to the library operator's console.

**User Response:** None.

---

**CORA0242E** ***CP*** *nnnn* **DEVICE** *cuu* **ORDER SEQUENCE CHECK**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** A library request to load a volume was rejected because the device referenced in the message:

- Is loaded without a pending unload operation
- Has another load request queued
- Has a load in progress.

**System Action:** The TPF system ends the library function.

**User Response:** Determine why an attempt was made to load the volume when the status of the device prevented it.

---

**CORA0245E** ***CP*** *nnnn* **DEVICE** *cuu* **VISION SYSTEM NOT OPERATIONAL**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library function was rejected because the library vision system is not operational.

**System Action:** None.

**User Response:** Determine why the vision system is not operational.

---

**CORA0247E** ***CP*** *nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **NOT READABLE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN) that the library expected to use for the function.

**Explanation:** The library function failed because the vision system could not validate the volume serial number (VSN) of the volume because the label was unreadable or not present at the time the function was attempted.

**System Action:** The TPF system ends the library function that found the error.

**User Response:** Do the following:

1. Eject the cartridge.
2. Replace or affix an external label to the cartridge.

---

**CORA0248W** ***CP*** *nnnn* **DEVICE** *cuu* **FUNCTION CANCELED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library function was canceled because of a library cancel order.

**System Action:** The TPF system ends the library function that found the error.

**User Response:** Do the following:

1. Determine why the function was aborted.
2. Try the entry again, if you want.

---

**CORA0249E** ***CP*** *nnnn* **DEVICE** *cuu* **LIBRARY HARDWARE FAILURE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The ZTPLF command that was entered failed because of a library hardware failure condition at the time the function was attempted.

**System Action:** The TPF system ends the library function that found the error.

**User Response:** Do the following:

1. Determine the cause of the hardware failure.
2. Repair actions may be required.

---

**CORA0250E** ***CP*** *nnnn* **DEVICE** *cuu* **NO LONGER AVAILABLE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library function failed because the device requested is no longer available to the library.

**System Action:** The TPF system ends the library function that found the error.

**User Response:** Repeat the entry on a different device.

---

**CORA0251E** ***CP*** *nnnn* **DEVICE** *cuu cuu* **UNRECOVERABLE LOAD FAILURE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library function failed because the device requested had an unrecoverable load failure while trying to perform the function.

**System Action:** The TPF system ends the library function that found the error.

**User Response:** Try the entry again. If the same error is received, repeat the entry on a different device.

---

**CORA0258E** ***CP*** *nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **MOVED FROM MANUALLY EJECT TO PURGE CATEGORY**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The library detected a volume in the manually ejected category and moved it to the purge category.

**System Action:** The volume is moved to the purge category and the function that is requesting the volume is ended.

**User Response:** Determine why the volume was left in the manually ejected category.

---

**CORA0260E** ***CP*** *nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **DAMAGED CARTRIDGE EJECTED FROM LIBRARY**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The library determined that the cartridge was damaged in such a way that it could not be loaded on a device. The cartridge was ejected from the library.

**System Action:** None.

**User Response:** Do the following:

1. Remove the cartridge from the output station.
2. Inspect the cartridge.
3. Replace or repair the cartridge.
4. Enter the cartridge into the library again.

---

**CORA0261E** ***CP*** *nnnn* **DEVICE** *cuu* **DEVICE** *cuu* **OPERATION CANCELED LIBRARY ENTERED MANUAL MODE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library function was canceled because the automated tape library entered manual mode after the operation was queued and the requested function is not allowed in manual mode.

**System Action:** The TPF system ends processing of the library function.

**User Response:** Try the function again when the library returns to automated mode.

---

**CORA0267I** ***CP* *nnnn* DEVICE *cuu* BULK INPUT/OUTPUT ALLOWED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The bulk input/output is allowed.

**System Action:** None.

**User Response:** The volumes can now be added to or removed from the bulk input or output stations.

---

**CORA0270I** ***CP* *nnnn* DEVICE *cuu* LIBRARY AUTOMATED STATE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library is in automated operational state.

**System Action:** None.

**User Response:** The library functions that require the library to be in automated state can now be preformed.

---

**CORA0272W** ***CP* *nnnn* DEVICE *cuu* LIBRARY MANUAL MODE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library is in manual mode operational state.

**System Action:** None.

**User Response:** Do the following:

1. Wait for the library to return to automated mode.
2. Perform the library functions that require the library to be in automated mode.

---

**CORA0273W** ***CP* *nnnn* DEVICE *cuu* LIBRARY IN DEGRADED MODE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** Some elements of the library have failed and the managed tape library is operating in a degraded mode of operation.

**System Action:** None.

**User Response:** Do the following:

1. Check the library manager to determine which elements failed.
2. Repair actions may be required.

---

**CORA0274E** ***CP* *nnnn* DEVICE *cuu* LIBRARY SAFETY INTERLOCK OPEN**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library safety interlock was opened.

**System Action:** None.

**User Response:** If you want, close the library safety interlock.

---

**CORA0275E** ***CP* *nnnn* DEVICE *cuu* LIBRARY OFFLINE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library manager is offline and will not accept library operation requests.

**System Action:** None.

**User Response:** Library repair actions may be required.

---

**CORA0282E** ***CP* *nnnn* DEVICE *cuu* LIBRARY IN MANAGED MANUAL MODE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library is in the managed manual mode state.

**System Action:** None.

**User Response:** Do one of the following:

- Verify that the library should be in manual mode
- Repair actions may be required.

---

**CORA0290I** ***CP* *nnnn* DEVICE *cuu* LIBRARY FUNCTION COMPLETED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library function was completed successfully but the waiting ECB is no longer present to issue the completion message.

**System Action:** The TPF system sends a completion message to you.

**User Response:** Query the status of the device to determine which operation was in progress.

---

**CORB0289I** *ffff nnnn* **VSN** *vvvvvv* **AUTO MOVED FROM** *cat1* **TO** *cat2*

**Where:**

*ffff* The function identifier.

*nnnn*
The subsystem user (SSU) name.

*vvvvvv*
The volume serial number (VSN).

*cat1*
The old category.

*cat2*
The new category.

**Explanation:** The category for a volume was changed by an internal TPF request.

**System Action:** The category for the volume was changed.

**User Response:** If you have a tape catalog that tracks this information, update it to indicate that the volume is now in the category indicated.

---

**CORC0289I** *ffff nnnn* **VSN** *vvvvvv* **AUTO MOVED FROM** *cat1* **TO** *cat2*

**Where:**

*ffff* The function identifier.

*nnnn*
The subsystem user (SSU) name.

*vvvvvv*
The volume serial number (VSN).

*cat1*
The old category.

*cat2*
The new category.

**Explanation:** The category for a volume was changed by an internal TPF request.

**System Action:** The category for the volume was changed.

**User Response:** If you have a tape catalog that tracks this information, update it to indicate that the volume is now in the category indicated.

---

**CORD0205I** **TPLF** *nnnn* **VSN** *vvvvvv* **LOADED ON** *cuu* **FROM CAT-***catg*

**Where:**

*nnnn*
The subsystem user (SSU) name.

*vvvvvv*
The volume serial number (VSN). `*NONE*` is displayed if the volume was unloaded before the load completed.

*cuu* The device address.

*catg*
The category of the volume mounted.

**Explanation:** The volume was loaded successfully to the device.

**System Action:** The volume was loaded to the specified device address.

**User Response:** If you have a tape catalog that tracks this information, update it to indicate that the volume is now loaded on the specified device.

---

**CORD0207E** **TPLF** *nnnn* **VSN** *vvvvvv* **SOURCE CATEGORY MISMATCH**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The ZTPLF LOAD or the ZTPLF MOVE command that was entered was rejected because the category specified is not the same as the category of the volume.

**System Action:** The volume specified cannot be used. The device status remains unchanged. No action is taken.

**User Response:** Enter the command again and specify the correct category and volume serial number (VSN).

---

**CORD0209E** **TPLF** *nnnn* **NO LIBRARY ATTACHED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

**Explanation:** The function was not performed because there is no library attached.

**System Action:** The library function was not preformed.

**User Response:** The entry is not correct for the current system configuration.

---

**CORD0210I** **TPLF** *nnnn* **CATEGORY** *catg* **ASSIGNED to** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name.

*catg*
The library FILL category.

*cuu* The device address.

**Explanation:** The FILL category specified is now associated with the device.

**System Action:** The device is associated with the FILL category. The cartridge loader is filled with volumes from the category as long as there are more volumes in the category.

**User Response:** None.

---

**CORD0211E TPLF *nnnn* CATEGORY RESTRICTED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

**Explanation:** The category is reserved and cannot be used for this function. This occurs when the volume serial number (VSN) specified is assigned to the Cleaner-Volume category.

**System Action:** Processing is ended.

**User Response:** Select a volume that is not in the Cleaner-Volume category.

---

**CORD0214I TPLF *nnnn* VSN *vvvvvv* REMOVED FROM *cuu***

**Where:**

*nnnn*
The subsystem user (SSU) name.

*vvvvvv*
The volume serial number (VSN).

*cuu* The device address.

**Explanation:** The volume was unloaded successfully from the device. This message is issued after a successful unload without the ALL parameter or if the ALL parameter was specified and the device is not associated with a FILL category.

**System Action:** The volume was unloaded from the device.

**Note:** If the device is associated with a FILL category, the next volume is loaded automatically to the device.

**User Response:** If you have a tape catalog that tracks this information, update it to indicate that the volume is no longer loaded on the specified device.

---

**CORD0215I TPLF *nnnn* FILL CAT *catg* DELETED FROM *cuu* ALL VOLUMES REMOVED FROM ACL VSN *vvvvvv* REMOVED FROM DEVICE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*catg*
The library FILL category.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN) of the volume is displayed if a volume is removed from the device. `*NONE*` is displayed if a volume is not removed from the device.

**Explanation:** All volumes were removed from the device and the automatic cartridge loader (ACL). The FILL category is no longer associated with the device.

**System Action:** The volumes are unloaded from the device and the ACL. The device is no longer associated with the FILL category.

**User Response:** None.

---

**CORD0218I TPLF *nnnn* CAT *catg* RESERVED for *hostname.***

**Where:**

*nnnn*
The subsystem user (SSU) name.

*catg*
The category.

*hostname*
The token host name for this TPF system.

**Explanation:** A new category is now reserved for this TPF system.

**System Action:** A request was issued to the tape library manager to reserve a category for the TPF system.

**User Response:** This category can now be used for library requests.

---

**CORD0220E TPLF *nnnn* INVALID FORMAT**

**Where:**

*nnnn*
The subsystem user (SSU) name.

**Explanation:** The format of the command is not valid.

**System Action:** The ZTPLF command that was entered was rejected.

**User Response:** Do the following:

1. Verify the proper format of the command.
2. Enter the ZTPLF command again.

---

**CORD0221E TPLF *nnnn* DEVICE *cuu* NOT CONFIGURED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The device is not configured in the TPF system.

**System Action:** The ZTPLF command that was entered was not performed.

**User Response:** Do one of the following:

- If the device address is correct, vary the device online.
- Enter the ZTPLF command again and specify a device that is varied online to this TPF system.

---

**CORD0222E TPLF *nnnn* DEVICE *cuu* IN USE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library function cannot be performed because the specified device is in use.

**System Action:** Processing for the ZTPLF command is ended and the device is left unchanged.

**User Response:** Do one of the following:

- Choose another device and enter the ZTPLF command again
- Wait for the device to become free and enter the ZTPLF command again.

---

**CORD0223I TPLF** *nnnn* **CATEGORY** *catg* **RELEASED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*catg*
The category.

**Explanation:** The category is released and can be reserved by this or another operating system that shares the library.

**System Action:** A previously reserved category was released.

**User Response:** Remove this category from the list of those available for this TPF system.

---

**CORD0226I TPLF** *nnnn* **VSN** *vvvvvv* **MOVED FROM** *cat1* **TO** *cat2*

**Where:**

*nnnn*
The subsystem user (SSU) name.

*vvvvvv*
The volume serial number (VSN).

*cat1*
The *from* category.

*cat2*
The *to* category.

**Explanation:** A specific volume was removed from one category to another.

**System Action:** The volume was moved from one category to another.

**User Response:** If you have a tape catalog that tracks this information, update it to indicate that this volume is now in the category indicated.

---

**CORD0227I TPLF** *nnnn* **STATUS FOR DEVICE** *cuu* **VSN-***vvvvvv* **CAT-***catg* **FILL-***typfil* **ACL-***acstat*

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN), if a volume is loaded. Otherwise, `*NONE*` is displayed.

*catg*
The FILL category. Otherwise, it is left blank.

**Note:** The category will not necessarily be equal to the category of the volume that is currently mounted.

*typfil*
One of the following:

**AUTO**
If automatic fill is active on this device.

**SEQ**
If sequential automatic fill is active on this device.

**NO**
If automatic fill is not active on this device.

*acstat*
One of the following:

**EMPTY**
If the automatic cartridge loader (ACL) is installed but empty.

**ACTIVE**
If the ACL is installed and least one cartridge is in the input stack.

**NO**
If the ACL is not installed.

**Explanation:** This display provides the library status information for a specific device.

**System Action:** None.

**User Response:** None.

---

**CORD0228I TPLF** *nnnn numvol* **VOLUMES FOR CATEGORY** *catg* **VOLUMES** *sortstat* **STARTING CATEGORY SEQUENCE NUMBER –** *zzzzzzz1 vvvvvv vvvvvv vvvvvv vvvvvv vvvvvv vvvvvv vvvvvv vvvvvv vvvvvv vvvvvv vvvvvv vvvvvv vvvvvv vvvvvv vvvvvv vvvvvv* **LAST CATEGORY SEQUENCE NUMBER –** *zzzzzzz2* **END OF DISPLAY**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*numvol*
The number of volumes in the category.

*catg*
The category.

*sortstat*
SORTED or UNSORTED.

*vvvvvv*
The volume serial number (VSN) in the category.

*zzzzzzz1*
If this line is displayed, it contains the starting sequence number that was used to display the volumes in the category.

*zzzzzzz2*
If this line is displayed, it contains the next sequence number that should be used to display more volumes in the category.

**Explanation:** This display provides the list of volumes that are in a specific category.

**System Action:** None.

**User Response:** None.

---

**CORD0229I** **TPLF** *nnnn numcat* **CATEGORIES HOST–***hostname* **STARTING CATEGORY –** *zzz1 cccc cccc cccc cccc cccc cccc cccc cccc cccc cccc cccc cccc* **LAST CATEGORY –** *zzz2* **END OF DISPLAY**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*numcat*
The number of categories reserved by the host system.

*hostname*
The token host name.

*cccc*
The category.

*zzz1*
If this line is displayed, it contains the starting category that was used to display the categories reserved for the specified host system.

*zzz2*
If this line is displayed, it contains the category that should be used to display more categories for the specified host system.

**Explanation:** This display provides the categories reserved by a specified host system.

**System Action:** The reserved category data is displayed.

**User Response:** None.

---

**CORD0230I** **TPLF** *nnnn* **STATUS FOR VSN** *vvvvvv* **CAT–***catg* **STATUS–***volstat*

**Where:**

*nnnn*
The subsystem user (SSU) name.

*vvvvvv*
The volume serial number (VSN).

*catg*
The category assigned to the volume.

*volstat*
The status information:

**AVAILABLE**
The volume is in the library with no error conditions noted.

**INACCESSIBLE**
The volume is in library, but inaccessible.

**LOADED**
The volume is loaded.

**QUEUED FOR LOAD**
The volume is queued for load.

**BEING LOADED**
The volume is in the process of being loaded.

**QUEUED FOR UNLOAD**
The volume is queued for unload.

**BEING UNLOADED**
The volume is in the process of being unloaded.

**QUEUED FOR EJECT**
The volume is queued for eject.

**BEING EJECTED**
The volume is in the process of ejection.

**QUEUED FOR AUDIT**
The volume is queued for audit.

**BEING AUDITED**
The volume is in the process of auditing.

**MISPLACED**
The volume is misplaced.

**INVALID LABEL**
The volume has an unreadable label or is unlabeled.

**USED IN MANUAL MODE**
The volume was used during manual mode.

**MANUALLY EJECTED**
The volume was ejected manually.

**???????.....???????**
The volume status cannot be determined.

**Explanation:** This display provides the status of a specific volume.

**System Action:** None.

**User Response:** None.

---

**CORD0236E** **TPLF** *nnnn* **NO RESERVED CATEGORIES –** *hostname*

**Where:**

*nnnn*
The subsystem user (SSU) name.

*hostname*
The token host name for this host system.

**Explanation:** None.

**System Action:** A message is sent indicating that there are no categories reserved for the host system specified.

**User Response:** None.

---

**CORD0254E** **TPLF** *nnnn funcparm* **LIBRARY FUNCTION FAILED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*funcparm*
The ZTPLF command entered.

**Explanation:** The ZTPLF command that was entered did not complete successfully.

**System Action:** The ZTPLF command was not performed.

**User Response:** If this message is received in response to the ZTPLF RESERVE or RELEASE command, the reserve and release category functions are not supported for your release of the tape library dataserver.

Otherwise, check the library error messages that were issued prior to this error message to determine why the order failed.

**CORD0265E TPLF *nnnn* DEV-*cuu* PLF *funcparm* TERMINATED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*funcparm*
The ZTPLF command entered.

**Explanation:** The ZTPLF LOAD, UNLOAD, or MOVE command was ended by the TPF system. The TPF system did not receive a reply from the library that the function had completed. Further checks indicate that the device is no longer varied online or the request is no longer queued for execution in the library.

**System Action:** The device is left unchanged after the time out.

**User Response:** Check the status of the device to determine why the operation was canceled.

**CORD0287E TPLF *nnnn* CATEGORY *catg* ALREADY ASSIGNED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*catg*
The category that is currently assigned to the device.

**Explanation:** The ZTPLF FILL command that was entered cannot be done because another category is already assigned to the device.

**System Action:** Processing of the ZTPLF command is ended and the device is left unchanged.

**User Response:** Do the following:

1. If the intention is to change the FILL category, enter **ZTPLF UNLOAD ALL**.
2. Enter **ZTPLF FILL** again with the desired category.

**CORE0212W TPLF *nnnn* FILL CAT–*catg* FOR DEV-*cuu* EMPTY**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*catg*
The FILL category that was associated with the device.

*cuu* The device address.

**Explanation:** The FILL category requested is empty.

**System Action:** The FILL category association with the device is removed.

**User Response:** Do the following:

1. Add more volumes to the FILL category.
2. Enter **ZTPLF FILL** to begin adding volumes automatically from that category again.

**CORE0217W TPLF *nnnn numvol* VOLUMES LEFT FOR FILL CAT–*catg***

**Where:**

*nnnn*
The subsystem user (SSU) name.

*numvol*
The number of volumes left in the category.

*catg*
The category.

**Explanation:** Less than a specified number of volumes are left in the FILL category.

**Note:** The number of volumes can be set up by each installation.

**System Action:** The warning message is sent to you. Automatic library loads are still attempted.

**User Response:** Add more volumes to the FILL category, if required.

**CORE0234I TPLF *nnnn* VSN *vvvvvv* AUTO-LOADED ON *cuu* - CAT :**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*vvvvvv*
The volume serial number (VSN). `*NONE*` is displayed if the volume was unloaded before the load completed.

*cuu* The device address.

*catg*
The category of the volume mounted.

**Explanation:** The next volume from the FILL category was loaded successfully onto the device.

**System Action:** The next volume from the FILL category is loaded automatically onto the device.

**User Response:** If you have a tape catalog that tracks this information, update it to indicate that the volume is now loaded on the specified device.

**CORE0262E TPLF *nnnn* ALL VOLUMES REMOVED FROM *cuu* FILL CATEGORY *catg* DELETED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*catg*
The library FILL category.

**Explanation:** An attempt was made to load a volume for a device that was assigned a FILL category but the load failed because:

- Of a library hardware failure
- There were no more volumes in the category specified.

**System Action:** The FILL category association with the device is removed.

**User Response:** Do the following:

1. Check the library error messages that were issued prior to this message to determine the cause of the failure.
2. Add more volumes to the FILL category, if necessary.
3. Enter **ZTPLF FILL** to begin adding volumes automatically from that category again.

---

**CORO0001I COMMIT SCOPE ACTIVITY**

**Explanation:** This is the normal response to the ZCORO command with the DISPLAY parameter specified. This message is followed by a display that shows the status of TPF transaction services processing.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCORO command and for an example of the informational display.

---

**CORO0002E SYSTEM MUST BE IN 1052 OR ABOVE FOR THIS ZCORO DISPLAY**

**Explanation:** The ZCORO command was entered with the DISPLAY parameter specified when the TPF system was below 1052 state. The TPF system must be at 1052 state or above before you can enter this command.

**System Action:** None.

**User Response:** Do the following:

1. Cycle the TPF system to 1052 state.
2. Enter the ZCORO command again with the DISPLAY parameter specified.

See *TPF Operations* for more information about the ZCORO command.

---

**CORO0003I VALID FUNCTIONS ARE: DISPLAY, (NO)APPLY**

**Explanation:** One of the following occurred:

- The ZCORO command was entered with an incorrect parameter specified.
- **ZCORO HELP** was entered to obtain online help information about the ZCORO command.
- **ZCORO ?** was entered to obtain online help information about the ZCORO command.

**System Action:** None.

**User Response:** Enter the ZCORO command again specifying the correct parameter.

See *TPF Operations* for more information about the ZCORO command.

---

**CORO0004E ZCORO (NO)APPLY MESSAGE IS NOT VALID AT THIS TIME**

**Explanation:** The ZCORO command was entered with the APPLY or NOAPPLY parameter specified before you were prompted to enter the command.

**System Action:** None.

**User Response:** Wait until you receive a prompt to enter the ZCORO command with the APPLY or NOAPPLY parameter specified.

See *TPF Operations* for more information about the ZCORO command.

---

**CORO0005I RECOVERY LOG WILL BE APPLIED**

**Explanation:** This is the normal response to the ZCORO command with the APPLY parameter specified.

**System Action:** The log manager attempts to apply the recovery during restart.

**User Response:** None.

See *TPF Operations* for more information about the ZCORO command.

---

**CORO0006I RECOVERY LOG WILL BE INITIALIZED**

**Explanation:** This is the normal response to the ZCORO command with the NOAPPLY parameter specified.

**System Action:** The log manager initializes the log again during restart instead of recovering it.

**User Response:** None.

See *TPF Operations* for more information about the ZCORO command.

---

**CORO0007E ZCORO APPLY IS NOT A VALID RESPONSE**

**Explanation:** The ZCORO command was entered with the APPLY parameter specified in response to receiving the CL210003E message.

**System Action:** The TPF system continues to wait in restart mode until the correct response is entered.

**User Response:** Do one of the following:

- Enter the ZCORO command with the NOAPPLY parameter specified.
- IPL the TPF system again with the correct configuration.

See *TPF Operations* for more information about the ZCORO command.

# COSA–COS3

---

**COSA0089W** *zzzz nnnn* **REMOVE** *status yyy* **VSN** *vvvvvv* **DEVICE** *cuu* **SUBSYSTEM INVALID**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*status*
ACTIVE or STANDBY

*yyy* The symbolic tape name.

*vvvvvv*
The volume serial number (VSN).

*cuu* The device address.

**Explanation:** The specified tape is dismounted because the subsystem is not in the configuration.

**System Action:** The TPF system unloads the specified tape. This message is followed by the COTB0137A message and possibly the COTB0138W message.

**User Response:** None.

---

**COSA0094E** *zzzz nnnn* **— SYSTEM ERROR READING LABEL INFORMATION**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** A disk read error occurred during an attempt to retrieve the tape label mask record (TLMR). This is likely a hardware error.

**System Action:** None.

**User Response:** See your IBM representative to determine the cause of the error and to correct the problem.

---

**COSA0140W** *zzzz nnnn* **REMOVE** *status yyy* **VSN** *vvvvvv* **DEVICE** *cuu* **IS FILE PROTECTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*status*
ACTIVE or STANDBY

*yyy* The symbolic tape name.

*vvvvvv*
The volume serial number (VSN).

*cuu* The device address.

**Explanation:** The specified tape is dismounted because the tape is mounted for output but is file protected.

**System Action:** The TPF system unloads the specified tape. This message is followed by the COTB0137A, COTB0138W, or COSA0146A messages.

**User Response:** None.

---

**COSA0141W** *zzzz nnnn* **REMOVE** *status yyy* **VSN** *vvvvvv* **DEVICE** *cuu* **AT LOAD POINT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*status*
ACTIVE or STANDBY

*yyy* The symbolic tape name.

*vvvvvv*
The volume serial number (VSN).

*cuu* The device address.

**Explanation:** The specified tape was dismounted because it was rewound — for example, it is positioned at load point.

**System Action:** The TPF system unloads the specified tape. This message is followed by the COTB0137A, COTB0138W, or COSA0146A messages.

**User Response:** None.

---

**COSA0142W** *zzzz nnnn* **REMOVE** *status yyy* **VSN** *vvvvvv* **DEVICE** *cuu* **NOT READY**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*status*
ACTIVE or STANDBY

*yyy* The symbolic tape name.

*vvvvvv*
The volume serial number (VSN).

*cuu* The device address.

**Explanation:** The specified tape was dismounted because the device is not ready.

**System Action:** This message is followed by the COTB0137A, COTB0138W, or COSA0146A messages.

**User Response:** Remove the tape from the drive.

---

**COSA0143W** *zzzz nnnn* **REMOVE** *status yyy* **VSN** *vvvvvv* **DEVICE** *cuu* **SENSE ERROR**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*status*
ACTIVE or STANDBY

*yyy* The symbolic tape name.

*vvvvvv*
The volume serial number (VSN).

*cuu* The device address.

**Explanation:** The specified tape was dismounted because an input/output (I/O) error occurred when the device was sensed. Any of the following errors may have occurred:

- The device is not physically attached to the TPF system or to the control unit interface
- The device is physically attached but the control unit is reserved by another operating system
- The control unit or channel is malfunctioning.

**System Action:** This message is followed by the COTB0137A, COTB0138W, or COSA0146A messages.

**User Response:** Delete the device from the TPF tape configuration by entering the ZTVAR command.

---

**COSA0144W** *zzzz nnnn* **REMOVE** *status yyy* **VSN** *vvvvvv* **DEVICE** *cuu* **STATUS UNSAFE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*status*
ACTIVE or STANDBY

*yyy* The symbolic tape name.

*vvvvvv*
The volume serial number (VSN).

*cuu* The device address.

**Explanation:** The specified tape is dismounted because the status of the tape cannot be determined.

**System Action:** The TPF system unloads the specified tape. This message is followed by the COTB0137A, COTB0138W, or COSA0146A messages.

**User Response:** None.

---

**COSA0146A** *zzzz nnnn* **MOUNT** *yyy* **TAPE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** This message follows a warning indicating the reason for the real-time tape specified being dismounted.

**System Action:** The TPF system waits for the tape to be remounted before proceeding with cycle up to 1052 state. The COSK0079A message was issued previously but the tape was not mounted.

**User Response:** Mount the specified tape by entering the ZTMNT command.

---

**COSA0164A** *zzzz nnnn* **REMOVE** *status yyy* **VSN** *vvvvvv* **FROM DEVICE** *cuu* **TAPE POSITION INVALID**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*status*
ACTIVE or STANDBY

*yyy* The symbolic tape name.

*vvvvvv*
The volume serial number (VSN).

*cuu* The device address.

**Explanation:** During tape restart, a standby or alternate (ALT) tape was located that is not positioned properly. Two tapemarks are written to mark the end of the data and the tape dismounted from the tape status table.

**System Action:** The specified tape is unloaded. This message is followed by the COTB0138W message.

**User Response:** Review the tape to determine which records are written that caused the tape to be positioned improperly. The tape may contain valid data.

---

**COSA0297W** *zzzz nnnn* **REMOVE** *status yyy* **VSN** *vvvvvv* **DEVICE** *cuu* **UNSUPPORTED FORMAT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*status*
ACTIVE or STANDBY

*yyy* The symbolic tape name.

*vvvvvv*
The volume serial number (VSN).

*cuu* The device address.

**Explanation:** The specified tape is dismounted because the device is operating at a format not supported by the TPF system.

**System Action:** The TPF system unloads the specified tape. This message is followed by the COTB0137A, COTB0138W, or COSA0146A messages.

**User Response:** None.

---

**COSB0039E** *zzzz nnnn* **UNAVAILABLE PATH DELETED FOR DEVICE** *cuu*

**Where:**

*zzzz*
The function code that the message originated from.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An attempt to access a device by using a defined channel path was unsuccessful.

**System Action:** The channel path on which the command was issued is deleted from the group of available channel paths for the device. If no valid channel paths remain, the device is deleted from the tape status table.

**User Response:** Do the following:

1. Ensure that the channel path ID is online.
2. Verify that the input/output configuration program (IOCP) path definitions are correct and that all defined paths are enabled.

---

**COSB0106A** *zzzz nnnn* **REMOVE STANDBY** *yyy* **FROM DEVICE** *cuu*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** One of the following occurred:

- A ZTOFF or ZTOCU command was entered to dismount the tape.
- The tape was dismounted during the backward switch of an input tape.
- The tape was not ready or at the correct load point during a forward switch operation.

**System Action:** The TPF system unloads the specified tape. If the error occurred during a forward switch operation, the TPF system switches to a suitable alternate (ALT) tape or requests for the standby tape to be remounted.

**User Response:** Do one of the following:

- If the tape was dismounted because of a ZTOFF or ZTOCU command request or during the backward switch of an input tape, remove the tape from the tape drive.
- If there was an error during a forward switch operation, remount the standby tape if requested to do so. Otherwise, there is no further action for you to take.

If the tape was an output standby tape, the TPF system will not use the tape and you do not need to keep the tape.

See *TPF Operations* for more information about the tape support commands.

---

**COSB0144W** *zzzz nnnn* **REMOVE** *status yyy* **VSN** *vvvvvv* **DEVICE** *cuu* **STATUS UNSAFE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*status*
ACTIVE or STANDBY

*yyy* The symbolic tape name.

*vvvvvv*
The volume serial number (VSN).

*cuu* The device address.

**Explanation:** See the explanation for the COSA0144W message.

**System Action:** See the system action for the COSA0144W message.

**User Response:** See the user response for the COSA0144W message.

---

**COSB0149W** *zzzz nnnn* **DEVICE** *cuu* **DELETED UNABLE TO SENSE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The specified device is deleted from the TPF tape configuration because an input/output (I/O) error occurred when the device was sensed. This indicates either a hardware or licensed internal code error.

**System Action:** None.

**User Response:** Enter the ZTVAR command after taking appropriate corrective action or this message is likely to occur again. The ZTVAR command is used to make alternative devices available.

See *TPF Operations* for more information about the tape support commands.

---

**COSB0152W** *zzzz nnnn* **TAPE** *yyy* **UNAVAILABLE DEVICE** *cuu* **DELETED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

**Explanation:** A device is deleted from the TPF tape configuration. The specified tape was previously mounted on the device.

**System Action:** This message is displayed following a warning message indicating the reason for deleting the device. It is also displayed if the device had a previously mounted

tape and one of the following occurred:

- The common I/O (CIO) is unable to mount the device
- The PAM returned from the mount request is zero indicating no logical paths to the device are available.

**Note:** If the device did not have a previously mounted tape, the COSB0149W message is displayed.

**User Response:** You may need to remount the specified tape, depending on the operational procedures at your location.

---

**COSB0153W** *zzzz nnnn* **DEVICE** *cuu* **DELETED CONTROL UNIT** *cu* **NOT DEFINED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*cu* The control unit address.

**Explanation:** The specified path is deleted from the TPF tape configuration because its control unit address was not defined as a tape control unit during TPF system generation.

**System Action:** If a tape was previously mounted on the device, this message is followed by the COSB0152W message.

**User Response:** Do one of the following:

- You may need to enter the ZTVAR command to make alternative drives available.
- If the specified address is a tape control unit, advise your ` system support personnel because the tape control unit cross-reference table may need to be regenerated.
- If the address is a valid tape control unit, then an IODEV macro in SIP STAGE1 must be added to define that control unit to the TPF tape configuration.

See *TPF Operations* for more information about the tape support commands.

---

**COSB0175E** *zzzz nnnn* **DEVICE** *cuu* **— DRIVE OFFLINE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A command is issued that requires the device to be online but one of the following errors occurred:

- The drive online/offline switch is set to the offline position
- The drive is powered down
- The drive is not installed.

**System Action:** None.

**User Response:** If the tape drive exists, then the drive should be switched online.

---

**COSB0184E** *zzzz nnnn* **DEVICE** *cuu* **DELETED UNABLE TO ASSIGN**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An attempt to assign a device to a defined channel path is unsuccessful.

**System Action:** The device is deleted from the tape status table.

**User Response:** Identify the controlling host to which this device is assigned. Unassign it if desired.

---

**COSB0185E** *zzzz nnnn* **DEVICE** *cuu* **DELETED UNABLE TO SET PASSWORD**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An attempt to retrieve CTKI to set the password failed or the password used is different from that already established.

**System Action:** The device is deleted from the tape status table.

**User Response:** If an error occurred while retrieving CTKI, then a CTL-00FB system error is reported and the address allocated for CTKI should be checked for a physical error.

If a CTL-00FB error is not reported, then a password different from the TPF password is established. An I/O system reset is required before the password can be set by the TPF system.

---

**COSB0186W** *zzzz nnnn* **DEVICE** *cuu* **DELETED INVALID DEVICE TYPE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An attempt was made to add an unsupported device type to the TPF configuration.

**System Action:** The device is deleted from the tape status table.

**User Response:** Check whether the device address is for a tape device that is supported by the TPF system.

See the *TPF Migration Guide: Program Update Tapes* for more information about the supported tape devices.

---

**COSB0187E** *zzzz nnnn* **DEVICE** *cuu* **DELETED CONFIGURATION ERROR**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** One of the following errors occurred:

- Path verification processing detected that one or more paths failed to lead to the same device as defined in the IOCP generation.
- An attempt was made to add a device to the tape status table and the device address was defined to the TPF system in the system initialization program (SIP) as both a tape device and another device type.

**System Action:** The device is deleted from the tape status table.

**User Response:** Do one of the following:

- Verify that IOCP path definitions are correct and that the device is installed correctly.
- Ensure that devices defined by IODEV in SIP are defined as one device type only.

---

**COSB0198E** *zzzz nnnn* **— DEVICE** *cuu* **DELETED. UNABLE TO RETRIEVE DEVICE ASSIGNMENTS.**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An error occurred while retrieving the DTDAT data record.

**System Action:** The TPF system issues a system error and the device is removed from the configuration.

**User Response:** Do the following:

1. Examine the system error dump to determine the cause of the DTDAT data record retrieval error.
2. Correct the problem.

---

**COSB0296E** *zzzz nnnn* **DEVICE** *cuu* **REQUIRED SUBSYSTEM FUNCTION HAS FAILED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An inhibit extended recovery function or enable extended recovery function, which is required by the TPF system, has failed on the device.

**System Action:** The device is removed from the configuration.

**User Response:** Verify that the devices are at the correct licensed internal code (LIC) levels.

See the *TPF Migration Guide: Program Update Tapes* for more information about which levels of code and software programs should be installed on your devices.

---

**COSB0298W** *zzzz nnnn* **DEVICE** *cuu* **DELETED NO SUPPORTED FORMAT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The specified device is deleted from the TPF tape configuration because it cannot operate at any of the formats supported by the TPF system.

**System Action:** If a tape was previously mounted on the device, this message is followed by the COSB0152W message.

**User Response:** You may need to enter the ZTVAR command to make alternative devices available.

See *TPF Operations* for more information about the tape support commands.

---

**COSD0094E** *zzzz nnnn* **SYSTEM ERROR READING LABEL INFORMATION**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSA0094E message.

**System Action:** See the explanation for the COSA0094E message.

**User Response:** See the explanation for the COSA0094E message.

---

**COSD0096E** *zzzz nnnn* **SYSTEM ERROR WRITING LABEL INFORMATION**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** During an attempt to update the tape label directory (TPLD), a disk write error occurred. This is probably a hardware error.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COSE0296E** *zzzz nnnn* **— DEVICE** *cuu* **REQUIRED SUBSYSTEM FUNCTION HAS FAILED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COSB0296E message.

**System Action:** See the system action for the COSB0296E message.

**User Response:** See the user response for the COSB0296E message.

---

**COSE0299I** *zzzz nnnn* **ERROR WRITING TRAILER LABELS VSN** *vvvvvv* **G***gggg* **S***ssss* **F***ffffff ll bbbbb ccccc*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*vvvvvv*
The volume serial number (VSN).

*gggg*
The generation number.

*ssss* The sequence number.

*ffffff*
The format specification.

*ll* The label specification (SL, SU, or NL).

*bbbbb*
The blocking specification (BLK or NOBLK).

*ccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** The tape labeling program detected I/O errors while trying to write trailer labels. This message is followed by the COTC0031A, COTG0031A, or COTS0031A message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COSE0312E** *zzzz nnnn* **DEVICE** *cuu* **REQUIRED SUBSYSTEM FUNCTION HAS FAILED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An inhibit extended recovery function or enable extended recovery function that is required by the TPF system has failed on the device.

**System Action:** The device is removed from the configuration.

**User Response:** Verify that the devices are at the correct licensed internal code (LIC) levels.

See the *TPF Migration Guide: Program Update Tapes* for more information about which levels of code and software programs to install on your devices.

---

**COSI0000E** *zzzz nnnn* **DEVICE** *cuu* **IN USE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The requested function cannot be performed on the specified device because one of the following errors occurred:

- A tape is already mounted on the device.
- The tape routines are already using the device.

**System Action:** None.

**User Response:** Enter the ZDTAP command to determine whether the command should be entered again following completion of processing by the routines currently using the device or specifying a different device.

---

**COSI0002E** *zzzz nnnn* **DEVICE** *cuu* **NOT CONFIGURED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The requested function cannot be performed on the specified device because the device is not configured for the TPF system.

**System Action:** None.

**User Response:** Do one of the following:

- Enter the command again and specify a different device
- Add the device to the TPF tape configuration by entering the ZTVAR command and then entering the command again.

**COSI0012E** *zzzz nnnn* **INVALID FORMAT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The format of the command is not valid.

**System Action:** None.

**User Response:** Do the following:

1. Refer to the appropriate tape commands to determine the correct format of the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the tape support commands.

**COSI0045E** *zzzz nnnn* **INVALID DEVICE ADDRESS SPECIFIED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** A tape support command was entered, but the requested function cannot be performed on the specified device because the device specified is not a valid tape address.

**System Action:** None.

**User Response:** Enter the command again and specify a valid tape address for the device.

See *TPF Operations* for more information about the tape support commands.

**COSI0068E** *zzzz nnnn* **TAPE NAME** *yyy* **INVALID**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** One of the special tape names (XXX, YYY, ALT, or ALL) was specified in a command for which that name is not a valid parameter.

**System Action:** None.

**User Response:** Do the following:

1. Refer to the appropriate tape commands to determine the correct format of the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the tape support commands.

**COSI0097E** *zzzz nnnn* **ENTRY RESTRICTED TO BASIC SUBSYSTEM**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The command that caused this message is restricted to the basic subsystem (BSS) and must be entered again for that subsystem.

**System Action:** None.

**User Response:** Enter the command again.

See *TPF Operations* for more information about the tape support commands.

**COSI0303E** *zzzz nnnn* **— DEVICE** *cuu* **INCAPABLE OF REQUESTED OR DEFAULTED FORMAT** *ffffff*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*ffffff*
The format specification.

**Explanation:** A tape support command was entered (directly or indirectly) that requires the device to operate in a format that the device cannot operate.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the command again and specify a different format.
- If the specified or implied format is required, enter the command again for a more suitable tape device.

See *TPF Operations* for more information about the tape support commands.

---

**COSI0305E** *zzzz nnnn* **TAPE** *yyy* **INVALID PARAMETER FORMAT –** *xxxxxxxx*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*xxxxxxxx*
The user parameter that was not valid.

**Explanation:** When creating or changing tape label information (by entering the ZTLBL command), the format was not valid or a format was specified that is not supported by the TPF system.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the tape support commands.

---

**COSK0001I** ***CP*** *nnnn* **DEVICE** *cuu* **NOT READY**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** Following an attention interrupt indicating that the device had changed status from not ready to ready, it was discovered that the tape was not ready.

**System Action:** The volume remains loaded in the device.

**User Response:** This is an informational message to notify you that the tape is currently not ready.

---

**COSK0003E** ***CP*** *nnnn* **OUTPUT DEVICE** *cuu* **IS WRITE PROTECTED**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A write-protected volume was loaded onto a device that is enabled for automatic tape mounting. This error message notifies you that a write-protected volume was loaded on a device enabled for automatic tape mounting. The device cannot be used for automatic tape mounting while the write-protected volume remains loaded.

**System Action:** The volume remains loaded in the device. The device is not available for automatic tape mounting while this volume is loaded.

**User Response:** Enter the ZTOFF command to remove the volume from the device.

See *TPF Operations* for more information about the ZTOFF command.

---

**COSK0005I** ***CP*** *nnnn* **DEVICE** *cuu* **HAS NO VOL1 LABEL - INITIALIZE TAPE**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A write-enabled volume was loaded on the indicated device but the volume does not have a VOL1 record.

**System Action:** The volume remains loaded in the device.

**User Response:** This is an informational message to notify you that an uninitialized volume was loaded on a device. To remove that volume from the device, enter the ZTOFF command.

---

**COSK0016E** ***CP*** *nnnn* **DEVICE** *cuu* **TAPE UNREADABLE**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** Attempts to read or reposition the volume on the indicated device failed.

**System Action:** The volume remains loaded in the device.

**User Response:** This is an informational message to notify you that a volume was loaded on a device that cannot be read or repositioned properly to validate the expiration date or to complete automatic tape mounting. To remove that volume from the device, enter ZTOFF command.

---

**COSK0039E** *zzzz nnnn* **UNAVAILABLE PATH DELETED FOR DEVICE** *cuu*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COSB0039E message.

**System Action:** See the system action for the COSB0039E message.

**User Response:** See the user response for the COSB0039E message.

---

**COSK0042E** *zzzz nnnn* **REMOVE** *yyy* **FROM DEVICE** *cuu* **VSN** *vvvvvv* **ERROR ATTEMPTING TAPE SWITCH**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** During a tape switch, an error occurred when an attempt was made to write to the tape being switched to. The tape specified in the message does not contain any data and should not be considered part of the data set.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COSK0079A** *zzzz nnnn* **MOUNT** *yyy* **TAPE FOR** *status*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*status*
INPUT or OUTPUT, as determined by the operating system.

**Explanation:** The TPF system requires the specified tape to be mounted in the specified status.

**System Action:** None.

**User Response:** Mount the tape by entering the ZTMNT command.

See *TPF Operations* for more information about the ZTMNT command.

---

**COSK0154E** ***CP*** *nnnn* **DEVICE** *cuu* **ASSIGNED ELSEWHERE**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the CEFR0154E message.

**System Action:** See the system action for the CEFR0154E message.

**User Response:** See the user response for the CEFR0154E message.

---

**COSK0156E** *zzzz nnnn* **TAPE** *yyy* **ON DEVICE** *cuu* **- VOLUME FENCED CARTRIDGE UNLOADED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

**Explanation:** A unit check is received with associated sense data indicating that the volume is fenced.

**System Action:** The control program performs all necessary error recovery, which includes unloading the tape from the drive where the error occurred.

**User Response:** None.

---

**COSK0157E** *zzzz nnnn* **DEVICE** *cuu* **– DATA CHECK**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* Device address

**Explanation:** A unit check is received with associated sense data indicating a data check. This is received for ERA 26 on a blocked tape.

**System Action:** The control program performs all necessary recovery operations.

**User Response:** None.

---

**COSK0159E** *zzzz nnnn* **DEVICE** *cuu* **– DATA STREAMING ERROR**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A unit check is received with associated sense data indicating a data streaming error.

**System Action:** The control program performs all necessary recovery operations.

**User Response:** None.

---

**COSK0163E** *zzzz nnnn* **DEVICE** *cuu* **— ALL PATHS RESET**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** All paths to the specified device are reset.

**System Action:** None.

**User Response:** To regain access to the device you must delete it by entering the ZTVAR command. Then, you can add the device again.

See *TPF Operations* for more information about the ZTVAR command.

---

**COSK0166A** *zzzz nnnn* **READY TAPE ON DEVICE** *cuu*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The specified device requires user intervention.

**System Action:** When the device is made ready, processing of the tape queue continues.

**User Response:** None.

---

**COSK0167E** *zzzz nnnn* **DEVICE** *cuu* **— FUNCTION INCOMPATIBLE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A unit check is received with the associated sense data indicating an incompatible function.

**System Action:** The control program performs all necessary recovery operations.

**User Response:** None.

---

**COSK0168W** *zzzz nnnn* **TAPE** *yyy* **ON DEVICE** *cuu* **IS RUNNING IN DEGRADED MODE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** The control unit detected a condition that indicates that certain subsystem resources are unavailable or are performing in degraded mode.

**System Action:** The subsystem remains operational but degraded performance may be observed.

**User Response:** None.

---

**COSK0169W** *zzzz nnnn* **DEVICE** *cuu* **DDR ABORTED — ERROR READING CONTROL UNIT BUFFER**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An error occurred during dynamic device reconfiguration (DDR).

**System Action:** Recovery is aborted and normal processing is resumed. Some data in the control unit buffer may not have been recovered.

**User Response:** None.

---

**COSK0170I** *zzzz nnnn* **DEVICE** *cuu* **— AUTOMATIC CARTRIDGE LOADER INTERVENTION REQUIRED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A tape is unloaded from a device that has the automatic cartridge loader feature but no more cartridges are available in the input stack or there is no more room in the output stack.

**System Action:** None.

**User Response:** Do one of the following:

- Place more tapes in the input stack of the loader
- Remove tapes from the output stack as required.

**COSK0171E** *zzzz nnnn* **DEVICE** *cuu* **— TAPE LENGTH INCOMPATIBLE CARTRIDGE UNLOADED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An Enhanced Capacity Cartridge System Tape cartridge (ECCST) was loaded into a device incapable of reading from or writing to it.

**System Action:** The control program performed all necessary recovery including unloading the cartridge from the drive reporting the error.

**User Response:** Do the following:

1. Remove the ECCST cartridge from the drive reporting the error.
2. Replace the cartridge with one that the drive can use or move the cartridge to a drive that can use the ECCST tape.

See *TPF System Generation* for more information.

**COSK0175E** *zzzz nnnn* **DEVICE** *cuu* **— DRIVE OFFLINE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A command is issued that requires the device to be online but one of the following errors occurred:

- The drive online/offline switch is set to the offline position
- The drive is powered down
- The drive is not installed.

**System Action:** None.

**User Response:** None.

**COSK0178E** *zzzz nnnn* **DEVICE** *cuu* **CHANNEL INTERFACE ERROR**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A channel interface error is reported for the device.

**System Action:** The input/output (I/O) operation is ended with a permanent error.

**User Response:** None.

**COSK0179E** *zzzz nnnn* **DEVICE** *cuu* **CHANNEL PROTOCOL ERROR**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A channel protocol error is reported for the device.

**System Action:** The input/output (I/O) is ended with a permanent error.

**User Response:** None.

**COSK0180E** *zzzz nnnn* **TAPE** *yyy* **ON DEVICE** *cuu* **END OF DATA DETECTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

**Explanation:** An attempt is made to read beyond valid data or backward through data that is not valid. Normally, this indicates that the volume was not closed properly when it was written.

**System Action:** The subsystem accepts further attempts to recover any valid data beyond the end-of-data marker. The subsystem returns the proper error codes for any further errors found.

**User Response:** None.

**COSK0181E** *zzzz nnnn* **TAPE** *yyy* **ON DEVICE** *cuu* **MAXIMUM BLOCK SIZE EXCEEDED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

**Explanation:** A write command was issued that would write a block larger than the maximum size that the control unit can write.

**System Action:** The data block is not written to tape.

**User Response:** None.

---

**COSK0182E** *zzzz nnnn* **DEVICE** *cuu* **FORMAT INCOMPATIBLE, 3480 XF**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A cartridge with a 3840 format identification mark was loaded into a device that writes 3480-2 XF format and a write command was issued to the control program.

**System Action:** None.

**User Response:** Mount the tape on a device capable of writing 3480 format or reinitialize the tape in 3480-2 XF format.

**Note:** Reinitializing the tape destroys any data that is currently on the tape.

---

**COSK0183E** *zzzz nnnn* **DEVICE** *cuu* **FORMAT INCOMPATIBLE, 3480-2 XF**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An attempt was made to read a cartridge recorded in 3480-2 format by a device incapable of reading 3480-2 XF format.

**System Action:** None.

**User Response:** Mount the tape on a device capable of reading 3480-2 XF format or reinitialize the tape in a format that the device can read.

**Note:** Reinitializing the tape destroys any data that is currently on the tape.

---

**COSK0190E** *zzzz nnnn* **DEVICE** *cuu* **— LENGTH VIOLATION: TAPE TOO LONG CARTRIDGE UNLOADED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The cartridge loaded into the drive specified contains tape that is too long for a 3480/3490 device.

**System Action:** The control program performed all necessary recovery including unloading the cartridge from the drive reporting the error.

**User Response:** Remove the cartridge and replace it with another that contains the proper length of tape. The cartridge containing the incorrect length of tape should be removed from the tape library since it is defective.

See *TPF System Generation* for more information.

---

**COSK0191E** *zzzz nnnn* **DEVICE** *cuu* **—LENGTH VIOLATION: TAPE TOO SHORT CARTRIDGE UNLOADED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The cartridge loaded into the drive specified contains tape that is too short for a 3480/3490 device.

**System Action:** The control program performed all necessary recovery including unloading the cartridge from the drive reporting the error.

**User Response:** Remove the cartridge and replace it with another that contains the proper length of tape. The cartridge containing the incorrect length of tape should be removed from the tape library since it is defective.

See *TPF System Generation* for more information.

---

**COSK0195I** ***CP*** *nnnn* **DEVICE** *cuu* **UNSUPPORTED MESSAGE FORMAT** *xxxxxxxx*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*xxxxxxxx*
The first four bytes of data that the control unit sent to the TPF system, including an indicator of the message format.

**Explanation:** The status returned in response to a Read Subsystem Data command indicated a format that the TPF system does not currently support.

**System Action:** The volume remains loaded in the device. The TPF system signals the device that the message format is not supported.

**User Response:** This is an informational message to notify you that the tape subsystem requested a function that is not currently supported by the TPF system.

---

**COSK0196E** ***CP*** *nnnn* **DEVICE** *cuu* **ATTENTION PROCESSING FAILED**

**Where:**

*nnnn*
The basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An input/output (I/O) operation that was part of attention interrupt processing was not successful. The I/O operation was one of the following:

- Read subsystem data
- Sense
- Logical write protect
- Extended recovery
- Rewind
- Perform subsystem function
- Locate block.

This error message notifies you that an attention interrupt was received from the device referenced in the message and an attempt to process that interruption was not successful.

**System Action:** None.

**User Response:** If the device is attached to a 3494/3495 tape library, the library may have been presenting status information to the TPF system so you need to examine the library manager console for any messages or status.

**COSK0199E** ***CP*** *nnn* **DEVICE** *cuu* **ATTENTION PROCESSING FAILED**

**Where:**

*nnn*
The basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An input/output (I/O) operation that was part of attention interrupt processing was not successful. The I/O operation was either a Sense command or a Perform Subsystem Function command.

This error message notifies you that an attention interrupt was received from the device referenced in the message and an attempt to process that interruption was not successful.

**System Action:** None.

**User Response:** If the device is attaced to an IBM 3494 or IBM 3495 tape library, the library may have been presenting status information to the TPF system so you need to examine the library manager console for any messages or status.

**COSK0202I** ***CP*** *nnnn* **TAPE** *yyy* **ON DEVICE** *cuu* **DDR INITIATED**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

**Explanation:** An error has occurred on the tape device requiring recovery of the CU buffer for that device.

**System Action:** Following a tape switch, the data in the CU buffer for the device indicated will be retrieved and written to the standby tape.

**User Response:** None. This message may be followed by the COSL0081A message, requesting a standby tape be mounted. This message should be followed by the COSK0203I message, which indicates that DDR recovery is complete.

**COSK0203I** ***CP*** *nnnn* **TAPE** *yyy* **ON DEVICE** *cuu* **DDR COMPLETED**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

**Explanation:** CU buffer recovery has successfully completed for that device.

**System Action:** Normal operations to the device are resumed.

**User Response:** None. This message should have been preceded by the COSK0202I message, which indicates that DDR had started for that device.

**COSK0206E** ***CP*** *nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **IN USE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The volume cannot be used because it is already in use.

**System Action:** The volume specified cannot be loaded. The device status remains unchanged.

**User Response:** This entry cannot be done until the volume is unloaded from the device it is currently loaded on. You can query each device attached to the TPF system to see whether the volume in question is loaded to the device. Otherwise, you need to do a similar query from the other operating systems attached to the library.

**COSK0207E** ***CP*** *nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **SOURCE CATEGORY MISMATCH**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The ZTPLF LOAD or MOVE command that was entered was rejected because the category specified is not the same as the category of the volume.

**System Action:** The volume specified cannot be used. The device status remains unchanged. No action is taken.

**User Response:** Enter the command again and specify the correct category and volume serial number (VSN).

---

**COSK0208E** ***CP*** *nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **NOT IN LIBRARY**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The volume serial number (VSN) referenced in the message is not in the library.

**System Action:** The TPF system ends the library function that requested the volume.

**User Response:** Do the following:

1. Add the volume to the library.
2. Enter the command again.

---

**COSK0211E** ***CP*** *nnnn* **DEVICE** *cuu* **CATEGORY RESTRICTED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The category is reserved and cannot be used for this function. This occurs when the volume serial number (VSN) specified is assigned to the Cleaner-Volume category.

**System Action:** Processing is ended.

**User Response:** Select a volume that is not in the cleaner category.

---

**COSK0213I** ***CP*** *nnnn* **DEVICE** *cuu* **LOADING NEXT VOLUME FROM ACL**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** This message is issued when a cartridge is loaded in a tape device that has the Automatic Cartridge Loader (ACL) feature installed.

**System Action:** None.

**User Response:** Monitor ACL usage to ensure the tape supply is not used up.

---

**COSK0219E** ***CP*** *nnnn* **DEVICE** *cuu* **NO CATEGORIES AVAILABLE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** All categories are already reserved.

**System Action:** A new category was not reserved for this TPF system.

**User Response:** The entry cannot be done until a category is released.

---

**COSK0224I** ***CP*** *nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **INACCESSIBLE VOLUME FOUND**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** A volume that was reported previously as inaccessible was made accessible. The inventory was updated to reflect that the volume is no longer inaccessible.

**System Action:** None.

**User Response:** This volume can now be used.

---

**COSK0231E** ***CP*** *nnnn* **DEVICE** *cuu* **CATEGORY EMPTY**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library function that was requested was rejected because there are no volumes associated with the category.

**System Action:** A library function was started and the status returned was that no volumes were associated with the category.

**User Response:** Do one of the following:

- If the correct category was specified, no further action is required
- Enter the command again and specify the correct category.

---

**COSK0232E** ***CP*** *nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **UNEXPECTED VOLUME EJECTED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The library found a volume in the library that was not in the inventory. The volume is ejected from the library.

**System Action:** None.

**User Response:** Do the following again:

1. Retrieve the volume from the output station.
2. Determine where the volume belongs.

---

**COSK0233E** ***CP*** *nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **MISPLACED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The TPF system detected a misplaced volume.

**System Action:** None.

**User Response:** Determine why the volume became misplaced.

---

**COSK0235E** ***CP*** *nnnn* **DEVICE** *cuu* **INVALID EXTERNAL VOLSER DETECTED VOLUME LEFT IN INPUT STATION**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library detected that a cartridge in the input station:

- Had an unreadable external volume serial number (VSN)
- Did not have an external label
- Had characters in the external label that are not valid.

**System Action:** None.

**User Response:** Do the following again:

1. Retrieve the volume from the input station.
2. Determine why the external VSN was unreadable, missing, or contained characters that are not valid.

---

**COSK0236E** ***CP*** *nnnn* **DEVICE** *cuu* **NO RESERVED CATEGORIES –** *hostname*

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*hostname*
The token host name for this host system.

**Explanation:** There were no categories reserved for the specified host system.

**System Action:** A message is sent indicating that there are no categories reserved for the host system specified.

**User Response:** None.

---

**COSK0238E** ***CP*** *nnnn* **DEVICE** *cuu* **CATEGORY CANNOT BE RELEASED NOT RESERVED FOR THIS HOST**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The category cannot be released because it was not previously reserved for this host system.

**System Action:** End the library function trying to release the category specified.

**User Response:** Do the following again:

1. Specify a category that was reserved for this host system.
2. Enter the command again.

---

**COSK0239E** ***CP*** *nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **INACCESSIBLE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The TPF system detected an inaccessible volume.

**System Action:** None.

**User Response:** Determine why the volume become inaccessible.

---

**COSK0240E** ***CP*** *nnnn* **DEVICE** *cuu* **CATEGORY ALREADY IN USE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The FILL category requested with a sequence option is already associated with another device.

**System Action:** The FILL category was not associated with the specified device.

**User Response:** Do one of the following:

- Disassociate the category from the other device
- Choose another category and enter the command again.

---

**COSK0242E** ***CP* *nnnn* DEVICE *cuu* ORDER SEQUENCE CHECK**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** A library request to unload a volume was rejected because the device specified:

- Already has another unload queued
- Does not have a volume loaded
- Already has a volume loaded.

**System Action:** The TPF system ends the library function.

**User Response:** Determine why an attempt was made to unload the volume when the status of the device prevented it.

---

**COSK0243E** ***CP* *nnnn* DEVICE *cuu* VSN *vvvvvv* DUPLICATE VOLSER LEFT IN INPUT STATION**

**Where:**

*nnnn*
The subsystem user (SSU).

*vvvvvv*
The volume serial number (VSN).

*cuu* The device address.

**Explanation:** There is already a volume in the library with the same volume serial number (VSN) as the volume in the input station. The duplicate volume remains in the input station.

**System Action:** None.

**User Response:** Do the following:

1. Retrieve the volume from the input station.
2. Determine why it is a duplicate.

---

**COSK0244I** ***CP* *nnnn* DEVICE *cuu* MISPLACED VSN *vvvvvv* FOUND**

**Where:**

*nnnn*
The subsystem user (SSU).

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** A misplaced volume was found.

**System Action:** None.

**User Response:** Library functions that require the volume indicated can now be done with that volume.

---

**COSK0245E** ***CP* *nnnn* DEVICE *cuu* VISION SYSTEM NOT OPERATIONAL**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The TPF system detected that the library vision system is not operational.

**System Action:** None. This is an informational message. The TPF system resumes normal operation.

**User Response:** Determine why the vision system is not operational.

---

**COSK0246E** ***CP* *nnnn* DEVICE *cuu* VSN *vvvvvv* DUPLICATE VOLSER EJECTED**

**Where:**

*nnnn*
The subsystem user (SSU).

*vvvvvv*
The volume serial number (VSN).

**Explanation:** A volume with a readable VSN was found in an unexpected location. The VSN was in the library manager inventory and an audit of the storage cell specified by the inventory found the expected volume present. The duplicate volume is placed in a convenient output station.

**System Action:** None.

**User Response:** Do the following:

1. Retrieve the volume from the output station.
2. Determine why the volume is a duplicate.

---

**COSK0252E** ***CP* *nnnn* DEVICE *cuu* LIBRARY MANAGER OFFLINE**

**Where:**

*nnnn*
The subsystem user (SSU).

*cuu* The device address.

**Explanation:** The library function was rejected because the control unit detected an unrecoverable error on the library attachment facility during initialization or during subsequent command processing. There are no other operational paths between the control unit and the library manager.

This message may also be received when the library manager is offline to the subsystem.

**System Action:** The library function is ended.

**User Response:** Repair actions may be required.

---

**COSK0253E** ***CP* *nnnn* DEVICE *cuu* LIBRARY MANAGER INCOMPATIBLE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library function was rejected because the control unit and library manager are incompatible.

**System Action:** The library function is ended.

**User Response:** Repair actions may be required.

---

**COSK0255E** ***CP* *nnnn* DEVICE *cuu* CATEGORY NOT RELEASED – NOT EMPTY**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The specified category cannot be released because it is not empty.

**System Action:** The category was not released and is still reserved for this TPF system.

**User Response:** Do the following:

1. Move all the volumes to another category.
2. Release the category.

---

**COSK0256E** ***CP* *nnnn* DEVICE *cuu* INVALID SOURCE CATEGORY**

**Where:**

*nnnn*
The subsystem user (SSU).

*cuu* The device address.

**Explanation:** The source category specified by a library command is not valid.

**System Action:** The requested library command is not performed.

**User Response:** Do the following:

1. Select a different category.
2. Try the operation again.

See *TPF Operations* for a list of reserved categories.

---

**COSK0257E** ***CP* *nnnn* DEVICE *cuu* INVALID TARGET CATEGORY**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The target category specified in a library command is not valid.

**System Action:** The requested library command is not performed.

**User Response:** Do the following:

1. Select a different category.
2. Try the operation again.

See *TPF Operations* for a list of reserved categories.

---

**COSK0258E** ***CP* *nnnn* DEVICE *cuu* VSN *vvvvvv* MOVED FROM MANUALLY EJECT TO PURGE CATEGORY**

**Where:**

*nnnn*
The subsystem user (SSU).

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The library detected a volume in the manually ejected category and moved it to the purge category.

**System Action:** The volume is moved to the purge-volume category and the function requesting the volume is ended.

**User Response:** Determine why the volume was left in the manually ejected category.

---

**COSK0260E** ***CP* *nnnn* DEVICE *cuu* VSN *vvvvvv* DAMAGED CARTRIDGE EJECTED FROM LIBRARY**

**Where:**

*nnnn*
The subsystem user (SSU).

*vvvvvv*
The volume serial number (VSN).

*cuu* The device address.

**Explanation:** The library determined that the cartridge was damaged in such a way that it could not be loaded on a device. The cartridge was ejected from the library.

**System Action:** None.

**User Response:** Do the following:

1. Remove the cartridge from the output station.
2. Inspect the cartridge.
3. Replace or repair the cartridge.
4. Enter the cartridge again into the library.

---

**COSK0263E** ***CP* *nnnn* DEVICE *cuu* PURGE CATEGORY INVALID FOR VSN *vvvvvv***

**Where:**

*nnnn*
The subsystem user (SSU) name.

*vvvvvv*
The volume serial number (VSN).

*cuu* The device address.

**Explanation:** The *to* category specified in a library function is for purge-volume and the volume serial number (VSN) specified is not misplaced or not assigned to the manually ejected category.

**System Action:** The TPF system ends the library function that requested the volume.

**User Response:** Determine why the volume in question is being purged although it is not in the manually ejected or misplaced category.

---

**COSK0264W** ***CP* *nnnn* DEVICE *cuu* INPUT STATION DOOR OPEN**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The input station door is open.

**System Action:** None.

**User Response:** Close the door.

---

**COSK0266W** ***CP* *nnnn* DEVICE *cuu* OUTPUT STATIONS FULL**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** All convenience or bulk output stations are full.

**System Action:** None.

**User Response:** Empty one or more output stations.

---

**COSK0268W** ***CP* *nnnn* DEVICE *cuu* LIBRARY COMPONENT UNAVAILABLE**

**Where:**

*nnnn*
The subsystem user (SSU).

*cuu* The device address.

**Explanation:** A library component has become unavailable.

**System Action:** None.

**User Response:** Check the library manager to determine which library component became unavailable.

---

**COSK0269W** ***CP* *nnnn* DEVICE *cuu* OUTPUT STATION DOOR OPEN**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The output station door is open.

**System Action:** None.

**User Response:** Close the door.

---

**COSK0271W** ***CP* *nnnn* DEVICE *cuu* LIBRARY PAUSED STATE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library is in paused operational state.

**System Action:** None.

**User Response:** Manual operation of the library may be required.

---

**COSK0276E** ***CP* *nnnn* DEVICE *cuu* LIBRARY INTERVENTION REQUIRED**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** A condition occurred in the library that requires you assist in the resolution of the condition.

**System Action:** None.

**User Response:** Do the following:

1. Pause the library.
2. Perform the intervention indicated on the library manager console.

---

**COSK0277E** ***CP* *nnnn* DEVICE *cuu* LIBRARY UNRECOVERABLE ERROR**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library manager found an unrecoverable error condition. All previously accepted library operations and pending responses are lost. The library manager is offline.

**System Action:** None.

**User Response:** Repair actions may be required.

---

**COSK0278E** ***CP* *nnnn* DEVICE *cuu* LIBRARY STORAGE CELLS FULL**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** All available storage cells in the library are full.

**System Action:** None.

**User Response:** Volumes must be ejected from the library to make cells available.

---

**COSK0279E** ***CP* *nnnn* DEVICE *cuu* LIBRARY OUT OF CLEANER VOLUMES**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** There are no cleaner volumes in the library and a clean operation is required.

**System Action:** None.

**User Response:** Add cleaner volumes to the library.

**COSK0280E** ***CP* *nnnn* DEVICE *cuu* FUNCTION NOT CAPABLE BY LIBRARY LIBRARY IN MANUAL MODE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The library function was not performed because the library is in manual mode and cannot perform the function.

**System Action:** Processing of the library function is ended.

**User Response:** Try the operation again when the library returns to automated mode.

**COSK0281E** ***CP* *nnnn* DEVICE *cuu* LIBRARY ENVIRONMENTAL ALERT**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** Smoke was detected in the library enclosure.

**System Action:** None.

**User Response:** Alert your operations center to possible smoke or fire in the library. Intervention will be required to reset the library from the Environmental Alert state before automated operations can resume.

**COSK0283E** ***CP* *nnnn* DEVICE *cuu* LIBRARY DEVICE FAILURE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The device had an error and the enhanced device error recovery was not successful.

**System Action:** None.

**User Response:** The device needs to be serviced. If desired, the operation using the device needs to be restarted by using another device.

**COSK0284I** ***CP* *nnnn* DEVICE *cuu* AVAILABLE TO LIBRARY**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The previously unavailable device is now available for all host system and library functions.

**System Action:** None.

**User Response:** Library functions can now be performed for the specified device.

**COSK0285W** ***CP* *nnnn* DEVICE *cuu* UNAVAILABLE TO LIBRARY**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** The previously available device is not unavailable for all host systems and library functions.

**System Action:** None.

**User Response:** The library functions cannot be performed for the specified device.

**COSK0286E** ***CP* *nnnn* DEVICE *cuu* LIBRARY MANAGER PROGRAM EXCEPTION**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** A program exception was detected by the library manager.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the program exception.
2. Repair actions may be required.

**COSK0288E** ***CP* *nnnn* VSN *vvvvvv* IS NOT VALID FOR OUTPUT**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The volume serial number (VSN) referenced in the message was loaded onto a tape device that had automount enabled, but the VTO CP user exit indicated that the tape was not valid for output.

**System Action:** The tape remains in the tape drive and is not mounted as an ALT tape.

**User Response:** Choose a volume that is authorized for output usage.

---

**COSK0291I** ***CP* *nnnn* DEVICE *cuu* LIBRARY COMPONENT AVAILABLE**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** A library component that was unavailable previously is now available.

**System Action:** None.

**User Response:** Check the library manager to determine which library component became available.

---

**COSK0310I** ***zzzz nnnn* — TAPE *yyy* MOUNTED ON DEVICE *cuu* VSN *vvvvvv* G*gggg* S*ssss* F*ffffff* *ll bbbbb ccccc***

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

*gggg*
The generation number.

*ssss* The sequence number.

*ffffff*
The format specification.

*ll* The label specification (SL, SU, or NL).

*bbbbb*
The blocking specification (BLK or NOBLK).

*ccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** The specified tape was mounted successfully on the requested device.

**System Action:** None.

**User Response:** None.

---

**COSK0369A** ***CP* *nnnn* DEVICE *cuu* — TAPE NOT AT LOAD POINT**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** After an attention interrupt indicating that the device changed status from not ready to ready, or after a TPINC MOUNT request was issued to the device, the TPF system found that the volume was not at load point.

**System Action:** The volume remains loaded in the device. Its position is unchanged.

**User Response:** Do the following:

1. Enter the ZDEBE command with the TL parameter specified to determine whether the volume should be mounted for output.
2. Do one of the following:
   - If the volume needs to be mounted, enter the ZTMNT command to mount the tape as an alternate (ALT) tape on that drive.
   - If the volume does not need to be mounted, unload the volume from the drive.

See *TPF Operations* for more information about the ZDEBE and ZTMNT commands.

---

**COSK0372E** ***CP* CHANNEL ERROR DETECTED ON DEVICE *cuu***

**Where:**

*cuu* The device address.

**Explanation:** This message occurs because a channel program error occurred during an I/O operation. Possible software channel program errors are:
- Program check
- Protection check
- Chaining check.

Possible channel hardware errors are:
- Channel data check
- Channel control check
- Interface control check.

**System Action:** The program performs a tape switch, retries the operation, or posts a permanent error for the I/O operation in progress.

**User Response:** For a channel program error, have your system programmer determine the cause of the error and correct it. In addition, have your system programmer display and review the CCWs. If the error is a channel hardware error, see your IBM service representative.

---

**COSK0374E** ***CP* PROGRAM CHECK ERROR ON DEVICE *cuu***

**Where:**

*cuu* The device address.

**Explanation:** A program check occurred on the device.

**System Action:** The input/output (I/O) operation ends with a permanent error.

**User Response:** Have your system programmer determine the cause of the error and correct it. In addition, have your system programmer display and review the CCWs.

---

**COSK0375E** ***CP* PROTECTION CHECK ERROR ON DEVICE** *cuu*

**Where:**

*cuu* The device address.

**Explanation:** A protection check occurred on the device.

**System Action:** The input/output (I/O) operation ends with permanent error.

**User Response:** Have your system programmer determine the cause of the error and correct it. In addition, have your system programmer display and review the CCWs.

**COSK0376E** ***CP* *nnnn* DEVICE TYPE UNKNOWN FOR DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** This message is issued when the device type cannot be determined.

**System Action:** A 00005A system error is issued and processing continues.

**User Response:** None.

See *TPF Migration Guide: Program Update Tapes* for more information about the supported device types.

**COSK0377W** ***CP* *nnnn* UNABLE TO SENSE DEVICE** *cuu*

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

**Explanation:** This message is issued when the sense data for the device cannot be obtained. This is likely a hardware error.

**System Action:** Processing continues.

**User Response:** See your IBM representative to determine the cause of the error and to correct the problem.

See *TPF Migration Guide: Program Update Tapes* for more information about the supported device types.

**COSK0381E** ***CP* *nnnn* DEVICE** *cuu* **VSN** *vvvvvv* **FILE ACTIVE UNTIL** *date*

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

*date*
The Julian date.

**Explanation:** This is an error message notifying you that an unexpired write-enabled volume was loaded on a device. If you do not wish to write over the data already on that volume, unload the tape as indicated below.

**System Action:** The volume remains loaded in the device.

**User Response:** Do one of the following:

- Enter the ZTMNT command with the BP parameter specified to mount the tape on the device.
- Enter the ZTOFF command to upload the tape.

See *TPF Operations* for more information about the ZTOFF and ZTMNT commands.

**COSL0081A** *zzzz nnnn* **MOUNT STANDBY** *yyy* **TAPE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** The control program detected an end-of-volume condition on the specified tape and attempted to start a switch operation.

**System Action:** This message is repeated at two minute intervals until the standby tape is mounted or until dismount of the active tape is forced by entering the ZTOFF command with the BP parameter specified.

If *yyy* is the RTA/RTL, polling stops and restarts automatically after the requested standby tape is mounted.

**User Response:** In the absence of a standby tape (of a suitable alternate (ALT) tape if it is an output tape), you must mount a standby tape so that the switch operation can complete.

You should guard against this by always having a standby real-time tape mounted or at least one ALT tape.

**COSL0106A** *zzzz nnnn* **REMOVE STANDBY** *yyy* **FROM DEVICE** *cuu*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

**Explanation:** See the explanation for the COSB0106A message.

**System Action:** See the system action for the COSB0106A message.

**User Response:** See the user response for the COSB0106A message.

**COSL0113A** *zzzz nnnn* **REMOVE ALT FROM DEVICE** *cuu* **VSN** *vvvvvv*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The TPF system unloaded the specified alternate (ALT) tape because during a forward switch operation the tape was not ready or at load point or input/output (I/O) errors occurred when writing standard header labels.

**System Action:** The tape is not used by the TPF system and need not be kept. The TPF system will switch to another ALT tape or will request that a standby be mounted.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COSL0324E** *zzzz nnnn* **ERROR WRITING HEADER LABELS VSN** *vvvvvv* **G** *gggg* **S***ssss* **F***ffffff ll bbbbb ccccc*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*vvvvvv*
The volume serial number (VSN).

*gggg*
The generation number.

*ssss* The sequence number.

*ffffff*
The format specification.

*ll* The label specification (SL, SU, or NL).

*bbbbb*
The blocking specification (BLK or NOBLK).

*ccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** The requested function cannot be performed on the specified device because of an input/output (I/O) error detected while writing the standard header labels. This condition can occur for any of the following reasons:

- The device does not support the specified format.
- There is a hardware malfunction of the specified device.
- The tape is damaged.

**System Action:** None.

**User Response:** Do one of the following:

- If the tape format is not supported by the specified device, try the operation again on a device that does support that format.
- If there is a hardware malfunction of the specified device, try the operation again on a different device. If this is successful, remove the device on which the error was detected from the TPF tape configuration by entering the ZTVAR command. Then, see your IBM service representative.
- If an input tape is damaged, have your system programmer recreate the tape.
- If an output tape is damaged, try the operation again with a different volume.

See *TPF Operations* for more information about the tape support commands.

---

**COS10012E** *zzzz nnnn* **INVALID FORMAT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSI0012E message.

**System Action:** See the system action for the COSI0012E message.

**User Response:** See the user response for the CO290012E message.

See *TPF Operations* for more information about the tape support commands.

---

**COS10087A** *zzzz nnnn* **REMOVE** *yyy* **FROM DEVICE** *cuu* **VSN** *vvvvvv bbbbb ccccc*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

*bbbbb*
The blocking specification (BLK or NOBLK).

*ccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** The TPF system unloaded the specified tape.

**System Action:** None.

**User Response:** Remove the tape from the drive and affix a suitable external label.

See *TPF Operations* for more information about the tape support commands.

---

**COS10097E** *zzzz nnnn* **ENTRY RESTRICTED TO BASIC SUBSYSTEM**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSI0097E message.

**System Action:** See the explanation for the COSI0097E message.

**User Response:** See the explanation for the COSI0097E message.

See *TPF Operations* for more information about the tape support commands.

---

**COS10102I** *zzzz nnnn* **CONTROL UNIT** *cu* **– DISMOUNT COMPLETE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cu* The control unit address.

**Explanation:** A request to dismount all the tapes on a given control unit has completed successfully.

**Note:** If the system dump tape was mounted on a device on the specified control unit it will not be dismounted.

**System Action:** None.

**User Response:** If required, enter the ZTOFF command to dismount the system dump tape.

See *TPF Operations* for more information about the ZTOFF command.

---

**COS10103E** *zzzz nnnn* **CONTROL UNIT** *cu* **— DISMOUNT HALTED DEVICE** *cuu* **IN USE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cu* The control unit address.

*cuu* The device address.

**Explanation:** A request to dismount all the tapes on a given control unit could not complete because it was entered while the tape routines were using one or more devices on that control unit. Some tapes on the specified control unit may have been dismounted.

**System Action:** None.

**User Response:** Enter the ZDTAP command to determine whether the command should be entered again either following completion of processing by the routines currently using the device or by specifying a different device.

See *TPF Operations* for more information about the ZDTAP command.

---

**COS10104E** *zzzz nnnn* **TAPE CONTROL UNIT** *cu* **NOT CONFIGURED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cu* The control unit address.

**Explanation:** The control unit specified in the command is not configured for the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COS10106A** *zzzz nnnn* **REMOVE STANDBY** *yyy* **FROM DEVICE** *cuu*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

**Explanation:** See the explanation for the COSB106A message.

**System Action:** See the system action for the COSB106A message.

**User Response:** See the user response for the COSB106A message.

---

**COS10108E** *zzzz nnnn* **SYSTEM NOT IN 1052 STATE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** You entered a ZTLMR INITIALIZE, DEACTIVATE, ACTIVATE, ZTOFF ALL, or ZTOCU command

or a dismount active real-time tape request when the TPF system was not in 1052 state.

**System Action:** None.

**User Response:** Do the following:

1. Cycle the TPF system to 1052 state if the requested function is required.
2. Enter the command again.

See *TPF Operations* for more information about the tape support commands.

---

**COS10109E** *zzzz nnnn* **INVALID PARAMETER CONTROL UNIT ADDRESS —** *xxxxxxxx*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*xxxxxxxx*
The user parameter that was determined not to be valid.

**Explanation:** The control unit address specified in the command was not valid.

**System Action:** None.

**User Response:** Do the following:

1. Refer to the command to determine the correct format for that message.
2. Enter the command again and specify a valid control unit address (two hexadecimal digits).

See *TPF Operations* for more information about the tape support commands.

---

**COS10126W** *zzzz nnnn* **TAPE** *yyy* **— CLOSE OR DISMOUNT ALREADY IN PROGRESS**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** This warning message is transmitted during a multiple dismount request (the ZTOFF ALL or the ZTOCU CU command) if a tape cannot be dismounted because a close or dismount operation is already in progress.

**System Action:** None.

**User Response:** When the multiple dismount completes, you should enter the ZDTAP command to determine whether or not all the tapes were dismounted as required. If not, then the command should be entered again.

See *TPF Operations* for more information about the ZDTAP command.

---

**COS30012E** *zzzz nnnn* **— INVALID FORMAT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSI0012E message.

**System Action:** See the system action for the COSI0012E message.

**User Response:** See the user response for the COSI0012E message.

# COTB–COTH

---

**COTB0098W** *zzzz nnnn* **PROT** *xxxx* **ERROR PREVENTS RECONCILIATION**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*xxxx*
FIND or FACE

**Explanation:** The Tape Restart function or the ZTVAR command was unable to retrieve the tape processor resource ownership table (PROT) because of one of the following:

- A file address compute program (FACE) error, which implies an incorrect system initialization so your system programmer should be contacted
- A FIND error and is therefore unable to perform reconciliation of the tape devices in the tape status table against the PROT, which could be due to the PROT being initialized. The system pilot tape was not loaded yet or the record may be corrupted due to system malfunction. The record ID was changed or a disk input/output (I/O) error occurred in which case a control program error message should have been issued.

**System Action:** The TPF system continues to operate, but great care should be exercised in the use of tape devices since another processor may own a tape device that is present in the tape status table of this processor.

**User Response:** Do the following:

1. Determine the cause or the probable cause of the error.
2. Have your system programmer assess the significance of bypassing the PROT record reconciliation.

The PROT should be displayed (from another processor possible) if at all possible and tape devices used with regard to ownership indicated. This option does not apply of course if the PROT is not initialized or corrupted.

---

**COTB0099W** *zzzz nnnn* **DEVICE** *cuu* **DELETED, PROT ENTRY AVAILABLE TO THIS PROCESSOR**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** Either the tape device is not in the processor resource ownership table (PROT) or is in the PROT but is owned by another processor.

**System Action:** The message is issued for a tape device not in the PROT only if there is no tape mounted on the device. If a tape is mounted then this message is followed by the COTB0100A message.

**User Response:** None.

---

**COTB0100A** *zzzz nnnn* **REMOVE** *status yyy* **VSN** *vvvvvv* **NO PATHS REMAIN**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*status*
ACTIVE or STANDBY

*yyy* The symbolic tape name.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** This message is issued after all paths to the tape have been deleted.

**System Action:** None.

**User Response:** Take the action that is appropriate for the function that uses the tape concerned.

---

**COTB0101I** *zzzz nnnn* **PROT ENTRY** *xxxxxxxx* **FOR DEVICE** *cuu* **BY THIS PROCESSOR**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*xxxxxxxx*
ADDED, ACQUIRED, FAILED, or RELEASED

*cuu* The device address.

**Explanation:** This message can have any of the following meanings and is issued by both the Tape Restart function and the Tape Reconfiguration function:

- ADDED — The device address reflected in the message was added to the processor resource ownership table (PROT) for this processor. No action is required.
- ACQUIRED — The device address reflected in the message was shown as not being owned by any processor but was acquired by this processor. No action is required.
- FAILED — The device address reflected in the message was added to the PROT because the PROT record is full. Since the PROT can hold 256 tape devices, this is most likely a system malfunction and your should contact your system programmer.
- RELEASED — This message is only issued in response to a ZTVAR command delete devices request. The device reflected in the message was in the PROT but was released by this processor. The PROT entry is released by marking the device as not being owned by any processor.

**System Action:** None.

**User Response:** None.

---

**COTB0137A** *zzzz nnnn* **RESTART HAS REMOVED GENERAL TAPES PLEASE HALT FUNCTIONS USING THEM**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** During restart, one or more general tapes were dismounted.

**System Action:** This message is displayed following one or more warning messages indicating each tape which was dismounted and the reason.

**User Response:** Take the action appropriate for the function that uses the tape concerned.

---

**COTB0138W** *zzzz nnnn* **RESTART HAS REMOVED STANDBY TAPES**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** During restart, one or more standby or alternate (ALT) tapes were dismounted.

**System Action:** This message is displayed following one or more warning messages indicating each tape that was dismounted and the reason for that dismount.

**User Response:** Take action as necessary to remount any tapes needed to comply with the operational procedures at your location.

---

**COTB0176I** *zzzz nnnn* **TAPE RESTART STARTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The TPF system is starting the Tape Restart function.

**System Action:** None.

**User Response:** None.

**COTB0177I** *zzzz nnnn* **TAPE RESTART COMPLETE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The TPF system completed the Tape Restart function.

**System Action:** None.

**User Response:** None.

**COTB0178A** *zzzz nnnn* **— TAPE RESTART COMPLETE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The TPF system has determined that tape migration has not completed for this processor.

**System Action:** Tape migration ends.

**User Response:** Enter the ZTLMR command with the CLEAR or MIGRATE parameter specified.

See *TPF Operations* for more information about the ZTLMR command.

**COTC0018I** *zzzz nnnn* **TAPE** *yyy* **DISMOUNTED VSN** *vvvvvv*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The tape specified in the message was dismounted but was not unloaded from the device.

**System Action:** None.

**User Response:** Do not remove the tape from the device.

**COTC0030W** *zzzz nnnn* **TAPE** *yyy* **— NO LABEL INFORMATION**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** While trying to dismount or switch the tape specified in the message, the TPF system was unable to retrieve tape label information.

**System Action:** None.

**User Response:** Do the following:

1. Contact your system programmer.
2. Do one of the following:
   - If the tape is an input tape then no further action is required.
   - If the tape is an output tape, then two tape marks were written in place of standard trailer labels and you should ensure that possible users of the tape are notified.

**COTC0031A** *zzzz nnnn* **DEVICE** *cuu* **LABELS NOT WRITTEN OPERATOR ACTION REQUIRED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** While trying to dismount or switch the specified output tape the TPF system was unable to write standard trailer label records because of input/output (I/O) errors.

**System Action:** None.

**User Response:** Try to write two tape marks in place of the standard trailer labels by entering the ZTWTM command. Since the I/O error condition may have caused incomplete or corrupted trailer labels to be written, you also should also ensure that possible users of the tape are notified.

See *TPF Operations* for more information about the ZTWTM command.

**COTC0087A** *zzzz nnnn* **REMOVE** *yyy* **FROM DEVICE** *cuu* **VSN** *vvvvvv bbbbb cccccc*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

*bbbbb*
The blocking specification (BLK or NOBLK).

*cccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** See the explanation for the COS10087A message.

**System Action:** See the system action for the COS10087A message.

**User Response:** See the user response for the COS10087A message.

**COTC0300A** *zzzz nnnn* **REMOVE** *yyy* **FROM DEVICE** *cuu* **VSN** *vvvvvv ggggg ssss ffffff ll bbbbb cccccc*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

*gggg*
The generation number.

*ssss* The sequence number.

*ffffff*
The format specification.

*ll* The label specification (SL, SU, or NL).

*bbbbb*
The blocking specification (BLK or NOBLK).

*cccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** The TPF system unloaded the specified tape.

**System Action:** The tape is unloaded from the device.

**User Response:** Remove the tape from the device and affix a suitable external label.

**COTC0301I** *zzzz nnnn* **TAPE** *yyy* **DISMOUNTED VSN** *vvvvvv ggggg ssss ffffff ll bbbbb cccccc*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*vvvvvv*
The volume serial number (VSN).

*gggg*
The generation number.

*ssss* The sequence number.

*ffffff*
The format specification.

*ll* The label specification (SL, SU, or NL).

*bbbbb*
The blocking specification (BLK or NOBLK).

*cccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** The tape specified in the message was removed from the device following an application program close request that suppresses unloading of the tape drive. This normally occurs when an application program recognizes that the tape will be required for another online function.

**System Action:** None.

**User Response:** No specific action is required, but depending on the operational procedures at your location, you may be required to start another function or remount the tape under the same or a different tape name.

See *TPF Operations* for more information about the tape support commands.

**COTC0302I** *zzzz nnnn* **LABEL INFORMATION FOR TAPE** *yyy* **ON DEVICE** *cuu* **VSN** *vvvvvv* **G***gggg* **S***ssss* **D***dddd ll bbbbb cccccc*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

*gggg*
The generation number.

*ssss* The sequence number.

*ffffff*
The format specification.

*ll* The label specification (SL, SU, or NL).

*bbbbb*
The blocking specification (BLK or NOBLK).

*cccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** The current tape label information was displayed.

**System Action:** The tape specified in the message was closed but not dismounted or unloaded.

**User Response:** You should note the information provided in the message because it may be required for external marking of the volume.

---

**COTD0001I DTAP — TAPE STATUS**

**Explanation:** This is the normal response to the ZDTAP command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands and an example of the tape status display.

---

**COTD0012E** *zzzz nnnn* **INVALID FORMAT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSI0012E message.

**System Action:** See the system action for the COSI0012E message.

**User Response:** See the user response for the COSI0012E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTD0037I** *zzzz nnnn* **NO ENTRIES FOUND**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** You tried to display the status of some tapes but no tapes with the specified characteristics were found in the tape status table.

**System Action:** None.

**User Response:** Enter the ZDTAP command to display the status of all configured tape devices by entering the command with no parameters or with the single parameter X.

See *TPF Operations* for more information about theZDTAP command.

---

**COTD0197E** *zzzz nnnn* **GROUP NAME** *gggggggg* **NOT DEFINED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*gggggggg*
The group name.

**Explanation:** The group specified was not defined through the ZTGRP command.

**System Action:** The TPF system issues an error message and the ECB is exited.

**User Response:** Verify that you specified the name correctly.

If you did specify the name correctly, define the group name by entering the ZTGRP command. Then, enter the ZDTAP command again and specify the previously defined group name. If no,

If you did not specify the name correctly, enter the ZDTAP command again with the correct name.

See *TPF Operations* for more information about the ZDTAP command.

---

**COTE0002I** *zzzz* **— TAPE STATUS**

**Where:**

*zzzz*
The function code from which the message originated.

**Explanation:** This is the normal response to the ZDTAP and ZTVAR commands.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTF0012E** *zzzz nnnn* **INVALID FORMAT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSI0012E message.

**System Action:** See the system action for the COSI0012E message.

**User Response:** See the user response for the COSI0012E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTF0057E** *zzzz nnnn* **DISMOUNT STANDBY** *yyy* **AND RETRY**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** You tried to dismount (by entering the ZTOFF command) an active tape without first dismounting its standby.

**System Action:** None.

**User Response:** You should dismount the standby tape before trying to dismount the active tape.

See *TPF Operations* for more information about the tape support commands.

---

**COTF0082E** *zzzz nnnn* **TAPE** *yyy* **IN USE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** The requested function cannot be performed on the specified tape because the tape routines are already using the device.

**System Action:** None.

**User Response:** Enter the command again either following completion of processing by the routines currently using the device or by specifying a different device.

See *TPF Operations* for more information about the tape support commands.

---

**COTF0085E** *zzzz nnnn* **NO STANDBY** *yyy* **MOUNTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** You tried to dismount a standby tape that is not mounted or to switch an output tape when there is no standby or suitable alternate (ALT) tape mounted.

**System Action:** None.

**User Response:** Do the following:

1. Mount a suitable standby or ALT tape, if required.
2. Enter the command again.

See *TPF Operations* for more information about the tape support commands.

---

**COTF0087A** *zzzz nnnn* **REMOVE** *yyy* **FROM DEVICE** *cuu* **VSN** *vvvvvv bbbbb cccccc*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

*bbbbb*
The blocking specification (BLK or NOBLK).

*cccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** See the explanation for the COS10087A message.

**System Action:** See the system action for the COS10087A message.

**User Response:** See the user response for the COS10087A message.

See *TPF Operations* for more information about the tape support commands.

---

**COTF0105E** *zzzz nnnn* **TAPE** *yyy* **IS OPEN**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** You tried to dismount an open active general tape (for example, the tape is still in use by an application program).

**System Action:** None.

**User Response:** If dismount really is required and if user operating practice permits, then it can be forced by entering the command again with the BP parameter specified but use this facility with extreme caution.

See *TPF Operations* for more information about the tape support commands.

---

**COTF0106A** *zzzz nnnn* **REMOVE STANDBY** *yyy* **FROM DEVICE** *cuu*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

**Explanation:** See the explanation for the COSB0106A message.

**System Action:** See the system action for the COSB0106A message.

**User Response:** See the user response for the COSB0106A message.

---

**COTF0107E** *zzzz nnnn* **TAPE** *yyy* **BEING SWITCHED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** You tried to switch or to dismount a tape that is in the process of being switched.

**System Action:** None.

**User Response:** You should wait for the switch operation complete and, if required, enter the command again. If required and if user operating practice permits, you can force a tape dismount during tape switch by entering the ZTOFF command with the BP parameter specified.

See *TPF Operations* for more information about theZTOFF command.

---

**COTF0108E** *zzzz nnnn* **SYSTEM NOT IN 1052 STATE**

**Where:**

*zzzz*
The functional code that the message originated from.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COS11008E message.

**System Action:** See the system action for the COS11008E message.

**User Response:** See the user response for the COS11008E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTF0110E** *zzzz nnnn* **TAPE** *yyy* **NOT MOUNTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** You tried to switch or to dismount a tape that is not mounted.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTF0111E** *zzzz nnnn* **BYPASS OPTION INVALID**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** A tape dismount command (the ZTOFF command) was entered with the BP parameter specified when the parameter was not required.

**System Action:** None.

**User Response:** Do the following:

1. Refer to the command to determine its correct format.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the tape support commands.

---

**COTF0112E** *zzzz nnnn* **DISMOUNT ALL HALTED DEVICE** *cuu* **IN USE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A request to dismount all tapes could not complete because it was entered while the tape routines were using one or more devices on that control unit.

**System Action:** Some tapes may have been dismounted.

**User Response:** Enter the ZDTAP command to determine whether the command should be entered again following completion of processing by the routines currently by using the device or by specifying a different device.

See *TPF Operations* for more information about theZDTAP command.

---

**COTF0114I** *zzzz nnnn* **ALL TAPES DISMOUNTED EXCEPT DUMP TAPE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** A request to dismount all tapes completed successfully.

**Note:** The system dump tape has not been dismounted.

**User Response:** Enter the ZTOFF command to dismount the system dump tape, if required.

**System Action:** None.

See *TPF Operations* for more information about the ZTOFF command.

---

**COTF0125E** *zzzz nnnn* **TAPE** *yyy* **— CLOSE OR DISMOUNT ALREADY IN PROGRESS**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** You tried to dismount a tape for which a close or dismount is already in progress.

**System Action:** None.

**User Response:** Wait for the close or dismount to complete and enter the command again, if required.

See *TPF Operations* for more information about the tape support commands.

---

**COTF0126W** *zzzz nnnn* **TAPE** *yyy* **— CLOSE OR DISMOUNT ALREADY IN PROGRESS**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** See the explanation for the COS1126W message.

**System Action:** See the system action for the COS1126W message.

**User Response:** See the user response for the COS1126W message.

See *TPF Operations* for more information about the tape support commands.

---

**COTF0204E** *zzzz nnnn* **DEVICE** *cuu* **— OPERATOR INTERVENTION REQUIRED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An error was received while trying to process a ZTOFF *cuu* command entered to a standby or alternate (ALT) tape.

**System Action:** None.

**User Response:** None.

---

**COTG0030W** *zzzz nnnn* **TAPE** *yyy* **— NO LABEL INFORMATION**

**Where:**

*zzzz*
The functional code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** See the explanation for the COTC0030W message.

**System Action:** See the system action for the COTC0030W message.

**User Response:** See the user response for the COTC0030W message.

See *TPF Operations* for more information about the tape support commands.

---

**COTG0031A** *zzzz nnnn* **DEVICE** *cuu* **LABELS NOT WRITTEN OPERATOR ACTION REQUIRED**

**Where:**

*zzzz*
The function from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COTC0031A message.

**System Action:** See the system action for the COTC0031A message.

**User Response:** See the user response for the COTC0031A message.

See *TPF Operations* for more information about the tape support commands.

---

**COTG0067W** *zzzz nnnn* **DUMPS ROUTED TO RTA TAPE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** You entered a ZTOFF RTL command.

**System Action:** The TPF system dumps were routed to the real-time (RTL) tape. As a result of the dismounting of the RTL tape, the TPF system dumps were rerouted to the primary real-time (RTA) tape.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTG0087A** *zzzz nnnn* **REMOVE** *yyy* **FROM DEVICE** *cuu* **VSN** *vvvvvv bbbbb cccccc*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

*bbbbb*
The blocking specification (BLK or NOBLK).

*cccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** See the explanation for the COS10087A message.

**System Action:** See the system action for the COS10087A message.

**User Response:** See the user response for the COS10087A message.

See *TPF Operations* for more information about the tape support commands.

---

**COTG0300A** *zzzz nnnn* **REMOVE** *yyy* **FROM DEVICE** *cuu* **VSN** *vvvvvv ggggg ssss ffffff ll cccccc*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

*ggggg*
The generation number.

*ssss* The sequence number.

*ffffff*
The format specification.

*ll* The label specification (SL, SU, or NL).

*cccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** The TPF system unloaded the specified tape.

**System Action:** The tape is unloaded from the device.

**User Response:** Remove the tape from the device and affix a suitable external label.

See *TPF Operations* for more information about the tape support commands.

---

**COTH0012E** *zzzz nnnn* **INVALID FORMAT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSI0012E message.

**System Action:** See the system action for the COS10012E message.

**User Response:** See the user response for the COS10012E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTH0044I** *zzzz nnnn* **COMPLETE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The requested function was completed successfully. No further action is necessary.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTH0092E** *zzzz nnnn* **TPLD RECORD ACTIVE — NO INITIALIZATION**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** You tried to initialize the Tape Label Directory (TPLD)/TLMR records but did not deactivated them prior to requesting the initialization.

**System Action:** None.

**User Response:** Do the following:

1. Verify that the record should be initialized because the initialization procedure is normally carried out at the time the TPF system is brought online.
2. Enter the ZTLMR command with the DEACTIVATE parameter specified to initialize the records.
3. Enter the ZTLMR command with the INITIALIZE parameter specified.

Remember, that in a multiple database function (MDBF)/loosely coupled environment, this procedure must be carried out for all subsystem users for all processors in the complex. If in doubt, see your system programmer.

See *TPF Operations* for more information about the ZTLMR command.

---

**COTH0093W** *zzzz nnnn* **TLMR ALLOCATION INSUFFICIENT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The number of Tape Label Directory (TPLD) and TLMR records in the #TPLBL fixed-file record type are defined in the TAPEQ macro as the CS9NTD and CS9NTM equates. As shipped, the TPF system has two TPLD records and 16 TLMR records.

**System Action:** If the number of TLMR records is fewer than required, the associated Tape Label Directory (TPLD) entry file address fields are initialized to zero.

If the number of TLMR records is greater than required, any excess records are not initialized.

**User Response:** This message implies that the TAPEQ values were changed without a corresponding change or with an erroneous change being made to the fixed-file record allocation. Have your system programmer verify that the records were initialized correctly.

See *TPF Operations* for more information about the tape support commands.

---

**COTH0094E** *zzzz nnnn* **SYSTEM ERROR READING LABEL INFORMATION**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSD0094E message.

**System Action:** See the system action for the COSD0094E message.

**User Response:** See the user response for the COSD0094E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTH0096E** *zzzz nnnn* **SYSTEM ERROR WRITING LABEL INFORMATION**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSD096E message.

**System Action:** See the system action for the COSD096E message.

**User Response:** See the user response for the COSD096E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTH0108E** *zzzz nnnn* **SYSTEM NOT IN 1052 STATE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COS10108E message.

**System Action:** See the system action for the COS10108E message.

**User Response:** See the user response for the COS10108E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTH0109E** *zzzz nnnn* **— SYSTEM NOT IN 1052 STATE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** This message is issued in response to the ZTLMR command with the CLEAR parameter specified.

**System Action:** The TPF system started clearing and initializing tape records.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTH0110I** *zzzz nnnn* **— SYSTEM NOT IN 1052 STATE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** This message is issued in response to the ZTLMR command with the CLEAR parameter specified.

**System Action:** The TPF system finished clearing and initializing tape records.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTH0111I** *zzzz nnnn* **— SYSTEM NOT IN 1052 STATE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** This message is issued in response to the ZTLMR command with the MIGRATE parameter specified.

**System Action:** The TPF system started migrating tape records.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTH0112I** *zzzz nnnn* **— SYSTEM NOT IN 1052 STATE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** This message is issued in response to the ZTLMR command with the MIGRATE parameter specified.

**System Action:** The TPF system finished migrating tape records.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTH0113E** *zzzz nnnn* **— SYSTEM NOT IN 1052 STATE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The TPF system was not in tape restart when you issued the ZTLMR command with the CLEAR or MIGRATE parameter specified.

**System Action:** The ZTLMR command does not complete processing.

**User Response:** Do the following:

1. Put the TPF system in tape restart.
2. Issue the ZTLMR command again with the CLEAR or MIGRATE parameter specified.

See *TPF Operations* for more information about theZTLMR command.

# COTI–COTL

---

**COTI0000E** *zzzz nnnn* **DEVICE** *cuu* **IN USE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COSI000E message.

**System Action:** See the system action for the COSI000E message.

**User Response:** See the user response for the COSI000E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTI0001E** *zzzz nnnn* **DEVICE** *cuu* **NOT READY**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The requested function cannot be performed on the specified device because the device is not ready.

**System Action:** None.

**User Response:** Do the following again:

1. Ready the device.
2. Enter the command again.

See *TPF Operations* for more information about the tape support commands.

**COTI0003E** *zzzz nnnn* **OUTPUT DEVICE** *cuu* **IS WRITE PROTECTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The requested function cannot be performed on the specified device because the volume on the device is file protected.

**System Action:** None.

**User Response:** Do the following:

1. Verify that the correct volume is on the device
2. Insert a write-enable ring before entering the command again.

See *TPF Operations* for more information about the tape support commands.

**COTI0007E** *zzzz nnnn* **BYPASS OPTION INVALID**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The bypass (BP) parameter was specified when one of the following occurred:

- It was not required
- Its use is not valid (for example, the BP parameter is not a valid parameter for the command used).

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the tape support commands.

**COTI0008W** *zzzz nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **UNEXPIRED FILE OVERWRITTEN**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The volume on the indicated drive contained an unexpired file. You initialized it or mounted it for output with the BP parameter.

**System Action:** The file was destroyed.

**User Response:** None.

**COTI0010E** *zzzz nnnn* **DEVICE** *cuu* **— INITIALIZATION FAILED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** Tape initialization failed because of a hardware error that may be caused by the:

- Tape hardware itself
- Condition of the tape volume being initialized.

A prior tape error message provides information for use by your IBM service representative. The content of the tape cannot be relied upon, so no attempt should be made to use it unless and until it is initialized successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

**COTI0012E** *zzzz nnnn* **INVALID FORMAT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSI012E message.

**System Action:** See the system action for the COSI012E message.

**User Response:** See the user response for the COSI012E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTI0013E** *zzzz nnnn* **— DEVICE** *cuu* **NOT ADDRESSABLE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A tape support command was entered, but the requested function cannot be performed on the specified device because the device is not addressable.

**System Action:** None.

**User Response:** Do the following:

1. Verify that the channel paths are varied online and that the I/O configuration definitions are correct.
2. Enter the command again.

See *TPF Operations* for more information about the tape support commands.

---

**COTI0014E** *zzzz nnnn* **NT OPTION INVALID — REJECTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The ZTINT command was entered specifying the new tape (NT) parameter.

**System Action:** The TPF system determined that the tape on specified drive contains readable data.

**User Response:** Do the following:

1. Verify that the correct volume is on the device.
2. Enter the ZTINT command again and do not specify the NT parameter.

See *TPF Operations* for more information about the ZTINT command.

---

**COTI0016E** *zzzz nnnn* **DEVICE** *cuu* **— TAPE UNREADABLE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The requested function cannot be performed on the specified device because of an input/output (I/O) error detected while reading the tape. This condition can occur because of the following:

- The tape was recorded at a format that is not supported by the specified device.
- There is a hardware malfunction of the specified device.
- The tape is damaged.

**System Action:** None.

**User Response:** Depending on the condition, do one of the following:

- If the tape format is not supported by the specified device, try the operation again on a device that supports that format.
- If there is a hardware malfunction of the specified device, try the operation again on a different device. If this is successful, remove the device on which the error was detected from the TPF tape configuration by entering the ZTVAR command. Then, see your IBM service representative.
- If an input tape is damaged, have your system programmer recreate the tape.
- If an output tape is damaged, try the operation again with a different volume.

See *TPF Operations* for more information about the ZTVAR command.

---

**COTI0058W** *zzzz nnnn* **DEVICE** *cuu* **— TAPE UNSAFE – MUST BE DEGAUSSED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** Tape initialization failed due to a hardware error that may caused by the:

- Tape hardware itself
- Condition of the tape volume being initialized.

A prior tape error message provides information for use by your IBM service representative.

**System Action:** None.

**User Response:** Since the ZTINT command was entered with the NT parameter specified and the content of the tape cannot be relied upon, the tape must be degaussed (bulk erased) or a ZTINT command entered again. Once degaussed, enter the ZTINT command and specify the NT parameter. No attempt should be made to use it until it is initialized successfully.

See *TPF Operations* for more information about the ZTINT command.

---

**COTI0127E** *zzzz nnnn* **DEVICE** *cuu* **INITIALIZATION FAILED, NO VSN AVAILABLE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The requested tape initialization could not be performed because the volume serial number was not specified in the command and there was no standard volume label already on the tape.

**System Action:** None.

**User Response:** Enter the command again including the volume serial number (VSN).

See *TPF Operations* for more information about the tape support command.

---

**COTI0292W** **TMNT** *nnnn* **INTERNAL/EXTERNAL VOLSERS MISMATCH DEV-***cuu* **INT-***intvol* **EXT-***extvol*

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*intvol*
The internal volume serial number (VSN).

*extvol*
The external volume serial number (VSN).

**Explanation:** This is a warning message to inform you that the internal and external VSNs for the volume loaded are not equal.

**System Action:** Processing continues.

**User Response:** Verify that this condition is allowed before continuing to use the volume.

---

**COTI0237E** **TINT** *nnnn* **INTERNAL/EXTERNAL VOLSERS MISMATCH DEV-***cuu* **INT-***intvol* **EXT-***extvol*

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*intvol*
The internal volume serial number (VSN).

*extvol*
The external volume serial number (VSN).

**Explanation:** A function requiring an output tape was requested but the internal and external VSNs do not match. A call to the CORU user exit indicated that the tape cannot be used for output because of this error.

**System Action:** The tape was not used for output.

**User Response:** Do one of the following:

- If you want to change the internal volume label to match the external volume label, enter the ZTINT command.
- If you want to change the external volume label to match the internal volume label, affix a new external label.

---

**COTI0288E** **TINT** *nnnn* **VSN** *vvvvvv* **IS NOT VALID FOR OUTPUT**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** An operation that requires the volume serial number (VSN) referenced in the message tried to use the tape for output but the CORU user exit prevented it.

**System Action:** The function that requires the tape was not performed.

**User Response:** Choose a volume that is authorized for output usage.

---

**COTI0295I** *zzzz nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **TAPE** *yyy* **FORMATTED TO** *ffffff*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

*ffffff*
The format specification.

**Explanation:** The format of the tape is changed to match the format that was specified or implied by the command.

**System Action:** The format of the volume is changed to the format specified.

**User Response:** None.

---

**COTI0303E** *zzzz nnnn* **DEVICE** *cuu* **INCAPABLE OF REQUESTED OR DEFAULTED FORMAT** *ffffff*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*ffffff*
The format specification.

**Explanation:** See the explanation for the COSI0303E message.

**System Action:** See the system action for the COSI0303E message.

**User Response:** See the user response for the COSI0303E message.

---

**COTI0304I** *zzzz nnnn* **DEVICE** *cuu* **INITIALIZATION COMPLETE VSN** *vvvvvv* **FORMAT** *ffffff*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

*ffffff*
The format specification.

**Explanation:** Tape initialization completed successfully.

**System Action:** The tape was initialized with the characteristics shown in the message text and is ready to be used.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTI0381E** *zzzz nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **FILE ACTIVE UNTIL** *date*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

*date*
The Julian date.

**Explanation:** You tried to initialize, or to mount for output, a volume containing an unexpired file.

**System Action:** None.

**User Response:** If the file is not needed and user operating practice permits, enter the command again and specify the BP parameter to overwrite the file.

If the expiration date is specified as *****, the TPF system was unable to determine the expiration date of the file because the tape belongs to a SSU in a subsystem that is not available or the tape belongs to other than a subsystem (OS/VS for example) and the TPF system clock fields were not yet initialized. You should use a different tape or determine if the file has expired by examining any external labels on the volume before using the BP parameter.

See *TPF Operations* for more information about the tape support commands.

---

**COTJ0007E** *zzzz nnnn* **BYPASS OPTION INVALID**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COTI0007E message.

**System Action:** See the system action for the COTI0007E message.

**User Response:** See the user response for the COTI0007E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTJ0012E** *zzzz nnnn* **INVALID FORMAT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSI0012E message.

**System Action:** See the system action for the COSI0012E message.

**User Response:** See the user response for the COSI0012E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTJ0068E** *zzzz nnnn* **TAPE NAME** *yyy* **INVALID**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** See the explanation for the COSI0068E message.

**System Action:** See the system action for the COSI0068E message.

**User Response:** See the user response for the COSI0068E message.

See *TPF Operations* for more information about the tape support commands.

**COTJ0071E** *zzzz nnnn* **ACTIVE** *yyy* **MOUNTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** You tried to change tape label information (by entering the ZTLBL command) while the tape is mounted.

**System Action:** None.

**User Response:** Wait until processing of the specified tape completes before entering the command again.

If operational procedures at your location permit, enter the command again with the BP parameter specified to allow the tape label information alteration while the tape is mounted.

**Note:** If the tape label information is changed while the tape is mounted, it may be difficult or impossible to process the tape for input.

See *TPF Operations* for more information about the tape support commands.

**COTJ0072E** *zzzz nnnn* **TAPE** *yyy* **— NO LABEL INFORMATION**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** The TPF system was unable to retrieve label information for the specified tape when you tried to:

- Display tape label information (by entering the ZDTLB command). If required, create label information for the specified tape by entering the ZTLBL command.
- Change tape label information (by entering the ZTLBL command). If required, create label information for the specified tape by entering the ZTLBL command with the C parameter specified.
- Mount a tape (by entering the ZTMNT command). Create label information for the specified tape by entering the ZTLBL command.
- Remount a tape (by entering the ZTRMT command). This is a serious system error and should not occur. If this error occurs, see your system programmer for more information.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

**COTJ0073E** *zzzz nnnn* **TAPE** *yyy* **LABEL INFORMATION ALREADY EXISTS**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** An attempt was made to create label information for the specified tape but label information already exists.

**System Action:** None.

**User Response:** Enter the ZDTLB command to display the existing label information. If required, it may then be changed by entering the ZTLBL command with the A parameter specified.

See *TPF Operations* for more information about the ZDTLB and ZTLBL commands.

**COTJ0074E** *zzzz nnnn* **NO SPACE IN TAPE LABEL DIRECTORY**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** An attempt was made to create label information for the specified tape but there is no space left in the Tape Label Directory (TPLD) fixed-file record s0 (record type #TLDMR).

**System Action:** None.

**User Response:** Have your system programmer delete label information for one or more infrequently used tape names (by entering the ZTLBL command with the D parameter) before the command can be entered again.

See *TPF Operations* for more information about theZTLBL command.

---

**COTJ0075E** *zzzz nnnn* **TAPE** *yyy* **INVALID PARAMETER – *xxxxxxxx***

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*xxxxxxxx*
The user parameter that was determined not to be valid.

**Explanation:** The ZTLBL command was entered with a parameter specified that is not valid. A maximum of eight bytes of the parameter in error is included in the error message.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the tape support commands.

---

**COTJ0076E** *zzzz nnnn* **TAPE** *yyy* **MUST BE OUTPUT SL**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** The tape label information for a real-time (RTL) tape must specify SL and output.

**System Action:** None.

**User Response:** Do the following:

1. Correct the label information by entering the ZTLBL command with the A parameter specified.
2. Enter the command again.

See *TPF Operations* for more information about the ZTLBL command.

---

**COTJ0078E** *zzzz nnnn* **TAPE** *yyy* **— CONFLICTING OPTIONS OUTPUT TAPES CANNOT BE NL**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** The tape label information for an output tape must specify SL.

**System Action:** None.

**User Response:** Do the following:

1. Correct the label information by entering the ZTLBL command with the A parameter specified.
2. Enter the command again.

See *TPF Operations* for more information about the ZTLBL command.

---

**COTJ0313I** *zzzz nnnn* **TAPE** *yyy* **LABEL USABLE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** The requested function was completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTJ0314I** *zzzz nnnn* **TAPE** *yyy* **LABEL DELETED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** The requested function was completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTK0012E** *zzzz nnnn* **INVALID FORMAT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSI0012E message.

**System Action:** See the system action for the COSI0012E message.

**User Response:** See the user response for the COSI0012E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTK0062E** *zzzz nnnn* **TAPE** *yyy* **INVALID PARAMETER GENERATION —** *xxxxxxx*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* Symbolic tape name

*xxxxxxxx*
User parameter that was determined to be invalid

**Explanation:** When creating or changing tape label information (by entering the ZTLBL command) a generation number parameter was specified that is not valid. This parameter must be specified as a decimal number greater than 0.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the tape support commands.

---

**COTK0064E** *zzzz nnnn* **TAPE** *yyy* **INVALID PARAMETER LABEL TYPE –** *xxxxxxx*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*xxxxxxxx*
The user parameter that was determined not to be valid.

**Explanation:** When creating or changing tape label information (by entering the ZTLBL command) a label type parameter was specified that is not valid. This parameter must be specified as LSL, LSU, or LNL.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the tape support commands.

---

**COTK0065E** *zzzz nnnn* **TAPE** *yyy* **INVALID PARAMETER RETENTION PERIOD —** *xxxxxxxx*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*xxxxxxxx*
The user parameter that was determined not to be valid.

**Explanation:** When creating or changing tape label information (by entering the ZTLBL command) a retention period parameter was specified that is not valid. This parameter must be specified as a decimal number less than 366.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the tape support commands.

---

**COTK0066E** *zzzz nnnn* **TAPE** *yyy* **INVALID PARAMETER VOLUME SEQUENCE —** *xxxxxxxx*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*xxxxxxxx*
The user parameter that was determined not to be valid.

**Explanation:** When creating or changing tape label information (by entering the ZTLBL command) a volume sequence number parameter was specified that is not valid. This parameter must be specified as a decimal number greater than 0.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the tape support commands.

---

**COTK0075E** *zzzz nnnn* **TAPE** *yyy* **INVALID PARAMETER —** *xxxxxxxx*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*xxxxxxxx*
The user parameter that was determined not to be valid.

**Explanation:** See the explanation for the COTJ0075E message.

**System Action:** See the system action for the COTJ0075E message.

**User Response:** See the user response for the COTJ0075E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTK0077E** *zzzz nnnn* **TAPE** *yyy* **PARAMETER TOO LONG —** *xxxxxxxx*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*xxxxxxxx*
The user parameter that was determined not to be valid.

**Explanation:** The ZTLBL command was entered with a parameter that is too long. A maximum of eight bytes of the parameter in error is included in the error message.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the tape support commands.

---

**COTK0088E** *zzzz nnnn* **TAPE** *yyy* **INVALID PARAMETER TIME —** *ttt*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*ttt* Time (in seconds) that data is allowed to remain in the host buffer.

**Explanation:** When creating or changing tape label information by entering the ZTLBL command, a time parameter was specified that is not valid. This parameter must be specified as a decimal number between 0 and 255, inclusive. If omitted, the default value is 0.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the tape support commands.

---

**COTK0193E** *zzzz nnnn* **TAPE** *yyy* **GROUP NAME** *gggggggg* **NOT DEFINED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*gggggggg*
The group name.

**Explanation:** The group specified was not defined through the ZTGRP command.

**System Action:** An error message is issued and the ECB is exited.

**User Response:** Do the following:

1. Define the group name by entering the ZTGRP command.
2. Enter the ZTLBL command again.

See *TPF Operations* for more information about the ZTLBL command.

---

**COTK0305E** *zzzz nnnn* **TAPE** *yyy* **INVALID PARAMETER FORMAT –** *xxxxxxxx*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*xxxxxxxx*
The user parameter that was not valid.

**Explanation:** When creating or changing tape label information (by entering the ZTLBL command), the format was not valid or a format was specified that is not supported by the TPF system.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the tape support commands.

**COTK0373E** *zzzz nnnn* **— TAPE** *yyy* **INVALID FILE ID OR TAPE FORMAT PARAMETER**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** A tape support command was entered, but the file ID or tape format specified is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a valid file ID or tape format.

See *TPF Operations* for more information about the tape support commands.

**COTL0002I DTLB** *nnnn* **— TAPE LABEL INFORMATION**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** This is the normal response to the ZDTLB command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

**COTL0072E** *zzzz nnnn* **TAPE** *yyy* **— NO LABEL INFORMATION**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COTJ0072E message.

**System Action:** See the system action for the COTJ0072E message.

**User Response:** See the user response for the COTJ0072E message.

See *TPF Operations* for more information about the tape support commands.

# COTM

**COTM0000E** *zzzz nnnn* **DEVICE** *cuu* **IN USE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COSI0000E message.

**System Action:** See the system action for the COSI0000E message.

**User Response:** See the user response for the COSI0000E message.

See *TPF Operations* for more information about the tape support commands.

**COTM0001E** *zzzz nnnn* **DEVICE** *cuu* **NOT READY**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COTI0001E message.

**System Action:** See the system action for the COTI0001E message.

**User Response:** See the user response for the COTI0001E message.

See *TPF Operations* for more information about the tape support commands.

**COTM0005E** *zzzz nnnn* **DEVICE** *cuu* **HAS NO VOL1 LABEL — INITIALIZE TAPE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A request to mount an output tape was issued indicating a device that has an unlabeled tape on it.

**System Action:** None.

**User Response:** Do the following:

1. Verify that the correct volume is on the device.
2. Enter the ZTINT command to initialize the tape.
3. Enter the command again.

See *TPF Operations* for more information about the ZTINT command.

---

**COTM0007E** *zzzz nnnn* **BYPASS OPTION INVALID**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COTI0007E message.

**System Action:** See the system response for the COTI0007E message.

**User Response:** See the user response for the COTI0007E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0008W** *zzzz nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **UNEXPIRED FILE OVERWRITTEN**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** See the explanation for the COTI0008W message.

**System Action:** See the system action for the COTI0008W message.

**User Response:** See the user response for the COTI0008W message.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0009E** *zzzz nnnn* **TAPE SWITCH OCCURRED DURING STANDBY** *yyy* **MOUNT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** A tape switch has occurred while this standby mount was being processed.

**System Action:** The mount is rejected and the cartridge is unloaded from the device. Header labels have been written to the cartridge.

**User Response:** Enter the tape command again if a standby tape is still needed.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0011E** *zzzz nnnn* **TAPE** *yyy* **— BLOCKING PARAMETER NOT ALLOWED TAPE IS STANDBY OR ALT TAPE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** A tape mount command was entered indicating a blocking parameter (BLK or NOBLK) for a standby or alternate (ALT) tape, which is not allowed.

**System Action:** None.

**User Response:** Enter the command again, omitting the blocking parameter. The blocking mode is determined by the control program when the tape is converted to an active tape.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0013E** *zzzz nnnn* **DEVICE** *cuu* **NOT ADDRESSABLE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COTI0013E message.

**System Action:** See the system action for the COTI0013E message.

**User Response:** See the system action for the COTI0013E.

---

**COTM0015E** *zzzz nnnn* **STANDBY** *yyy* **ALREADY MOUNTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** The requested mount of cannot be performed because a standby tape with the specified name is already mounted.

**System Action:** None.

**User Response:** none.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0016E** *zzzz nnnn* **DEVICE** *cuu* **— TAPE UNREADABLE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COTI0016E message.

**System Action:** See the system action for the COTI0016E message.

**User Response:** See the user response for the COTI0016E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0017E** *zzzz nnnn* **ACTIVE** *yyy* **ALREADY MOUNTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** The requested mount cannot be performed because an active tape with the specified name is already mounted.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0019E** *zzzz nnnn* **LABEL RECORD FOR** *yyy* **NOT USABLE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** A command was entered to mount a tape for which tape label information exists but was not made usable yet.

**System Action:** None.

**User Response:** Do the following:

1. Ensure that the label information is correct by entering the ZDTLB command.
2. Correct the label information, if necessary, and lag the label information usable by entering the ZTLBL command
3. Enter the mount request again.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0020E** *zzzz nnnn* **DEVICE** *cuu* **FILE PROTECT STATUS CONFLICTS WITH ACTIVE TAPE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An active tape is mounted and an attempt has been made to mount a standby. However, the file protect status of the standby tape does not match that of the active tape.

**System Action:** None.

**User Response:** Do the following:

1. Ensure that the correct volume is mounted on the device.
2. Make the volume write-protected (if input) or write-enabled (if output).
3. Enter the mount request again.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0021I** *zzzz nnnn* **DEVICE** *cuu* **TAPE** *yyy* **IS SL**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuue*
The device address.

*yyy* The symbolic tape name.

**Explanation:** You mounted an output tape. All output tapes generated by the TPF system have standard volume and header labels. The label information for the specified tape indicates that it can be mounted for either output or input but that when mounted for input it should have no labels.

**System Action:** The labeled tape is accepted and processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

**COTM0022E** *zzzz nnnn* **TAPE** *yyy* **HDR1 LABEL ERROR**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** The requested function cannot be performed because of one or more errors detected during standard header label processing. This message is displayed following one or more warning messages listing the errors that were detected.

**System Action:** None.

**User Response:** Ensure that the correct tape is loaded on the device and verify that the label information is correct (by entering the ZDTLB command).

If the label information is not correct you should modify it (by entering the ZTLBL command) and then enter the command again.

If the input message was a mount command and operational procedures at your location permit, you should enter the command again and specify the BP parameter to ignore the errors.

See *TPF Operations* for more information about the ZTLBL and ZDTLB commands.

---

**COTM0024E** *zzzz nnnn* **DEVICE** *cuu* **FILE PROTECT STATUS CONFLICTS WITH REQUESTED FUNCTION**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** You requested that a file-protected volume be mounted for output or an unprotected volume be mounted for input.

**Note:** If no input/output (I/O) status parameter is specified the tape mount request assumes output by default.

**System Action:** None.

**User Response:** Do the following:

1. Ensure that the correct volume is mounted on the device.
2. Make the volume write-protected (if input) or write-enabled (if output).
3. Enter the mount request again.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0025E** *zzzz nnnn* **TAPE** *yyy* **WRONG I/O SPECIFICATION**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** You requested that a tape be mounted as output when the tape label information specifies input or that a tape be mounted as input when the tape label information specifies output.

**Note:** If no input/output (I/O) status parameter is specified, the tape mount request assumes output by default.

**System Action:** None.

**User Response:** Do one of the following:

- If the tape label information is correct, enter the command again with the correct I/O status parameter.
- If the tape label information is not correct, do the following:
  1. Enter the ZTLBL command to correct the information and to flag it as usable.
  2. Enter the command again.

See *TPF Operations* for more information about the ZTLBL command.

---

**COTM0026E** *zzzz nnnn* **DEVICE** *cuu* **TAPE** *yyy* **– NO HDR1 LABEL**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*yyy* The symbolic tape name.

**Explanation:** A tape mount or remount request was entered. The tape label information indicates that the tape should have standard labels but there is no Header 1 label record on the tape.

**System Action:** None.

**User Response:** If the command entered was a mount command and the operation procedures at you location permit, enter the command again and specify the BP parameter to ignore this error.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0027W** *zzzz nnnn* **DEVICE** *cuu* **TAPE** *yyy* **– NO HDR1 LABEL**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*yyy* The symbolic tape name.

**Explanation:** A tape mount request was entered with the BP parameter specified. The tape label information indicates that the tape should have standard labels but there is no Header 1 label record on the tape.

**System Action:** Processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0029E** *zzzz nnnn* **TAPE** *yyy* **— NL OPTION INVALID**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** A tape mount request for an output tape was entered with the NL parameter specified. Output tapes may only be standard label.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZTINT command again omitting the NL parameter.
2. If the tape does not have a standard volume label, initialize the tape by entering the ZTINT command. Otherwise, ignore this step.

See *TPF Operations* for more information about the ZTINT command.

---

**COTM0034E** *zzzz nnnn* **TAPE** *yyy* **IS UNLABELED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** You tried to mount a tape without standard volume and header labels but one of the following errors occurred:

- The label information for the specified tape indicates that it should have standard labels. Ensure that the correct volume is on the device. Then, enter the command again and specify the NL parameter.
- The command specified the SL parameter. Ensure that the correct volume is on the device. Then, enter the command again and do not specify the SL parameter.

**Note:** Unlabeled tapes cannot be mounted by entering the ZTRMT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTRMT command.

---

**COTM0035W** *zzzz nnnn* **TAPE** *yyy* **IS UNLABELED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** You forced the mount of a tape without standard volume and header labels by entering the ZTMNT command with the NL parameter specified. The label information for the specified tape indicates that it should have standard labels.

**System Action:** The labeled tape is accepted and processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0040W** *zzzz nnnn* **DEVICE** *cuu* **— WRONG BLOCKING FORMAT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The blocking mode specified by the HDR2 label does not agree with the default or specified blocking format on the ZTMNT command.

**System Action:** This message is followed by the COTM0120E, COTM0130W, COTR0120E, or COTR0130W messages.

**User Response:** Do the following:

1. Verify that the correct tape is mounted.
2. Enter the command again.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0050W** *zzzz nnnn* **DEVICE** *cuu* **— WRONG FILE SERIAL NUMBER SHOULD BE** *ffffff*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*ffffff*
The file serial number.

**Explanation:** During processing of a tape mount, the ready or remount the tape file serial number was checked against the TLMR and found to be incorrect.

**System Action:** None.

**User Response:** Do the following:

1. Mount the correct tape.
2. Enter the command again.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0051W** *zzzz nnnn* **DEVICE** *cuu* **— WRONG FILE ID**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** During processing of a tape mount, ready or remount the tape data set (file) ID, SSU name and the BSS name were checked against the TLMR record and one or more were found to be incorrect.

**System Action:** None.

**User Response:** Do the following:

1. Mount the correct tape.
2. Enter the command again.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0052W** *zzzz nnnn* **DEVICE** *cuu* **— WRONG GENERATION SHOULD BE** *gggg*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*gggg*
The generation number.

**Explanation:** During processing of a tape mount/remount request, the tape generation was checked against the TLMR and found to be incorrect.

**System Action:** None.

**User Response:** Do the following:

1. Mount the correct tape.
2. Enter the command again.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0053W** *zzzz nnnn* **DEVICE** *cuu* **— WRONG VOLUME SEQUENCE SHOULD BE** *ssss*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*ssss* The sequence number.

**Explanation:** During processing of a tape mount, the ready or remount the tape volume sequence number was checked against the TLMR and found to be incorrect.

**System Action:** None.

**User Response:** Do the following:

1. Mount the correct tape.
2. Enter the command again.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0055E** *zzzz nnnn* **TAPE** *yyy* **MUST FIRST BE MOUNTED AS ACTIVE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** You tried to mount a standby tape without first mounting the corresponding active tape.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0059E** *zzzz nnnn* **TAPE ALT MUST BE MOUNTED AS ACTIVE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** An attempt was made to mount an alternate (ALT) tape as standby. ALT tapes may only be mounted as active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

**COTM0068E** *zzzz nnnn* **TAPE NAME** *yyy* **INVALID**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** See the explanation for the COSI0068E message.

**System Action:** See the system action for the COSI0068E message.

**User Response:** See the user response for the COSI0068E message.

See *TPF Operations* for more information about the tape support commands.

**COTM0069E** *zzzz nnnn* **TAPE** *yyy* **INVALID — BACKWARD TAPE SWITCH IN PROGRESS**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** You tried to mount a tape while a backward switch of that tape is in progress.

**System Action:** None.

**User Response:** If necessary, enter the command again when the switch has completed.

See *TPF Operations* for more information about the tape support commands.

**COTM0070W** *zzzz nnnn* **DUMPS ROUTED TO RTL TAPE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** You entered a ZTMNT RTL command. As a result of a previous ZTOFF RTL command, the system dumps were rerouted to the primary real-time (RTA) tape.

**System Action:** The system dumps are now routed back to the real-time (RTL) tape.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

**COTM0072E** *zzzz nnnn* **TAPE** *yyy* **— NO LABEL INFORMATION**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** See the explanation for the COTJ0072E message.

**System Action:** See the system action for the COTJ0072E message.

**User Response:** See the user response for the COTJ0072E message.

See *TPF Operations* for more information about the tape support commands.

**COTM0074E** *zzzz nnnn* **NO SPACE IN TAPE LABEL DIRECTORY**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COTJ0074E message.

**System Action:** See the system action for the COTJ0074E message.

**User Response:** See the user response for the COTJ0074E message.

See *TPF Operations* for more information about the tape support commands.

**COTM0120E** *zzzz nnnn* **TAPE** *yyy* **HDR2 LABEL ERROR**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** The requested function cannot be performed because one or more errors were detected during standard HDR2 label processing. This message is displayed following one or more warning messages listing the errors that were detected.

**System Action:** None.

**User Response:** Ensure that the correct tape is loaded on the device and verify that the label information is correct (by entering the ZDTLB command).

If the label information is not correct, modify it (by entering the ZTLBL command) and then entering the command again.

If the command was a mount command, and the operating procedures at your location permit, enter the command again and specify the BP parameter to ignore the errors.

See *TPF Operations* for more information about theZDTLB and ZTLBL commands.

---

**COTM0130W** *zzzz nnnn* **TAPE** *yyy* **HDR2 LABEL ERROR**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** A tape mount command with the BP parameter specified was entered to force mounting of a tape on which one or more errors were detected during standard HDR2 label processing. This message is displayed following one or more warning messages listing the errors that were detected.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0147E** *zzzz nnnn* **DEVICE** *cuu* **TAPE** *yyy* **— NO HDR2 LABEL**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*yyy* The symbolic tape name.

**Explanation:** A tape mount or remount request was entered. The tape label information indicates that the tape should have standard labels but there is no HDR2 label on the tape.

**System Action:** None.

**User Response:** If the command was a mount command, and the operating procedures at your location permit, enter the command again and specify the BP parameter to ignore this error.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0150W** *zzzz nnnn* **DEVICE** *cuu* **TAPE** *yyy* **— NO HDR2 LABEL**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*yyy* The symbolic tape name.

**Explanation:** A tape mount command was entered with the BP parameter specified. The tape label information indicates that the tape should have standard labels but there is no HDR2 label on the tape.

**System Action:** Processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0162E** *zzzz nnnn* **TSTB ENTRY CORRUPTED — MOUNT ABORTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The tape status table item for a tape currently being mounted was corrupted.

**System Action:** The mount is aborted.

**User Response:** Enter the mount request again.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0165E** *zzzz nnnn* **STANDBY** *yyy* **DEVICE TYPE CONFLICTS WITH ACTIVE TAPE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** You tried to mount a standby tape that is of a different device type than the current active tape. The device type of both the active and standby tape must be the same.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0172E** *zzzz nnnn* **DEVICE** *cuu* **NOT CAPABLE OF OPERATING IN COMPACTION MODE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The ZTMNT command was entered with the COMP parameter specified to mount a tape that will be written in compacted mode. To use the COMP parameter, the tape must be mounted on a device that has the improved data recording capability (IDRC) feature; however, the device specified with this command entry does not have the IDRC feature installed and enabled.

**System Action:** None.

**User Response:** Enter the ZTMNT command again and specify a device that has the IDRC feature installed and enabled.

See *TPF Operations* for more information about the ZTMNT command and other tape support commands.

---

**COTM0173E** *zzzz nnnn* **TAPE** *yyy* **COMPACTION PARAMETER NOT ALLOWED TAPE IS INPUT, STANDBY, OR ALT TAPE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** A tape mount command was entered with a compaction parameter (COMP or NOCOMP) specified for an input, standby, or alternate (ALT) tape that is not allowed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0188W** *zzzz nnnn* **NONSTANDARD TAPE LABEL DETECTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** A nonstandard tape label was detected.

**System Action:** Since the BP parameter is not specified on the command, the tape is mounted and positioned at the start of the nonstandard label.

**User Response:** Create the tape again with standard labels. Although the BP parameter ignores nonstandard labels, the application program may not.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0189E** *zzzz nnnn* **NONSTANDARD TAPE LABEL DETECTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** A nonstandard tape label was detected.

**System Action:** Since the BP parameter was not specified on the command, the mount is aborted.

**User Response:** Create the tape again with standard labels. Although the BP parameter ignores nonstandard labels, the application program may not.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0192E** *zzzz nnnn* **RTL MOUNT REJECTED RTA/RTL OUTPUT MERGED TO RTA TAPE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The real-time (RTL) tape mount was rejected. An RTL tape cannot be mounted when real-time output is merged to the primary real-time (RTA) tape.

**System Action:** None.

**User Response:** None.

---

**COTM0194E** *zzzz nnnn* **OVERLAY OPTION INVALID**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** An attempt was made to mount a tape by using the overlay parameter and an alternate (ALT) tape was not currently mounted on the device.

**System Action:** The ECB is exited.

**User Response:** Do one of the following:

- Enter the ZTMNT command again and do not specify the overlay parameter.
- Select a device that has an ALT tape mounted on it.

See *TPF Operations* for more information about the ZTMNT command.

---

**COTM0237E** **TMNT** *nnnn* **INTERNAL/EXTERNAL VOLSERS MISMATCH DEV–***cuu* **INT–***intvol* **EXT–***extvol*

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*intvol*
The internal volume serial number (VSN).

*extvol*
The external volume serial number (VSN).

**Explanation:** A function that requires an output tape was requested but the internal and external VSNs do not match. A call to the CORU user exit indicated that the tape cannot be used for output because of this error.

**System Action:** The tape was not used for output.

**User Response:** Do one of the following:

- If you want to change the internal volume label to match the external volume label, enter the ZTINT command.
- If you want to change the external volume label to match the internal volume label, affix a new external label.

---

**COTM0288E** **TMNT** *nnnn* **VSN** *vvvvvv* **IS NOT VALID FOR OUTPUT**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** An operation that requires the VSN referenced in the message tried to use the tape for output but the CORU user exit prevented it.

**System Action:** The function requiring the tape was not performed.

**User Response:** Choose a volume that is authorized for output usage.

---

**COTM0292W** **TMNT** *nnnn* **INTERNAL/EXTERNAL VOLSERS MISMATCH DEV-***cuu* **INT-***intvol* **EXT-***extvol*

**Where:**

*nnnn*
The subsystem user (SSU) name.

*cuu* The device address.

*intvol*
The internal volume serial number (VSN).

*extvol*
The external volume serial number (VSN).

**Explanation:** See the explanation for the COTI0292W message.

**System Action:** See the system action for the COTI0292W message.

**User Response:** See the user response for the COTI0292W message.

---

**COTM0295I** *zzzz nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **TAPE** *yyy* **FORMATTED TO** *ffffff*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

*ffffff*
The format specification.

**Explanation:** The format of the tape is changed to match the format that was specified or implied by the command.

**System Action:** The format of the volume is changed to the format specified.

**User Response:** None.

---

**COTM0303E** *zzzz nnnn* **DEVICE** *cuu* **INCAPABLE OF REQUESTED OR DEFAULTED FORMAT** *ffffff*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*ffffff*
The format specification.

**Explanation:** See the explanation for the COSI0303E message.

**System Action:** See the system action for the COSI0303E message.

**User Response:** See the user response for the COSI0303E message.

---

**COTM0306W** *zzzz nnnn* **TAPE** *yyy* **HDR1 LABEL ERROR VSN** *vvvvvv* **G***gggg* **S***ssss* **F***ffffff ll bbbbb cccccc*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*vvvvvv*
The volume serial number (VSN).

*gggg*
The generation number.

*ssss* The sequence number.

*ffffff*
The format specification.

*ll* The label specification (SL, SU, or NL).

*bbbbb*
The blocking specification (BLK or NOBLK).

*cccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** The ZTMNT command was entered with the BP parameter to force mounting a tape on which one or more errors were detected during standard header label processing. This message is displayed following one or more warning messages listing the errors that were detected.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTMNT command.

---

**COTM0307E** *zzzz nnnn* **TAPE** *yyy* **IS LABELED VSN** *vvvvvv* **G***gggg* **S***ssss* **F***ffffff ll bbbbb cccccc*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*vvvvvv*
The volume serial number (VSN).

*gggg*
The generation number.

*ssss* The sequence number.

*ffffff*
The format specification.

*ll* The label specification (SL, SU, or NL).

*bbbbb*
The blocking specification (BLK or NOBLK).

*cccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** You tried to mount a tape with standard volume and header labels but one of the following errors occurred:

- The label information for the specified tape indicates that it should have no labels.
- The command specified the NL parameter.

**System Action:** None.

**User Response:** Depending on the condition, do one of the following:

- If the tape does not have labels, enter the command again on the device that has the correct volume and specify the SL parameter.
- If the command was entered with the NL parameter specified, enter the command again and do not specify the NL parameter on the device that has the correct volume.

See *TPF Operations* for more information about the tape support command.

---

**COTM0308W** *zzzz nnnn* **TAPE** *yyy* **IS LABELED VSN** *vvvvvv* **G***gggg* **S***ssss* **F***ffffff ll bbbbb cccccc*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*vvvvvv*
The volume serial number (VSN).

*gggg*
The generation number.

*ssss* The sequence number.

*ffffff*
The format specification.

*ll* The label specification (SL, SU, or NL).

*bbbbb*
The blocking specification (BLK or NOBLK).

*cccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** You forced the mount of a tape with standard volume and header labels by entering the ZTMNT command with the SL parameter specified. The label information for the

specified tape indicates that it should have no labels.

**System Action:** The labeled tape is accepted and processing continues.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTM0309E** *zzzz nnnn* **DEVICE** *cuu* **TAPE** *yyy* **FORMAT CONFLICT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*yyy* The symbolic tape name.

**Explanation:** You tried to mount a tape but one of the following errors occurred:

- The format indicated in the label information does not match the format of the tape on the specified device.
- The format of the active tape does not match the format of the tape on the specified device.

**System Action:** None.

**User Response:** Depending on the condition, do one of the following:

- If the format indicated in the label information does not match the format of the tape on the specified device, try the operation again and ensure that the correct volume is on the device. If necessary, enter the ZTINT command (for output tapes only) to initialize the tape at the required format or enter the ZTLBL command to change the format indicated in the label information and then try the command again.
- If the format of the active tape does not match the format of the tape on the specified device, try the operation again and ensure that the correct volume is on the device. If necessary, enter the ZTINT command to initialize the tape at the required format and then enter the command again.

See *TPF Operations* for more information about the ZTINT and ZTLBL commands.

---

**COTM0310I** *zzzz nnnn* **TAPE** *yyy* **MOUNTED ON DEVICE** *cuu* **VSN** *vvvvvv* **G***gggg* **S***ssss* **F***ffffff ll bbbbb ccccc*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

*gggg*
The generation number.

*ssss* The sequence number.

*ffffff*
The format specification.

*ll* The label specification (SL, SU, or NL).

*bbbbb*
The blocking specification (BLK or NOBLK).

*ccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** This is the normal response to the ZTMNT command.

**System Action:** The specified tape is mounted successfully on the requested device.

**User Response:** None.

See *TPF Operations* for more information about the ZTMNT command and other tape support commands.

---

**COTM0311E** *zzzz nnnn* **ERROR WRITING HEADER LABELS VSN** *vvvvvv* **G***gggg* **S***ssss* **F***ffffff ll bbbbb ccccc*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*vvvvvv*
The volume serial number (VSN).

*gggg*
The generation number.

*ssss* The sequence number.

*ffffff*
The format specification.

*ll* The label specification (SL, SU, or NL).

*bbbbb*
The blocking specification (BLK or NOBLK).

*ccccc*
The compaction specification (COMP or NOCOMP).

**Explanation:** The requested function cannot be performed on the specified device because of an input/output (I/O) error detected while writing the standard header labels. This condition can occur for any of the following reasons:

- The device does not support the specified format.
- There is a hardware malfunction of the specified device.
- The tape is damaged.

**System Action:** None.

**User Response:** Do one of the following:

- If the tape format is not supported by the specified device, try the operation again on a device that does support that format.
- If there is a hardware malfunction of the specified device, try the operation again on a different device. If this is successful, remove the device on which the error was detected from the TPF tape configuration by entering the ZTVAR command. Then, see your IBM service representative.
- If an input tape is damaged, have your system programmer recreate the tape.
- If an output tape is damaged, try the operation again with a different volume.

See *TPF Operations* for more information about theZTVAR command.

---

**COTM0312E** *zzzz nnnn* **DEVICE** *cuu* **REQUIRED SUBSYSTEM FUNCTION HAS FAILED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An inhibit extended recovery function or enable extended recovery function that is required by the TPF system has failed on the device.

**System Action:** The device is removed from the configuration.

**User Response:** Verify that the devices are at the correct licensed internal code (LIC) levels.

See the *TPF Migration Guide: Program Update Tapes* for more information about which levels of code and software programs to install on your devices.

---

**COTM0381E** *zzzz nnnn* **DEVICE** *cuu* **VSN** *vvvvvv* **FILE ACTIVE UNTIL** *date*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

*yyddd*
The Julian date.

**Explanation:** See the explanation for the COTI381E message.

**System Action:** See the system action for the COTI381E message.

**User Response:** See the user response for the COTI381E message.

See *TPF Operations* for more information about the tape support commands.

# COTO–COTS

**COTO0000E** *zzzz nnnn* **DEVICE** *cuu* **IN USE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COSI0000E message.

**System Action:** See the system action for the COSI0000E message.

**User Response:** See the user response for the COSI0000E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTO0001E** *zzzz nnnn* **DEVICE** *cuu* **NOT READY**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the to the explanation for the COTI0001E message.

**System Action:** See the system action for the COTI0001E message.

**User Response:** See the user response for the COTI0001E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTO0003E** *zzzz nnnn* **OUTPUT DEVICE** *cuu* **IS WRITE PROTECTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COTI0003E message.

**System Action:** See the system action for the COTI0003E message.

**User Response:** See the user response for the COTI0003E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTO0012E** *zzzz nnnn* **INVALID FORMAT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COTI0012E message.

**System Action:** See the system action for the COTI0012E message.

**User Response:** See the user response for the COTI0012E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTO0013E** *zzzz nnnn* **DEVICE** *cuu* **NOT ADDRESSABLE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COTM0013E message.

**System Action:** See the system action for the COTM0013E message.

**User Response:** See the user response for the COTM0013E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTO0044I** *zzzz nnnn* **COMPLETE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COTH0044I message.

**System Action:** See the system action for the COTH0044I message.

**User Response:** See the user response for the COTH0044I message.

See *TPF Operations* for more information about the tape support commands.

---

**COTO0047E** *zzzz nnnn* **DEVICE** *cuu* **AT LOAD POINT – DISMOUNTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The ZTWTM function cannot be performed because the tape on the specified device is at load point.

**System Action:** None.

**User Response:** If the ZTWTM command was entered because the TPF system was unable to write trailer label information on the tape, you should ensure that possible users of the tape are notified.

The tape will have been unloaded from the device and may be removed you.

See *TPF Operations* for more information about the ZTWTM command.

---

**COTO0115I** *zzzz nnnn* **DEVICE** *cuu* **TAPEMARK DETECTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A ZDEBE command was entered requesting either a forward space, backward space, or read operation but the request was ended because a tapemark was detected.

**System Action:** The tape is positioned after the tapemark (or before the tapemark if the operation was a backward space).

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTO0116E** *zzzz nnnn* **DEVICE** *cuu* **I/O ERROR — OPERATION ABORTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** A ZDEBE command was entered requesting either a forward space, backward space, or read operation but an input/output (I/O) error was found.

**System Action:** The tape is positioned after the record that received the I/O error (or before the record if the operation was a backward space).

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTO0288E DEBE *nnnn* VSN *vvvvvv* IS NOT VALID FOR OUTPUT**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** An operation requiring the volume serial number (VSN) tried to use the tape for output but the CORU user exit prevented it.

**System Action:** The function that required the tape was not performed.

**User Response:** Choose a volume that is authorized for output usage.

---

**COTP0001I DEBE —TAPE LABEL RECORD DISPLAY**

**Explanation:** This is a normal response to the ZDEBE command with the tape label display option.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTP0012E *zzzz nnnn* INVALID FORMAT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COTI0012E message.

**System Action:** See the system action for the COTI0012E message.

**User Response:** See the user response for the COTI0012E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTP0016E *zzzz nnnn* DEVICE *cuu* — TAPE UNREADABLE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COTI0016E message.

**System Action:** See the system action for the COTI0016E message.

**User Response:** See the user response for the COTI0016E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTP0026E *zzzz nnnn* — DEVICE *cuu* TAPE *yyy* — NO HDR1 LABEL**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*yyy* The symbolic tape name.

**Explanation:** See the explanation for the COTN0026E message.

**System Action:** See the system action for the COTN0026E message.

**User Response:** See the user response for the COTN0026E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTP0034E *zzzz nnnn* TAPE *yyy* IS UNLABELED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** See the explanation for the COTN0034E message.

**System Action:** See the system action for the COTN0034E message.

**User Response:** See the user response for the COTN0034E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTP0044I** *zzzz nnnn* **COMPLETE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COTH0044I message.

**System Action:** See the system action for the COTH0044I message.

**User Response:** See the user response for the COTH0044I message.

See *TPF Operations* for more information about the tape support commands.

---

**COTP0115I** *zzzz nnnn* **DEVICE** *cuu* **TAPEMARK DETECTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COTO0115I message.

**System Action:** See the system action for the COTO0115I message.

**User Response:** See the user response for the COTO0115I message.

See *TPF Operations* for more information about the tape support commands.

---

**COTP0117E** *zzzz nnnn* **SYSTEM CYCLING TO 1052 STATE OR GFS NOT ACTIVE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The TPF system issues this message when you enter a command requiring a GFS (pool) function while:

- GFS is not active
- The TPF system is cycling to 1052 state.

In either case, the pool activity is not allowed.

**System Action:** None.

**User Response:** Do the following:

1. Wait for the TPF system cycle down to complete, if necessary.
2. Cycle up the TPF system to or past CRAS state and enter the command again.

See *TPF Operations* for more information about the tape support commands.

---

**COTQ0001I DEBE —TAPE DATA RECORD DISPLAY**

**Explanation:** This is a normal response to the ZDEBE command with the tape record print/display option.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDEBE command.

---

**COTR0000E** *zzzz nnnn* **DEVICE** *cuu* **IN USE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COSI0000E message.

**System Action:** See the system action for the COSI0000E message.

**User Response:** See the user response for the COSI0000E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTR0001E** *zzzz nnnn* **DEVICE** *cuu* **NOT READY**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COTI0001E message.

**System Action:** See the system action for the COTI0001E message.

**User Response:** See the user response for the COTI0001E message.

See *TPF Operations* for more information about the tape support commands.

**Explanation:** See the explanation for the COTF0110E message.

**System Action:** See the system action for the COTF0110E message.

**User Response:** See the user response for the COTF0110E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTR0118I** *zzzz nnnn* **TAPE** *yyy* **SWITCHED BACKWARDS FROM** *cuu* **TO** *cuu*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

**Explanation:** A backward tape switch operation was performed as indicated.

**System Action:** This message is followed by the COTR0087A message.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTR0120E** *zzzz nnnn* **TAPE** *yyy* **HDR2 LABEL ERROR**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** See the explanation for the COTM0120E message.

**System Action:** See the system action for the COTM0120E message.

**User Response:** See the user response for the COTM0120E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTR0147E** *zzzz nnnn* **DEVICE** *cuu* **TAPE** *yyy* **NO HDR2 LABEL**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*yyy* The symbolic tape name.

**Explanation:** See the explanation for the COTM0147E message.

**System Action:** See the system action for the COTM0147E message.

**User Response:** See the user response for the COTM0147E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTR0172E** *zzzz nnnn* **DEVICE** *cuu* **NOT CAPABLE OF OPERATING IN COMPACTION MODE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The ZTRMT command was entered to remount a tape that was written in compacted mode, but the device specified does not support compacted mode. The device must have the improved data recording capability (IDRC) feature installed and enabled to use a tape written in compacted mode.

**System Action:** None.

**User Response:** Enter the ZTRMT command again and specify a device that has the IDRC feature installed and enabled.

See *TPF Operations* for more information about the ZTRMT command and other tape support commands.

---

**COTS0030W** *zzzz nnnn* **TAPE** *yyy* **— NO LABEL INFORMATION**

The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** See the explanation for the COTC0030W message.

**System Action:** See the system action for the COTC0030W message.

**User Response:** See the user response for the COTC0030W message.

See *TPF Operations* for more information about the tape support commands.

---

**COTS0031A** *zzzz nnnn* **DEVICE** *cuu* **LABELS NOT WRITTEN OPERATOR ACTION REQUIRED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COTC0031A message.

**System Action:** See the system action for the COTC0031A message.

**User Response:** See the user response for the COTC0031A message.

See *TPF Operations* for more information about the tape support commands.

**COTS0042A** *zzzz nnnn* **REMOVE** *yyy* **FROM DEVICE** *cuu* **VSN** *vvvvvv* **ERROR ATTEMPTING TAPE SWITCH**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* Device address

*vvvvvv*
The volume serial number (VSN).

**Explanation:** During a tape switch, an error was found when an attempt was made to write to the tape being switched to. The tape specified in the message does not contain any data and should not be considered part of the data set.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands.

---

**COTS0068E** *zzzz nnnn* **TAPE NAME** *yyy* **INVALID**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** See the explanation for the COSI0068E message.

**System Action:** See the system action for the COSI0068E message.

**User Response:** See the user response for the COSI0068E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTS0072E** *zzzz nnnn* **TAPE** *yyy* **— NO LABEL INFORMATION**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** See the explanation for the COTJ0072E message.

The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** The control program detected an end-of-volume condition while performing a rewind operation on a multi-volume input tape.

**System Action:** None.

**User Response:** Enter the ZTRMT command to remount the first volume of the file.

See *TPF Operations* for more information about the ZTRMT command.

---

**COTT0091A** *zzzz nnnn* **TAPE** *yyy* **— REMOUNT PREVIOUS VOLUME**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** The control program detected an end-of-volume condition while performing a backspace or read backward operation on a multi-volume input tape.

**System Action:** None.

**User Response:** Enter the ZTRMT command to remount the previous volume of the file.

See *TPF Operations* for more information about the ZTRMT command.

---

**COTT0382I** *zzzz nnnn* **TAPE** *yyy* **SWITCHED FROM** *cuu* **TO** *cuu* **VSN IS NOW** *vvvvvv*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

*cuu* The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** See the explanation for the COTS0382I message.

**System Action:** See the system action for the COTS0382I message.

**User Response:** See the user response for the COTS0382I message.

---

**COTU0012E** *zzzz nnnn* **INVALID FORMAT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSI0012E message.

**System Action:** See the system action for the COSI0012E message.

**User Response:** See the user response for the COSI0012E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTU0038W** *zzzz nnnn* **DEVICE** *cuu* **NOT ADDED ALREADY CONFIGURED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The device specified in this message was not added to the TPF system since it is already in use as a tape drive. This message may occur when the ZTVAR command is used to add a range of drives or paths and some addresses within the range are already in use.

**System Action:** None.

**User Response:** Do the following:

1. Verify the results of the ZTVAR operation (an automatic display of tape status is the response to a successful ZTVAR operation).
2. Take the appropriate action to remedy any differences between the result achieved and that needed.

See *TPF Operations*for more information about the ZTVAR command.

---

**COTU0041W** *zzzz nnnn* **DEVICE** *cuu* **NOT ACTIONED NOT CONFIGURED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The ZTVAR D message specified removal of a device that is not on the TPF system.

**System Action:** Reconfiguration is continued and is followed by a display of tape status.

**User Response:** If the address specified was not correct, enter the ZTVAR command again and specify the correct address. In addition, you may need to add devices that were deleted erroneously.

See *TPF Operations* for more information about the ZTVAR command.

---

**COTU0043W** *zzzz nnnn* **DEVICE** *cuu* **NOT ADDED NO SPACE IN TAPE STATUS TABLE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An attempt to add tape drives to the TPF system failed because there is not enough space available in the tape status table (TSTB) for the requested addresses to be added.

**System Action:** The specified drive is not added to the TPF system. Reconfiguration is continued and is followed by a display of tape status.

**User Response:** Do one of the following:

- If all of the required drives were not added, you should delete the unwanted drives before adding those that are required.

- If there are no unwanted drives, the TPF system was generated with insufficient space in the tape status table (TSTB). Therefore, you should contact your system support personnel for assistance.

See *TPF Operations* for more information about the tape support commands.

---

**COTU0097E** *zzzz nnnn* **ENTRY RESTRICTED TO BASIC SUBSYSTEM**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSI0097E message.

**System Action:** See the system action for the COSI0097E message.

**User Response:** See the user response for the COSI0097E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTU0098W** *zzzz nnnn* **PROT** *xxxx* **ERROR PREVENTS RECONCILIATION**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*xxxx*
The name of the processor resource ownership table.

**Explanation:** See the explanation for the COTB0098W message.

**System Action:** See the system action for the COTB0098W message.

**User Response:** See the user response for the COTB0098W message.

See *TPF Operations* for more information about the tape support commands.

---

**COTU0099W** *zzzz nnnn* **PATH** *cuu* **DELETED, PROT ENTRY NOT AVAILABLE TO THIS PROCESSOR**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The PROT indicates that the device or path in the message is owned by another processor.

**System Action:** None.

**User Response:** Review the result of the request from the display presented and verify that the action is satisfactory.

If the action is not satisfactory, review the ZTVAR request and, if necessary, enter the ZTVAR command again for a specific device rather than a range of devices.

If necessary, release the device from the owning processor and reassign it to this processor by entering the ZTVAR command.

See *TPF Operations* for more information about the ZTVAR command.

---

**COTU0101I** *zzzz nnnn* **PROT ENTRY** *xxxxxxxx* **FOR DEVICE** *cuu* **BY THIS PROCESSOR**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*xxxxxxxx*
The entry in the processor resource ownership table.

*cuu* The device address.

**Explanation:** See the explanation for the COTB0101I message.

**System Action:** See the system action for the COTB0101I message.

**User Response:** See the user response for the COTB0101I message.

---

**COTU0131E** *zzzz nnnn* **TAPE CONTROL UNIT** *cuu* **NOT DEFINED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** One or both of the control unit addresses specified in the ZTVAR command was not defined as a tape control unit during TPF system generation.

**System Action:** No addresses were added or deleted.

**User Response:** Do one of the following:

- If the address is not correct, enter the command again and specify a correct address.
- If the required address is in fact a tape control unit, see your system support personnel for assistance since the tape control unit cross-reference table may need to be generated again.

See *TPF Operations* for more information about the tape support commands.

**COTU0160E** *zzzz nnnn* **ADDRESS** *cuu* **NOT ACTIONED DEVICE IN USE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The ZTVAR D command specified an action on a device currently occupied by a mounted tape or on a device whose entry in the tape status table (TSTB) is seized.

**System Action:** The device specified in this response is left unaffected by the reconfiguration request. Reconfiguration is continued and is followed by a display of tape status. Tape reconfiguration ignores devices that are not available (AVAIL in the tape status display) and whose entry in the TSTB is seized (indicated with an asterisk in the tape status display).

**User Response:** Ensure that the drives to be reconfigured are free before entering the ZTVAR command.

See *TPF Operations* for more information the ZTVAR command.

---

**COTU0201E** *zzzz nnnn* **ZTVAR PROHIBITED TAPE HARDWARE RESTART INCOMPLETE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The ZTVAR command was entered before the tape hardware restart was complete.

**System Action:** None.

**User Response:** Do the following:

1. Wait for one of the following messages:
   - COSA0146A
   - COTB0177I.
2. Enter the ZTVAR command.

See *TPF Operations* for more information about the ZTVAR command.

---

**COTY0097E** *zzzz nnnn* **ENTRY RESTRICTED TO BASIC SUBSYSTEM**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSI0097E message.

**System Action:** See the system action for the COSI0097E message.

**User Response:** See the user response for the COSI0097E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTY0121E** *zzzz nnnn* **DEVICE** *cuu* **NOT SEIZED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The ZTICL command completed. The tape status table (TSTB) item was not in a seized state.

**System Action:** None.

**User Response:** You may restrict the use of the ZTICL command to system support personnel only.

See *TPF Operations* for more information about the ZTICL command.

---

**COTY0122I** *zzzz nnnn* **DEVICE** *cuu* **UNSEIZED – SEIZING PROGRAM –** *xxxx*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*xxxx*
The name of the seizing program segment.

**Explanation:** The ZTICL command completed.

**System Action:** None.

**User Response:** You may restrict the use of the ZTICL command to system support personnel only.

See *TPF Operations* for more information about the ZTICL command.

---

**COTY0123I** *zzzz nnnn* **DEVICE** *cuu* **UNSEIZED AND FREED — SEIZING PROGRAM —** *xxxx*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

*xxxx*
The name of the seizing program segment.

**Explanation:** The ZTICL command just completed.

**System Action:** None.

**User Response:** You may restrict the use of the ZTICL command to system support personnel only.

See *TPF Operations* for more information about the ZTICL command.

---

**COTZ0000E** *zzzz nnnn* **DEVICE** *cuu* **IN USE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COSI0000E message.

**System Action:** See the system action for the COSI0000E message.

**User Response:** See the user response for the COSI0000E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTZ0001E** *zzzz nnnn* **DEVICE** *cuu* **NOT READY**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COTI0001E message.

**System Action:** See the system action for the COTI0001E message.

**User Response:** See the user response for the COTI0001E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTZ0003E** *zzzz nnnn* **OUTPUT DEVICE** *cuu* **IS WRITE PROTECTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COTI0003E message.

**System Action:** See the system action for the COTI0003E message.

**User Response:** See the user response for the COTI0003E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTZ0007E** *zzzz nnnn* **BYPASS OPTION INVALID**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COTI0007E message.

**System Action:** See the system action for the COTI0007E message.

**User Response:** See the user response for the COTI0007E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTZ0013E** *zzzz nnnn* **DEVICE** *cuu* **NOT ADDRESSABLE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COTM0013E message.

**System Action:** See the system action for the COTM0013E message.

**User Response:** See the user response for the COTM0013E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTZ0044I** *zzzz nnnn* **COMPLETE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COTH0044I message.

**System Action:** See the system action for the COTH0044I message.

**User Response:** See the user response for the COTH0044I message.

See *TPF Operations* for more information about the tape support commands.

---

**COTZ0047E** *zzzz nnnn* **DEVICE** *cuu* **AT LOAD POINT — DISMOUNTED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** See the explanation for the COTO0047E message.

**System Action:** See the system action for the COTO0047E message.

**User Response:** See the user response for the COTO0047E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTZ0048E** *zzzz nnnn* **UNABLE TO BACKSPACE DEVICE** *cuu*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The TPF system was unable to reposition the tape on the specified device after successfully writing a tapemark.

**System Action:** None.

**User Response:** Ensure that the possible users of the tape are notified.

See *TPF Operations* for more information about the tape support commands.

---

**COTZ0049E** *zzzz nnnn* **UNABLE TO WRITE TM ON DEVICE** *cuu*

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** The TPF system was unable to write a tapemark on the specified device.

**System Action:** None.

**User Response:** Ensure that the possible users of the tape are notified.

See *TPF Operations* for more information about the tape support commands.

---

**COTZ0097E** *zzzz nnnn* **ENTRY RESTRICTED TO BASIC SUBSYSTEM**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** See the explanation for the COSI0097E message.

**System Action:** See the system action for the COSI0097E message.

**User Response:** See the user response for the COSI0097E message.

See *TPF Operations* for more information about the tape support commands.

---

**COTZ0288E** **TWTM** *nnnn* **VSN** *vvvvvv* **IS NOT VALID FOR OUTPUT**

**Where:**

*nnnn*
The subsystem user (SSU) name.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The operation that requires the volume serial number (VSN) tried to use the tape for output but the CORU user exit prevented it.

**System Action:** The function that requires the tape was not performed.

**User Response:** Choose a volume that is authorized for output usage.

---

**COT20205E** *zzzz nnnn* **ERROR IN TAPE RESTART — STATE CHANGE DISABLED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** An error was found in tape restart that prevents restart from continuing. This message is preceded by other messages detailing the specific error that was found.

**System Action:** State change is disabled, which prevents TPF system restart from continuing.

**User Response:** Review the preceding errors to determine the appropriate corrective action. These errors must be corrected

before the TPF system can be restarted successfully.

---

**COT20383A** *zzzz nnnn* **DTDAT RECORDS HAVE NOT BEEN MIGRATED OR CLEARED ISSUE A ZTDEV COMMAND WITH THE MIGRATE OR CLEAR PARAMETER**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The defined tape device assignment table (DTDAT) records are not valid and the TPF system cannot determine if the DTDAT records should be migrated or cleared.

**System Action:** Tape restart is suspended.

**User Response:** Do one of the following:

- Enter the ZTDEV command with the MIGRATE parameter specified to migrate the DTDAT records from the #TDATR fixed file record type to the #TDTDR fixed file record type. After the DTDAT records have been migrated, they will be verified automatically by tape restart.
- Enter the ZTDEV command with the CLEAR parameter specified to clear the DTDAT records in the #TDTDR fixed file record type. After the DTDAT records have been cleared, they will automatically be initialized by tape restart.

Tape restart continues after the ZTDEV command (with the MIGRATE or CLEAR parameter specified) proccessing is completed successfully.

See *TPF Operations* for more information about the ZTDEV command.

---

**COT20384I** *zzzz nnnn* **TGDT RECORD INITIALIZED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** During tape restart, the TPF system determined that the tape group definition table (TGDT) that was contained in the #IBMMP4 fixed file record type was not valid and initialized it.

**System Action:** The TGDT is initialized.

**User Response:** None.

---

**COT20385I** *zzzz nnnn* **DTDAT RECORDS INITIALIZED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** During tape restart, the TPF system determined that the defined tape device assignment table (DTDAT) that was contained in the #TDTDR fixed file record type was not valid and initialized it.

**System Action:** The DTDAT records are initialized.

**User Response:** None.

---

**COT50001I** **TDEV** *nnnn* **— ENABLE STATUS AT COMPLETION**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** This is the normal response to the ZTDEV command with the ENABLE parameter specified to enable automatic tape mounting.

**System Action:** The status of the attempt to enable automatic tape mounting is displayed for each device.

**User Response:** None.

See *TPF Operations* for more information about the ZTDEV command and for an example of the informational display.

---

**COT50002I** **TDEV** *nnnn* **— DISABLE STATUS AT COMPLETION**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** This is the normal response to the ZTDEV command with the DISABLE parameter specified to disable automatic tape mounting.

**System Action:** The status of the attempt to disable automatic tape mounting is displayed for each device.

**User Response:** None.

See *TPF Operations* for more information about the ZTDEV command and for an example of the informational display.

---

**COT50003I** **TDEV** *nnnn* **— ASSIGN STATUS AT COMPLETION**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** This is the normal response to the ZTDEV command with the ASSIGN parameter specified.

**System Action:** The results of the command request are displayed for each device.

**User Response:** None.

See *TPF Operations* for more information about the ZTDEV

command and for an example of the informational display.

---

**COT50004I TDEV *nnnn* – UNASSIGN STATUS AT COMPLETION**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** This is the normal response to the ZTDEV command with the UNASSIGN parameter specified.

**System Action:** The results of the command request are displayed for each device.

**User Response:** None.

See *TPF Operations* for more information about the ZTDEV command and for an example of the informational display.

---

**COT50005I TDEV *nnnn* — DISPLAY STATUS AT COMPLETION**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** This is the normal response to the ZTDEV command with the DISPLAY parameter specified.

**System Action:** The status of automatic tape mounting and all the group assignments for the device is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZTDEV command and for an example of the informational display.

---

**COT50006I TDEV *nnnn* — RESUME STATUS AT COMPLETION**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** This is the normal response to the ZTDEV command with the RESUME parameter specified to resume automatic tape mounting.

**System Action:** The status of the attempt to resume automatic tape mounting is displayed for each device.

**User Response:** None.

See *TPF Operations* for more information about the ZTDEV command.

---

**COT50007I TDEV *nnnn* — MIGRATE STATUS AT COMPLETION**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** This is the normal response to the ZTDEV command with the MIGRATE parameter specified.

**System Action:** The results of the command request are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZTDEV command and for an example of the informational display.

---

**COT50008I TDEV *nnnn* — CLEAR STATUS AT COMPLETION**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** This is the normal response to the ZTDEV command with the CLEAR parameter specified.

**System Action:** The results of the command request are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZTDEV command and for an example of the informational display.

---

**COT50012E TDEV *nnnn* — INVALID FORMAT**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The ZTDEV command was used with an incorrect message format.

**System Action:** An error message is issued and the ECB is exited.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZTDEV command.

---

**COT70001I TGRP *nnnn* DEFINE — STATUS AT COMPLETION**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** This is the normal response to the ZTGRP command with the DEFINE parameter specified to define one or more tape groups.

**System Action:** The status of the attempt to define each tape group is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZTGRP command and for an example of the informational display.

**COT70002I TGRP *nnnn* DELETE — STATUS AT COMPLETION**

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** This is the normal response to the ZTGRP command with the DELETE parameter specified to delete one or more tape groups.

**System Action:** The status of the attempt to delete each tape group is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZTGRP command and for an example of the informational display.

**COT70003I TGRP *nnnn* DISPLAY — DEFINED GROUPS *gggggggg* ... *gggggggg***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*gggggggg*
The group name.

**Explanation:** This is the normal response to the ZTGRP command with the DISPLAY parameter specified.

**System Action:** Information about all the tape groups that are currently defined is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZTGRP command.

**COT70004I TGRP *nnnn* DISPLAY — LABELS ASSIGNED TO GROUP *gggggggg***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*gggggggg*
The group name.

**Explanation:** This is the normal response to the ZTGRP command with the DISPLAY and LABELS parameters specified.

**System Action:** A list of all the tape labels defined for the specified tape group in the current subsystem user (SSU) is displayed. If the SSU ALL parameter was specified, the tape labels defined for the specified tape group in any SSU are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZTGRP command.

**COT70005I TGRP *nnnn* DISPLAY — DEVICES ASSIGNED TO GROUP *gggggggg***

**Where:**

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*gggggggg*
The group name.

**Explanation:** This is the normal response to the ZTGRP command with the DISPLAY and DEVICES parameters specified.

**System Action:** A list of all the tape devices defined for the specified tape group in the current subsystem user (SSU) is displayed. If the SSU ALL parameter was specified, the tape devices defined for the specified tape group in any SSU are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZTGRP command and for an example of the informational display.

**COT70010E TGRP INVALID REQUEST FORMAT**

**Explanation:** The ZTGRP command was entered with an incorrect message format.

**System Action:** An error message is issued and the ECB is exited.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZTGRP command.

**COT70015E MESSAGE RESTRICTED TO THE BSS SUB-SYSTEM**

**Explanation:** This command must be entered from the basic subsystem (BSS).

**System Action:** An error message is issued and the ECB is exited.

**User Response:** Enter the command again from the BSS.

See *TPF Operations* for more information about the ZTGRP command.

**COT70016E TAPE RESTART IS NOT COMPLETE**

**Explanation:** This command was entered before tape restart completed.

**System Action:** An error message is issued and the ECB is exited.

**User Response:** Enter the command again after the tape restart is completed.

See *TPF Operations* for more information about the ZTGRP command.

**COT70017E BYPASS NOT PERMITTED**

**Explanation:** An attempt was made to delete a group definition with the BP option and all subsystem users (SSUs) are active.

**System Action:** An error message is issued and the ECB is exited.

**User Response:** Enter the command again without the BP option.

See *TPF Operations* for more information about the ZTGRP command.

**COT70018E ALL SSUs ARE NOT ACTIVE, BYPASS REQUIRED**

**Explanation:** An attempt was made to delete a group definition without all subsystem users (SSUs) being active.

**System Action:** An error message is issued and the ECB is exited.

**User Response:** Do one of the following:

- Activate all SSUs and then enter the command again
- Enter the command again with the BP option.

See *TPF Operations* for more information about the ZTGRP command.

**COT90093W** *zzzz nnnn* **TLMR ALLOCATION INSUFFICIENT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** The number of tape label directory (TPLD) records and tape label mask records (TLMRs) in the #TPLBL fixed file record type is defined in the TAPEQ macro as the CS9NTD and CS9NTM equates. As shipped, the TPF system has 2 TPLD records and 16 TLMR records.

**System Action:** One of the following occurs:

- If the TPF system is initializing TLMR records in the #TPLBL fixed file record type when this message is issued and the number of TLMR records is fewer than required, the associated TPLD entries are initialized to zero.
- If the TPF system is migrating TLMR records from the #TLDMR fixed file record type to the #TPLBL fixed file record type when this message is issued, as many TLMR records are migrated as possible. For all TLMR records that cannot be migrated, the corresponding TPLD entries are initialized to zero, possibly resulting in lost TLMR records.

**User Response:** This message means that the TAPEQ values were changed without a corresponding change to the fixed file record allocation or that the fixed file record allocation is not correct. Have your system programmer verify that the records were initialized or migrated correctly.

**COT90386I** *zzzz nnnn* **TGDT RECORD MIGRATED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** During tape restart, the TPF system determined that the tape group definition table (TGDT) that was contained in the #IBMMP4 fixed file record type was not valid and migrated it.

**System Action:** The TGDT record in the #IBMM4 fixed file record type is migrated to the #IBMMP4 fixed file record type.

**User Response:** None.

**COT90387I** *zzzz nnnn* **DTDAT RECORDS MIGRATED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** During tape restart, the TPF system determined that the defined tape group device assignment table (DTDAT) that was contained in the #TDTDR fixed file record type was not valid and migrated it.

**System Action:** The DTDAT records in the #TDATR fixed file record type are migrated to the #TDTDR fixed file record type.

**User Response:** None.

**COT90388W** *zzzz nnnn* **DTDAT DATA RECORD ALLOCATION INSUFFICIENT**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** There were not enough #TDTDR ordinals available for the TPF system to migrate the defined tape device assignment table (DTDAT) records from the #TDATR fixed file record type to the #TDTDR fixed file record type.

**System Action:** The TPF system migrates as many DTDAT data records from the #TDATR fixed file record type to the #TDTDR fixed file record type as possible.

**Note:** This can result in lost DTDAT data records.

**User Response:** This message means that the #TDTDR fixed file record allocation is not consistent with the #TDATR fixed file record allocation and the number of defined tape devices. Have your system programmer verify that the DTDAT records were migrated correctly.

**COT90389I** *zzzz nnnn* **TPLD AND TLMR RECORDS MIGRATED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** During tape restart, the TPF system determined that one or more of the tape label directory (TPLD) records or the tape label mask (TLMR) records that were contained in the #TPLBL fixed file record type were not valid and migrated all of the TPLD and TLMR records.

**System Action:** The TPLD and TLMR records are migrated from the #TLDMR fixed file record type to the #TPLBL fixed file record type.

**User Response:** None.

**COT90390I** *zzzz nnnn* **TPLD AND TLMR RECORDS INITIALIZED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

**Explanation:** During tape restart, the TPF system determined that one or more of the tape label directory (TPLD) records or the tape label mask records (TLMRs) that were contained in the #TPLBL fixed file record type were not valid and initialized all of the TPLD and TLMR records.

**System Action:** The TPLD and TLMR records are initialized.

**User Response:** None.

# COUH–CPSF

**COUH0015I CODR POLICING OK**

**Explanation:** The time-activated policing of the unsolicited message queue completed processing.

**System Action:** Terminals are notified of pending unsolicited messages and old messages are purged from the unsolicited message queue.

**User Response:** None.

**COUT0001E**

**Explanation:** See the CSIO line error messages for any message with a COUT header.

**System Action:** None.

**User Response:** None.

**CPAA0002E SDA** *addr* **IN USE, OTHER SUBSYSTEM OR MODULE TYPE**

**Where:**

*addr*
The symbolic device address (SDA).

**Explanation:** You tried to mount a device that was already in use by another subsystem or as another module type (for example, trying to mount a general file on a real-time module).

**System Action:** The mount request is refused with a device in other use return code.

**User Response:** This is a diagnostic message for an error that was found during mount processing on behalf of a higher-level function such as ZAVSN, ZDVSN, and ZFMNT. Respond as indicated for any error messages that are issued by that higher-level function.

**CPAA0003E SDA** *addr* **IN USE, NOT OFFLINE**

**Where:**

*addr*
The symbolic device address (SDA).

**Explanation:** You tried to mount a device that was already in use. The mount was attempted for a purpose that required the device to be offline.

**System Action:** The mount request is refused with a device in use, not offline, return code.

**User Response:** This is a diagnostic message for an error that was found during mount processing on behalf of a higher-level function such as ZAVSN, ZDVSN, and ZFMNT. Respond as indicated for any error messages that are issued by that higher-level function.

**CPAA0004E SDA** *addr* **NOT MOUNTED, READ LOCK I/O FAILED**

**Where:**

*addr*
The symbolic device address (SDA).

**Explanation:** You tried to mount a device but the read lock input/output (I/O) for the device failed.

**System Action:** The mount request is refused with a read lock I/O failed return code.

**User Response:** This is a diagnostic message for an error that was found during mount processing on behalf of a higher-level function such as ZAVSN, ZDVSN, and ZFMNT. Respond as indicated for any error messages that are issued by that higher-level function.

**CPAA0005E SDA** *addr* **NOT MOUNTED, UNLOCK I/O FAILED**

**Where:**

*addr*
The symbolic device address (SDA).

**Explanation:** You tried to mount a device but the unlock input/output (I/O) for the device failed.

**System Action:** The mount request is refused with an unlock I/O failed return code.

**User Response:** This is a diagnostic message for an error that was found during mount processing on behalf of a higher-level function such as ZAVSN, ZDVSN, and ZFMNT. Respond as indicated for any error messages that are issued by that higher-level function.

---

**CPAA0006E SDA *addr* NOT MOUNTED, INVALID PATHID FOR C/U**

**Where:**

*addr*
The symbolic device address (SDA).

**Explanation:** You tried to mount a device but the path ID for the control unit (CU) was not valid.

**System Action:** The mount request is refused with a path ID return code that is not valid.

**User Response:** This is a diagnostic message for an error that was found during mount processing on behalf of a higher-level function such as ZAVSN, ZDVSN, and ZFMNT. Respond as indicated for any error messages that are issued by that higher-level function.

---

**CPAA0007E SDA *addr* NOT MOUNTED, UNABLE TO ACCESS SDA**

**Where:**

*addr*
The symbolic device address (SDA).

**Explanation:** You tried to mount a device by the TPF system was unable to access the SDA.

**System Action:** The mount request is refused with an unable to access return code.

**User Response:** This is a diagnostic message for an error that was found during mount processing on behalf of a higher-level function such as ZAVSN, ZDVSN, and ZFMNT. Respond as indicated for any error messages that are issued by that higher-level function.

---

**CPAA0009E SDA *addr* NOT MOUNTED, UNDEFINED SDA**

**Where:**

*addr*
The symbolic device address (SDA).

**Explanation:** You tried to mount a device, but the requested symbolic device address was not defined to the TPF system. This condition was detected by common input/output (CIO) services that issued an error return code indicating that the device was not in the CIO tables.

**System Action:** The mount request is refused with an undefined SDA return code.

**User Response:** This is a diagnostic message for an error that was found while mounting a device on behalf of a higher-level function such as ZAVSN, ZDVSN, and ZFMNT. Respond as indicated for any error messages that are issued by that higher-level function.

---

**CPAA0010E SDA *addr* NOT MOUNTED, DEVICE UNUSABLE**

**Where:**

*addr*
The symbolic device address (SDA).

**Explanation:** You tried to mount a device but the requested device was unusable because an attempt to initialize an record cache subsystem (RCS) control unit (CU) failed.

**System Action:** The mount request is refused with a device usable return code.

**User Response:** This is a diagnostic message for an error that was found during mount processing on behalf of a higher-level function such as ZAVSN, ZDVSN, and ZFMNT. Respond as indicated for any error messages that are issued by that higher-level function.

---

**CPAA0011E SDA *addr* NOT MOUNTED, NO ENTRIES AVAILABLE**

**Where:**

*addr*
The symbolic device address (SDA).

**Explanation:** You tried to mount a device but there were no more MFST entries available. The maximum number of data sets were already mounted on the TPF system.

**System Action:** The mount request is refused with a no entries available return code.

**User Response:** This is a diagnostic message for an error that was found during mount processing on behalf of a higher-level function such as ZAVSN, ZDVSN, and ZFMNT. Respond as indicated for any error messages that are issued by that higher-level function.

---

**CPAA0012E SDA *sda* NOT MOUNTED, VFA SYNC ACTIVE**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** You tried to mount a device that exists on a control unit that is not supported when virtual file access (VFA) synchronization is active.

**System Action:** The mount request has not completed successfully.

**User Response:** This is a diagnostic error message for an error that occurred while processing the ZAVSN, ZDVSN, or ZMCPY commands. Respond as indicated for any error messages issued by those commands.

See *TPF Operations* for more information about the ZAVSN, ZDVSN, and ZMCPY commands.

---

**CPAA0013E SDA *sda* NOT MOUNTED, UNABLE TO DETERMINE CF INDEX**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** While mounting a general data set (GDS) that

uses coupling facility (CF) record lock support, the TPF system issued a LEMIC macro to determine the index of the CF to use. The LEMIC macro returned an error.

**System Action:** The module is taken offline.

**User Response:** See *TPF System Macros* for more information about the LEMIC macro and how to correct this error.

---

**CPAA0098E SDA *addr* NOT MOUNTED, INVALID DEVICE ADDRESS**

**Where:**

*addr*
The symbolic device address (SDA).

**Explanation:** You tried to mount a device but the requested symbolic device address (SDA) was not valid. Either the device was not found in CTK0 or the TPF system was unable to read CTK0.

**System Action:** The mount request is refused with a device address return code that is not valid.

**User Response:** This is a diagnostic message for an error that was found during mount processing on behalf of a higher-level function such as ZAVSN, ZDVSN, and ZFMNT. Respond as indicated for any error messages that are issued by that higher-level function.

---

**CPAA0099E INVALID CPAA RETURN CODE OF *xxxxxxxx***

**Where:**

*xxxxxxxx*
The return code.

**Explanation:** You tried to mount a device but the error return code generated during CPAA mount processing was greater than the maximum documented return code for CPAA.

**System Action:** The mount request is refused but the return code passed to the caller is unexpected.

**User Response:** This diagnostic message normally indicates that a logic error occurred. See your system programmer for more information.

---

**CPAG0050E ERROR IN SET PATH GROUP ID CHPID *id* NO LONGER AVAILABLE FOR *sda***

**Where:**

*id* The channel path ID (CHPID).

*sda* The symbolic device address (SDA).

**Explanation:** An unrecoverable error occurred during Set Path Group ID processing.

**System Action:** The CHPID is deleted from the Path Available Mask field (MF1PAM) in the module file status table (MFST) for the SDA specified in the message.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY and ZPATH commands.

---

**CPAH0050W VSN DISCREPANCY ON THE FOLLOWING CHPIDS FOR *sda* CHPID *id1* – VSN *volser1* CHPID *id2* – VSN *volser2***

**Where:**

*sda* The symbolic device address (SDA).

*id1* The first channel path ID (CHPID).

*volser1*
The volume serial number (VSN).

*id2* The second CHPID.

*volser2*
The volume serial number (VSN).

**Explanation:** The TPF system issues this message when two different volume serial numbers (VSN) are read from two paths that the subchannel information block (SCHIB) indicates are connected to the same DASD.

**System Action:** The first CHPID is deleted from the Path Available Mask field (MF1PAM) in the module file status table (MFST) for the SDA.

**User Response:** Reading two different VSNs from different channel paths suggests an error in cabling or switching. You may need to perform a new IOCP generation.

If a new IOCP generation is not necessary, enter the ZPATH command to bring the path back online.

See *TPF Operations* for more information about the ZMCPY and ZPATH commands.

---

**CPAH0051E UNABLE TO READ VSN FOR *sda* on CHPID *id***

**Where:**

*sda* The symbolic device address (SDA).

*id* The channel path ID (CHPID).

**Explanation:** This message occurs when there is an unrecoverable input/output (I/O) error while trying to read the volume serial number (VSN) from the SDA specified in the message.

**System Action:** The CHPID is deleted from the path available mask field (MF1PAM) in the module file status table (MFST) for the SDA specified in the message.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY and ZPATH commands.

---

**CPAI0048W NO DASD CONFIGURED ON RCS SSID *ssss* — SUBSYSTEM HAS BEEN REMOVED FROM THE COMPLEX**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** No modules were found in the module file status table (MFST) to be attached to the record cache subsystem specified in the message.

**System Action:** The subsystem status table (SSST) entry for the specified subsystem is deleted.

**User Response:** None.

---

**CPA00001I PERFORMANCE ANALYZER: NO HOOK DATA, NO TRACE FILE CREATED**

**Explanation:** The TPF Performance Execution Trace Analyzer for VisualAge Client detected no trace hooks in the programs that you are analyzing.

**System Action:** The TPF Performance Execution Trace Analyzer for VisualAge Client ends; a trace file is not created. The entry control block (ECB) continues.

**User Response:** Compile the programs with trace hooks. See the VisualAge online help panels for more information about compiling with trace hooks.

---

**CPA00002E PERFORMANCE ANALYZER: ICONV CODE PAGE TRANSLATION ERROR**

**Explanation:** An error occurred when calling the code page translation while you were running the TPF Performance Execution Trace Analyzer for VisualAge Client.

**System Action:** The TPF Performance Execution Trace Analyzer for VisualAge Client ends; a trace file is not created. The entry control block (ECB) continues.

**User Response:** See your IBM service representative.

---

**CPA00003E CPA0: ERROR CALLING *function* IN *segment area*, REASON: *code***

**Where:**

*function*
The name of the C/C++ function where the error occurred.

*segment*
The object in the CPA0 module where the error occurred.

*area*
The location identifier in the segment; for example, this can be a C/C++ function name or a switch case.

*code*
The error that is returned by the failing C/C++ function.

**Explanation:** The failing C/C++ function returned an error while you were running the TPF Performance Execution Trace Analyzer for VisualAge Client.

**System Action:** The TPF Performance Execution Trace Analyzer for VisualAge Client ends; a trace file is not created. The entry control block (ECB) continues.

**User Response:** Do the following:

1. Verify your file system permissions; the TPF Performance Execution Trace Analyzer for VisualAge Client requires write access to the root of the file system.
2. Enter the ZFILE chmod command and set the permission to 777 / to get write access to the file system root if you do not already have write access.

---

**CPA00004I PERFORMANCE ANALYZER: TRACE FILE *filename* HAS BEEN CREATED**

**Where:**

*filename*
The name of the trace file that you defined in the TPF Performance Execution Trace Analyzer for VisualAge Client registration window.

**Explanation:** The TPF Performance Execution Trace Analyzer for VisualAge Client created a trace file with the specified name.

**System Action:** The TPF Performance Execution Trace Analyzer for VisualAge Client ends.

**User Response:** None.

---

**CPSE0003T PROGRAM ERROR IN CCCPSE**

**Explanation:** A program check occurred during system error processing. Error recovery will be initiated. This message is followed by a display of the program old PSW and general register contents at the time of the error.

**System Action:** Control is passed to irrecoverable error recovery processing to initiate a software IPL. Cycle down processing is bypassed.

**User Response:** See your IBM service representative.

---

**CPSE0004W TAPE *yyy* NOT MOUNTED, SYSTEM ERROR DUMP BYPASSED**

**Where:**

*yyy* The symbolic tape name.

**Explanation:** This message is displayed when system error dumps are directed to tape and the dump tape is not mounted.

**System Action:** Dump processing is ended.

**User Response:** Mount a dump tape with the label specified in the message.

See *TPF Main Supervisor Reference* for more information.

---

**CPSE0005W DUMP TAPE SOFTWARE STATUS QUESTIONABLE — SYSTEM ERROR DUMP BYPASSED**

**Explanation:** This message is displayed when system error dumps are directed to tape and the primary indicators in the tape status table entry for the dump tape show that the tape is not available for use.

**System Action:** Dump processing is ended.

**User Response:** Do the following:

1. Determine the reason for the questionable status.
2. Correct the error.

See *TPF Main Supervisor Reference* for more information.

---

**CPSE0006W DUMP DEVICE *cuu* UNAVAILABLE, CODE *c***

**Where:**

*cuu* The device address.

*c* The reason code.

**Explanation:** This message is displayed when the system error dump device specified in the message is not available.

The code specified in the message can be a value from 1 to 7. A description of the reason codes follows here:

| Reason Code | Description |
|---|---|
| **1** | A PIOFC was attempted before a SPNDC was issued and the PIOFC returned condition code 1. |
| **2** | A PIOFC request is already active for the dump device and the PIOFC returned condition code 2. |
| **3** | The dump device is not accessible and the PIOFC returned condition code 3. |
| **4** | The retry counter was exhausted while trying to write to the dump device. |
| **5** | The primary indicator byte of the tape status table shows that the tape is in questionable status. The PIOFC is not issued. |
| **6** | A permanent error was found while trying to write to the dump device. |
| **7** | The real-time printer is not available. |

**System Action:** Dump processing is ended.

**User Response:** See your IBM service representative.

See *TPF Main Supervisor Reference* for more information.

---

**CPSE0007W DUMP TAPE SWITCH IN PROGRESS — SYSTEM ERROR DUMP BYPASSED**

**Explanation:** A condition detected on the dump tape caused the dump tape to switch. However, a dump was initiated before the switch could complete.

**System Action:** No dump is taken and dump processing is suppressed.

**User Response:** Allow the dump tape switch to complete. No action is required.

See *TPF Main Supervisor Reference* for more information.

---

**CPSE0008E WRITE ERROR ON DUMP DEVICE *cuu* DUMP SEQUENCE NUMBER *ssss* ABORTED**

**Where:**

*cuu* The device address.

*ssss* The sequence number.

**Explanation:** This message is displayed when an irrecoverable error occurs on the system error dump device.

**System Action:** The dump is lost and dump processing is ended.

**User Response:** Correct the error condition on the dump device.

See *TPF Main Supervisor Reference* for more information.

---

**CPSE0009E DUMP SEQUENCE NUMBER *ssss* ABORTED, REASON CODE *c***

**Where:**

*ssss* The sequence number.

*c* The reason code.

**Explanation:** This message is displayed when the writing of a dump to the dump tape must be aborted. The reason code can be a value from 1 to 5. A description of the reason codes follows here:

| Reason Code | Description |
|---|---|
| **1** | An end-of-volume was found on the dump tape and the tape cannot be switched because the tape switch was already in progress for the tape before the system error occurred. |
| **2** | The dump device is unavailable. The CPSE0006W message was already issued. |
| **3** | A permanent error was found on the dump tape. The dump is aborted and no attempt is made to switch the tape. |
| **4** | A dump cannot be started because DDR recovery was in progress for the tape before the system error occurred. No attempt is made to switch the tape. |
| **5** | An end-of-volume was found on the dump tape and there is no tape available to switch to. Control is passed to the ECB-controlled tape switch routines. |

**System Action:** Dump processing is ended.

**User Response:** For reason codes 2 and 3, take appropriate steps to ensure that a dump tape is mounted and available. No other response is required.

See *TPF Main Supervisor Reference* for more information.

---

**CPSE0010W TAPE DEVICE *cuu* UNAVAILABLE FOR SWITCH**

**Where:**

*cuu* The device address.

**Explanation:** An attempt was made to switch the dump tape to the device specified in the message but an input/output (I/O) error was found while trying to ready the new tape.

**System Action:** Dump processing is continued. An attempt is made to find another tape suitable for use as the dump tape.

**User Response:** Do the following:

1. Determine the cause of the I/O error when dump processing is completed.
2. Correct the error.

See *TPF Main Supervisor Reference* for more information.

---

**CPSE0011I** *syserr* **DUMP IN PROGRESS, LOCATION** *xxxxxxxx*

**Where:**

*syserr*
The system error.

*xxxxxxxx*
The virtual storage address of the area currently being dumped.

**Explanation:** This status message is generated when the writing of a dump to the dump device has taken longer than 5 seconds. The message is repeated every 5 seconds until dump processing is completed. The location specified in the message is the virtual storage address of the area currently being dumped.

**System Action:** Dump processing is continued.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**CPSE0012I** **TAPE** *yyy* **SWITCHED FROM** *cuu* **TO** *cuu*

**Where:**

*yyy* The symbolic tape name.

*cuu* The device address.

**Explanation:** This message is generated when dump tape switch is completed successfully. The writing of the dump continues on the new tape volume.

**System Action:** Dump processing is continued.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**CPSE0013E** **REMOVE** *yyy* **TAPE FROM DEVICE** *cuu* **ERROR ATTEMPTING TAPE SWITCH**

**Where:**

*yyy* The symbolic tape name.

*cuu* The device address.

**Explanation:** An attempt to switch to a standby or alternate (ALT) tape failed.

**System Action:** The control program removed the tape from the tape status table and unloaded the volume from the device.

**User Response:** The device that is specified in the message experienced an error. Check that device.

See the COTS0042A message for more information.

---

**CPSE0014I** **TAPE** *yyy* **MOUNTED ON DEVICE** *cuu* **VSN** *vvvvvv*

**Where:**

*yyy* The symbolic tape name.

*cuu* The device address.

*vvvvv*
The volume serial number.

**Explanation:** The tape name specified in the message was mounted on the device specified in the message.

**System Action:** None.

**User Response:** None.

See the COTM0046I message for more information.

---

**CPSE0015I** **IS–***is* **SS—***ssn* **SSU–***ssun* **SE—***seqnum* **MANAUL DUMP** *lniatac prog*

**Where:**

*is* The I-stream (displayed as a decimal number) where the manual dump was issued.

*ssn* The four-character subsystem name.

*ssun*
The four-character subsystem user (SSU) name.

*seqnum*
The four-character dump sequence number.

*lniatac*
The line number, interchange address, and terminal address (LNIATA) and the CPU ID of the terminal associated with the ECB finding the error.

*prog*
The real-time program finding the error.

**Explanation:** This message is the response to the ZDUMP command.

**System Action:** None.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**CPSE0016A** **DEVICE** *cuu* **ACL INTERVENTION REQUIRED**

**Where:**

*cuu* The device address.

**Explanation:** The Automatic Cartridge Loader on the device specified in the message requires your intervention. One of the following errors occurred:

- There are no more cartridges in the input stack.
- The output areas of the ACL are full.

**System Action:** None.

**User Response:** Correct the error if the device is to use the Automatic Cartridge Loader.

See the COSK01709 message for more information.

---

**CPSE0017E** **VSN** *vvvvvv* **ON DEVICE** *cuu* **FILE ACTIVE UNTIL** *date*

**Where:**

*vvvvvv*
The volume serial number.

*cuu* The device address.

*date*
The Julian date.

**Explanation:** A volume that contains an unexpired file was loaded in a device that is enabled for automatic tape mounting.

**System Action:** The volume is unloaded from the device.

**User Response:** Load a volume with an expired file in the device.

See the COTI0006E message for more information.

---

**CPSE0018E TAPE ON DEVICE *cuu* HAS NO VSN, INITIALIZE TAPE**

**Where:**

*cuu* The device address.

**Explanation:** A volume that does not have a valid VOL1 record on it was loaded into a device that is enabled for automatic tape mounting.

**System Action:** The volume is unloaded from the device.

**User Response:** After system error processing is completed, initialize the tape.

See the COTM0005E message for more information.

---

**CPSE0019E DEVICE *cuu* UNSUPPORTED MESSAGE FORMAT *xxxxxxxx***

**Where:**

*cuu* The device address.

*xxxxxxxx*
The first four bytes of data that the control unit sent to the TPF system, including an indicator of the message format.

**Explanation:** The subsystem sent an unsupported message to the TPF system.

**System Action:** The TPF system notifies the subsystem that it does not support the requested function.

**User Response:** Using the information provided in the message, determine the nature of the request and why an attempt was made to request that function.

See the COSK0195I message for more information.

---

**CPSE0020E TAPE ON DEVICE *cuu* ERROR READING HDR LABELS**

**Where:**

*cuu* The device address.

**Explanation:** An error was found during an attempt to read and validate the VOL1 and HDR1 labels on the indicated volume.

**System Action:** The volume is unloaded from the device.

**User Response:** After system error processing is complete, initialize the volume.

See the COSK0016E message for more information.

---

**CPSE0021A DEVICE *cuu* NOT READY**

**Where:**

*cuu* The device address.

**Explanation:** After an interrupt indicating that the device enabled for automatic tape mounting, had changed status from not ready to ready, the TPF system detected that the device was not ready.

**System Action:** The volume remains loaded in the device.

**User Response:** Do one of the following:

- Make the drive ready again.
- Manually unload the volume from the drive and replace it with another volume.

See the COTI0001E message for more information.

---

**CPSE0022I DEVICE *cuu* TAPE AWAY FROM LOAD POINT**

**Where:**

*cuu* The device address.

**Explanation:** After an attention interrupt indicating that the device enabled for automatic tape mounting had changed status from not ready to ready, the TPF system detected that the volume was not at load point.

**System Action:** The volume remains loaded in the device.

**User Response:** Do one of the following:

- Rewind the volume and make the device ready again.
- Unload the volume from the device and replace it with another volume.

See the COSK0200I message for more information.

---

**CPSE0023I DEVICE *cuu* TAPE WRITE PROTECTED**

**Where:**

*cuu* The device address.

**Explanation:** After an interrupt indicating that the device enabled for automatic tape mounting had changed status from not ready to ready, the TPF system detected that the volume was write-protected.

**System Action:** The volume is unloaded from the device.

**User Response:** Determine why a write-protected volume was loaded into a device that was enabled for automatic tape mounting.

See the COSK0003I message for more information.

---

**CPSE0024A DEVICE *cuu* ERROR WRITING TRAILER LABELS**

**Where:**

*cuu* The device address.

**Explanation:** After a tape switch, the attempt to write trailer labels on the former active tape failed.

**System Action:** The volume remains loaded in the device

and positioned at the point of failure.

**User Response:** Do the following:

1. Wait for system error processing to complete.
2. Enter the ZTWTM command to write tapemarks on the tape to mark the end of the data on the tape
3. See the COTC0031A message for more information..

See *TPF Operations* for more information about the ZTWTM command.

---

**CPSE0025I** **DEVICE** *cuu* **FORMAT INCOMPATIBLE, 3480 XF**

**Where:**

*cuu* The device address.

**Explanation:** A volume that was previously recorded in 3480 or 3480 XF format was loaded in a device that is not capable of writing 3480 format.

**System Action:** The volume is unloaded from the device.

**User Response:** Do one of the following:

- Initialize the volume on a device that is capable of writing 3480 XF format.
- Move the volume to a device that is capable of writing 3480 format.

See the COSK0182E message for more information.

---

**CPSE0026A** **REMOVE** *yyy* **TAPE FROM DEVICE** *cuu*

**Where:**

*yyy* The symbolic tape name.

*cuu* The device address.

**Explanation:** A tape switch completed.

**System Action:** The volume is unloaded from the device.

**User Response:** Do the following:

1. Remove the tape from the device.
2. Affix a suitable external label.

See the COTC0080A message.

---

**CPSE0027E** **VSN** *vvvvvv* **IS NOT VALID FOR OUTPUT**

**Where:**

*vvvvvv*
The volume serial number (VSN).

**Explanation:** The volume serial number (VSN) referenced in the message was loaded onto a tape device that had automount enabled, but the VTO CP user exit indicated that the tape was not valid for output.

**System Action:** The tape is unloaded from the drive.

**User Response:** Choose a volume that is authorized for output usage.

---

**CPSE0028E** *zzzz nnnn* **DEVICE** *cuu* **REQUIRED SUBSYSTEM FUNCTION HAS FAILED**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*cuu* The device address.

**Explanation:** An inhibit extended recovery function or enable extended recovery function, which is required by the TPF system, has failed on the device.

**System Action:** The device is removed from the configuration.

**User Response:** Verify that the devices are at the correct licensed internal code (LIC) levels.

See the *TPF Migration Guide: Program Update Tapes* for more information about which levels of code and software programs need to be installed on your devices.

---

**CPSE0050E** **IS—***is* **SS—***ssn* **SSU—***ssun* **SE—***seqnum* **CTL—***perrnum* **[***lniatac prog***] [***appended error message***]**

**Where:**

*is* The I-stream (displayed as a decimal number) where the error occurred.

*ssn* The four character subsystem name.

*ssun*
The four character subsystem user (SSU) name.

*seqnum*
The four character dump sequence number.

*p* The one character prefix.

*errnum*
The six character system error number.

*lniatac*
The line number, interchange address, and terminal address (LNIATA) and the CPU ID of the terminal associated with the ECB finding the error.

*prog*
The real-time program finding the error.

*appended error message*
The error message (such as EOM CODED AND NO EOM IN STRING) is appended.

**Explanation:** This message is displayed on the system console whenever a SERRC macro is issued by the control program or a program interrupt occurs. The system error number and the dump sequence number are displayed as part of the message. Additional data may be appended to this message depending on the SERRC macro options used. This format is displayed if the system error occurs when the error was detected by the control program.

**System Action:** This is dependent upon the prefix and the six character system error number in the message.

**User Response:** Determine the cause of the system error and take the appropriate action to correct the error.

See *Messages (System Error and Offline)* for more information about the system error number. Also see *TPF Main Supervisor Reference* for more information.

---

**CPSE0051T** **IS—***is* **SS—***ssn* **SSU—***ssun* **SE—***seqnum* **CTL—***perrnum* **CATASTROPHIC [***lniatac prog***] [***appended error message***]**

**Where:**

*is* The I-stream (displayed as a decimal number) where the error occurred.

*ssn* The four character subsystem name.

*ssun*
The four character subsystem user (SSU) name.

*seqnum*
The four character dump sequence number.

*p* The one character prefix.

*errnum*
The six character system error number.

*lniatac*
The line number, interchange address, and terminal address (LNIATA) and the CPU ID of the terminal associated with the ECB finding the error.

*prog*
The real-time program finding the error.

*appended error message*
The error message (such as EOM CODED AND NO EOM IN STRING) is appended.

**Explanation:** This message is displayed on the system console whenever a SERRC macro is issued by the control program or a program interrupt occurs. The system error number and the dump sequence number are displayed as part of the message. Additional data may be appended to this message depending on the SERRC macro options used. This format is displayed if the system error occurs when the error was detected by the control program.

**System Action:** If another irrecoverable system error is issued within 5 minutes of the initial error, a software IPL occurs.

**User Response:** Determine the cause of the system error and take the appropriate action to correct the error.

See *Messages (System Error and Offline)* for more information about the system error number. Also see *TPF Main Supervisor Reference* for more information.

---

**CPSE0052E** **IS—***is* **SS—***ssn* **SSU—***ssun* **SE—***seqnum* **OPR—***perrnum lniatac prog* **[***appended error message***]**

**Where:**

*is* The I-stream (displayed as a decimal number) where the error occurred.

*ssn* The four character subsystem name.

*ssun*
The four character subsystem user (SSU) name.

*seqnum*
The four character dump sequence number.

*p* The one character prefix.

*errnum*
The six character system error number.

*lniatac*
The line number, interchange address, and terminal address (LNIATA) and CPU ID of the terminal associated with the ECB finding the error.

*prog*
The real-time program finding the error.

*appended error message*
The error message (such as EOM CODED AND NO EOM IN STRING) is appended.

**Explanation:** This message is displayed on the system console whenever a SERRC macro is issued by the operational program or a program interrupt occurs. The system error number and the dump sequence number are displayed as part of the message. Additional data may be appended to this message depending on the SERRC macro options used. This format is displayed if the system error occurs when the error is detected by an operational program.

**System Action:** This is dependent upon the prefix and the system error number in the message.

**User Response:** Determine the cause of the system error and take the appropriate action to correct the error.

See *Messages (System Error and Offline)* for more information about the system error number. Also see *TPF Main Supervisor Reference* for more information.

---

**CPSE0053T** **IS—***is* **SS—***ssn* **SSU—***ssun* **SE—***seqnum* **OPR—***perrnum* **CATASTROPHIC** *lniatac prog* **[***appended error message***]**

**Where:**

*is* The I-stream (displayed as a decimal number) where the error occurred.

*ssn* The four character subsystem name.

*ssun*
The four character subsystem user (SSU) name.

*seqnum*
The four character dump sequence number.

*p* The one character prefix.

*errnum*
The six character system error number.

*lniatac*
The line number, interchange address, and terminal address (LNIATA) and CPU ID of the terminal associated with the ECB finding the error.

*prog*
The real-time program finding the error.

*appended error message*
The error message (such as EOM CODED AND NO EOM IN STRING) is appended.

**Explanation:** This message is displayed on the system

console whenever a SERRC macro is issued by the operational program or a program interrupt occurs. The system error number and the dump sequence number are displayed as part of the message. Additional data may be appended to this message depending on the SERRC macro options used. This format is displayed if the system error occurs when the error is detected by an operational program.

**System Action:** If another irrecoverable system error is issued within 5 minutes of the initial error, a software IPL occurs.

**User Response:** Do the following:

1. Determine the cause of the system error.
2. Correct the error.

See *Messages (System Error and Offline)* for more information about the system error number. Also see *TPF Main Supervisor Reference* for more information.

---

**CPSE0055T IS—*is* SS—*ssn* SSU—*ssun* SE—*seqnum* MANUAL DUMP CATASTROPHIC**

**Where:**

*is* The I-stream (displayed as a decimal number) where the error occurred.

*ssn* The four character subsystem name.

*ssun*
The four character subsystem user (SSU) name.

*seqnum*
The four character dump sequence number.

**Explanation:** This message is issued when you initiate an irrecoverable IPL. For example, this could occur if you pressed the RESTART key on the system console.

**System Action:** The software IPL is initiated.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**CPSF0001E ERROR IN CYCLE DOWN**

**Explanation:** This message is displayed on the console if an error occurred while system error processing is trying to cycle down the TPF system during irrecoverable error recovery.

**System Action:** The TPF system bypasses the remainder of the cycle down and tries to initiate a software IPL.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**CPSF0002E CATASTROPHIC ERROR IN CYCLE UP**

**Explanation:** After a software IPL completed, an irrecoverable error was found while trying to cycle to the appropriate state.

**System Action:** The TPF system begins processing an irrecoverable error.

**User Response:** Do the following:

1. Determine the cause of the system error to ensure additional system problems have not occurred.
2. Correct the error.

See *TPF Main Supervisor Reference* for more information.

---

**CPSF0004E RETURN TO CPU LOOP**

**Explanation:** An initial irrecoverable error occurred.

**System Action:** Control is passed to the CPU loop at the end of system error processing.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**CPSF0005I RECOVERY TO 1052 STATE ONLY**

**Explanation:** An irrecoverable error occurred that was not defined within the CPSF segment as eligible for full recovery.

**System Action:** The cycle down process is skipped. Disk queues are processed, a software IPL is performed, and the TPF system is returned to 1052 state.

A full recovery means that the original state, which is usually NORM state, is returned to at the end of restart. In this case, the TPF system conditions do not allow automatic cycling above 1052 state.

Cycling is not inhibited.

**User Response:** Do the following:

1. Determine why the recovery stopped at 1052 state.
2. Correct the cause of the error.
3. Enter the ZCYCL command to cycle to NORM state, if necessary.

See *TPF Operations* for more information about the ZCYCL command. See *TPF Main Supervisor Reference* for more information.

---

**CPSF0006W IPL ABORTED — *reason***

**Where:**

*reason*
Indicates the reason the IPL was aborted. The reasons and their explanations are listed in the explanation for this message.

**Explanation:** An attempt to software IPL failed because of one of the following reasons:

- **MOUNT OF IPL VOLUME FAILED**

  A nonzero return code was received from the MSDAC macro while trying to mount the IPL volume. This indicates a software logic error since the IPL volume should not already be mounted and its symbolic device address (SDA) should be valid.

- **BSS IPL DEVICE ADDRESS NOT FOUND IN MFST**

  The SDA in the DOR block for the IPL device (label IPLDOR in CPSF) was not found in any of the MFST entries.

- **LAST IPL WAS FROM THE GENERAL FILE**

  No software IPL is attempted if the last IPL was from the loader general file. This message is sent when CPSF determines that the last IPL was from the general file and CPSE was unable to make the same determination for some reason.

- **LOAD OF IPLA FAILED – NON CC0 FROM PIOFC**

A nonzero return code was received from the PIOFC macro while trying to initiate loading of the IPLA program. This usually indicates a software logic error since CPSF should have already suspended normal input/output (I/O) operations (through the SPNDC macro) and the device should not be busy processing a previous I/O request. This message is also sent if the IPL device is not operational.

- **LOAD OF IPLA FAILED – OPERATION FAILED**

  A deferred condition code 3 was received while trying to load the IPLA program from the IPL device. This indicates that the device is not operational.

- **LOAD OF IPLA FAILED – RETRIES EXHAUSTED**

  The I/O operation to load the IPLA program from the IPL device was retried 10 times without receiving any response from the device.

- **SIGP STOP FAILED**

  Attempts by CPSF to send a SIGP STOP order to one or more I-streams in the CPC failed.

- **SIGP SENSE FAILED**

  Attempts by CPSF to send a SIGP SENSE order to one or more I-streams in the CPC failed. This message is sent only if the previous SIGP STOP order was successful.

- **UNEXPECTED STATUS FROM SIGP SENSE; WAS** *xxxxxxxx*

  CPSF succeeded in sending a SIGP SENSE order to one or more I-streams in the CPC. However, abnormal status data was returned to the issuing I-stream. The status is included in the message.

**System Action:** This message is followed by the CPSF0012W message and the TPF system enters a wait loop with only external interrupts enabled.

**User Response:** Do the following:

1. Obtain a dump of storage using the stand-alone dump facility or by pressing the RESTART key (02 on the OPRCTL frame).
2. Try a hardware IPL of the TPF system.

See *TPF Main Supervisor Reference* for more information.

---

**CPSF0008I CYCLE DOWN REQUEST ISSUED**

**Explanation:** A system error tried to cycle down the TPF system prior to a software IPL.

**System Action:** The TPF system is going through a software IPL. A full recovery is possible depending on the conditions.

**User Response:** Do the following:

1. Determine the cause of the system error.
2. Correct the cause of the error.
3. Cycle the TPF system to NORM state, if necessary.

See *TPF Main Supervisor Reference* for more information.

---

**CPSF0009W IPL INHIBITED**

**Explanation:** A software IPL will not be attempted due to an unrecoverable processor hardware failure.

**System Action:** The TPF system is in a wait loop with only external and I/O interrupts enabled. If a program check occurs, a disabled wait PSW results and IPL is inhibited.

**User Response:** Have your system programmer determine the cause of the error and correct it. A hardware IPL is required.

See *TPF Main Supervisor Reference* for more information.

---

**CPSF0010I DISK QUEUES PROCESSED**

**Explanation:** During irrecoverable system error processing, a loop is entered that allows all file macros awaiting service to complete.

**System Action:** When all file macros are completed, this message is sent to the system console.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**CPSF0012W SYSTEM IN WAIT LOOP**

**Explanation:** A software IPL failed and a wait state PSW was loaded.

**System Action:** The TPF system is in a wait loop with only external interrupts and I/O interrupts enabled. If a program check occurs, a disabled wait PSW results and IPL is inhibited.

**User Response:** Have your system programmer determine the cause of the error and correct it. A hardware IPL is required.

See *TPF Main Supervisor Reference* for more information.

---

**CPSF0013I SOFTWARE IPL INITIATED**

**Explanation:** This message is displayed on the console prior to a software IPL.

This is the normal response to the ZRIPL command.

**System Action:** The TPF system is processing a software IPL.

**User Response:** None.

See *TPF Operations* for more information about the ZRIPL command. See *TPF Main Supervisor Reference* for more information.

---

**CPSF0014W CRITICAL RECORD FILING COMPLETED**

**Explanation:** Irrecoverable system error filing of critical records completed successfully. Critical records filed include:

- RVT1
- RVT2
- SAT
- SRT
- WGTA.

This is a normal informational message.

**System Action:** System error processing is continued.

**User Response:** Cycle the TPF system to NORM state, if necessary.

See *TPF Main Supervisor Reference* for more information.

---

### CPSF0015W CRITICAL RECORD FILING ABORTED, TIMED OUT

**Explanation:** Irrecoverable system error filing of critical records timed out after 2 minutes.

**System Action:** This message is sent to the console when the system error fails to file all critical records. The TPF system continues with irrecoverable error recovery.

**User Response:** Critical records that were not filed will be identified when cycling is continued to NORM state. Recovery procedures for critical records vary depending on the circumstances.

See *TPF Main Supervisor Reference* for more information.

### CPSF0018E PROGRAM ERROR IN CCCPSF

**Explanation:** A program check occurred during irrecoverable error recovery. The error may have occurred in CCCPSF or in one of the recovery routines called by CCCPSF. This message is followed by a dump of the registers and program old PSW at the time of the error.

**System Action:** Processing is continued at the next step in the irrecoverable recovery process.

**Notes:**

1. Because the currently executing recovery routine is aborted, the possibility exists that one or more critical records were not filed to DASD.
2. If this error occurs while processing a CTL-C where there are no system work blocks (SWBs), the TPF system is working as designed.

**User Response:** See your IBM service representative.

### CPSF0020E CLH LOCK HELD AT LOCATION *addr*

**Where:**

*addr*
The address of the centralized list handling (CLH) lock.

**Explanation:** After successfully pausing all I-streams using SIGP EXTERNAL CALL, CPSE checks to see whether any of the CLH locks are held. If a lock is found to be held, CPSE assumes that an I-stream took a program check with one of the locks set, leaving the TPF system exposed to serious errors.

**System Action:** CPSF performs a software IPL without cycle down.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

### CPSF0021I CFLF LOCK CLEAR COMPLETED

**Explanation:** Irrecoverable system error processing successfully disconnected all active CFLF control units, effectively clearing all held CFLF locks.

**System Action:** None.

**User Response:** None.

### CPSF0022W CFLF LOCK CLEAR ABORTED, TIMED OUT

**Explanation:** While trying to clear CFLF locks during irrecoverable system error processing, the 2 minute time-out value was exceeded.

**System Action:** System error processing is continued.

**User Response:** None.

### CPSF0023W NO 328X PRT AVAILABLE— IPL CONTINUES

**Explanation:** A nonzero return code was received from the MSDAC macro while trying to mount the receive-only (RO) console. This is a warning to indicate a possible loss of the RO console. A similar message, IPLA0005W or IPLB0032I, is issued during IPL processing.

**System Action:** The IPL is continued.

**User Response:** Do the following:

1. Investigate the status of the RO console (especially if you are using an automation product such as IBM Extended Operations Console Facility/2 (EOCF/2) or another automated management system).
2. Restore the RO console to operation, if appropriate.

See *TPF System Macros* for more information about the MSDAC macro. Also see *TPF Main Supervisor Reference* for more information about IPL processing.

### CPSF0025W CFLF LOCK FENCING ERROR

**Explanation:** This message accompanies the 000700 system error and is caused by one of the following:

- On a SET LOCK STATE or UNLOCK order, the token ID was not recognized by the concurrency filter lock facility (CFLF) subsystem. If the token ID is valid, then this user ID was disconnected by another processor and is now lock fenced.
- A SET LOCK STATE or UNLOCK order was attempted while an asynchronous disconnect order was still processing.

**System Action:** The processor is taken down immediately and placed into a disabled wait state.

**User Response:** None.

### CPSF0026A FALLBACK KEYPTS COPIED

**Explanation:** During restart it was found that the keypoints used to IPL were not prime or prime duplicate keypoints. Therefore, the fallback keypoints were copied from the extent area on the prime module to the keypoint area on the prime module. This message indicates that the copying of the fallback keypoints was successful.

**System Action:** The TPF system enters a disabled wait state.

**User Response:** Perform a hardware IPL to use the image-related records from the prime module.

**CPSF0026W DISK/TAPE/COMMS QUEUE PROCESSING ABORTED, TIMED OUT**

**Explanation:** An irrecoverable system error clearing DASD, SNA, and tape queues timed out. This message is sent to the console when a time interval of 10 seconds proved insufficient to clear all DASD, SNA, and tape queues.

**System Action:** Processing is continued at the next step in the irrecoverable recovery process.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

**CPSF0028W COUPLING FACILITY LOCK FENCE ERROR**

**Explanation:** This message accompanies the 004628 system error and is caused by one of the following:

- On a SET LOCK STATE or UNLOCK order, the token ID was not recognized by the concurrency filter lock facility (CFLF) subsystem. If the token ID is valid, then this user ID was disconnected by another processor and is now lock fenced.
- On a coupling facility (CF) locking request, the TPF system was not recognized by the CF. If the TPF system is valid, then it was disconnected from the CF locking structure by another processor and is now lock fenced.

**System Action:** The processor is taken down immediately and placed into a disabled wait state.

**User Response:** None.

**CPSF0030W CFLF DISCONNECT ERROR *rc* FOR USER ID *user ID*, PARTITION *part*.**

**Where:**

*rc* The return code from the CFLF disconnect message. Return code 00 indicates that an error was detected by CPSF before the I/O request was issued, reflecting a possible setup or logic error.

*user ID*
The CFLF user ID for whom the disconnect was attempted.

*part*
The CFLF lock partition for which the disconnect was attempted.

**Explanation:** While trying to clear CFLF locks during irrecoverable system error processing, a disconnect failure was detected.

**System Action:** System error processing continues with the next available CFLF subsystem.

**User Response:** See *3990 Transaction Processing Facility Support RPQs* for a description of the disconnect return code.

**CPSF0098I LOCK PROCESSING COMPLETED**

**Explanation:** During irrecoverable system error processing an attempt is made to clear all active locks in all control units. This message is sent to the console upon successful clearing of the locks. This applies only to TPF high performance option (HPO) systems that are running loosely coupled.

**System Action:** None.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

**CPSF0099E CU UNLOCKS FAILED: *cu* [[*cu*] ... ] [MORE]**

**Where:**

*cu* The control unit.

**Explanation:** During irrecoverable system error processing an attempt is made to clear all active locks in all control units. This message is sent to the console when the system error fails to clear all the locks. This applies only to TPF high performance option (HPO) systems that running loosely coupled.

**System Action:** System error processing is continued.

**User Response:** The devices are available for your use once system error processing is completed.

See *TPF Main Supervisor Reference* for more information.

# CQAI–CSMP

**CQAI0080E CTKI RETRIEVAL ERROR - UNABLE TO CHECK FOR STR EXTERNAL INTERRUPT**

**Explanation:** Keypoint I (CTKI) could not be retrieved from disk while processing the Sysplex Timer (STR) external interrupt routine.

For Sysplex Timer Attachment Facility-1 (STAF-1), the external interrupt polling routine could not determine if an STR external interrupt occurred since the last time the polling routine was processed.

For Sysplex Timer Attachment Facility-2 (STAF-2), an STR Alert external interrupt occurred, but it is not possible to determine whether the interrupt was caused by a service request or a time adjustment.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON).

**System Action:** For STAF-1, the polling routine is scheduled to be processed again.

For STAF-2, the external interrupt is not logged for the Environmental Error Record Editing and Printing (EREP) program.

**User Response:** Do the following:

1. Determine why CTKI could not be retrieved from disk.
2. Correct the error.

For STAF-2, report the external interrupt to your IBM service representative.

**CQAI0081E ERROR READING STR DATA — UNABLE TO CHECK FOR STR EXTERNAL INTERRUPT**

**Explanation:** A required data word could not be obtained from the Sysplex Timer (STR) while processing the STR external interrupt routine. As a result, for Sysplex Timer

Attachment Facility-1 (STAF- 1), the polling routine could not determine whether an STR external interrupt had occurred since the last time the polling routine was processed.

For Sysplex Timer Attachment Facility-2 (STAF-2), it is known that an STR Alert external interrupt occurred but it is not possible to determine whether the interrupt was caused by a service request or a time adjustment.

For STAF-1, there may be a problem with the processor controller.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON).

**System Action:** For STAF-1, the polling routine is scheduled to be processed again.

For STAF-2, the external interrupt is not logged for the Environmental Error Record Editing and Printing (EREP) program.

**User Response:** See your IBM service representative.

---

**CQAI0082W STR SERVICE IS REQUESTED**

**Explanation:** A Sysplex Timer (STR) external interrupt occurred indicating that service may be required on the STR. The purpose of this request depends upon the STR and is published in *Maintenance Information for the 9037 Sysplex Timer*.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON).

**System Action:** The request is logged for the Environmental Error Record Editing and Printing (EREP) program.

**User Response:** See your IBM service representative.

See the console for the Sysplex Timer (STR) for more information.

---

**CQAI0083W STR TIME OFFSET CHANGES HAVE OCCURRED**

**Explanation:** A Sysplex Timer (STR) external interrupt was received indicating one of the following:

- A leap second increment or decrement occurred.
- The local time offset changed because of a change in the local daylight savings time.

The local time offset given by the Sysplex Timer is not used by the TPF system to set the clock.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON).

**System Action:** The condition is logged for the Environmental Error Record Editing and Printing (EREP) program.

**User Response:** When you enter a ZATIM command to set the time-of-day (TOD) clock, the new leap second offset is used. Follow your local practice for daylight savings time adjustment.

See the console for the Sysplex Timer (STR) for more information.

---

**CQAI0084W PORT *portnum* AVAILABILITY CHANGE OCCURRED**

**Where:**

*portnum*
The CPC port number.

**Explanation:** The CPC port connected to the Sysplex Timer (STR) has gone from operational to not operational or vice versa. If the primary port and the alternate port started out in synchronization and one of these ports is still operational, then the CPC synchronization is maintained. If none of the ports are operational, CPC synchronization is lost and appropriate error processing occurs.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (Enterprise Systems Connection).

**System Action:** STR information is gathered for each of the CPC ports. This information is logged for the Environmental Error Record Editing and Printing (EREP) program.

**User Response:** Seee your IBM service representative.

---

**CQAI0085I STR LINK TUNING CHANGE HAS OCCURRED**

**Explanation:** A change in the tuning status of the ports connected to the Sysplex Timer (STR) occurred.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON).

**System Action:** STR information is gathered for each of the CPC ports. This information is logged for the Environmental Error Record Editing and Printing (EREP) program.

**User Response:** See your IBM service representative. The CPC may need to be resynchronized by entering the ZATIM command if synchronization is lost within the complex.

See the console for the Sysplex Timer (STR) for more information.

---

**CRD90010I HCT INITIALIZATION SUCCESSFUL ENTRIES INITIALIZED — *entries***

**Where:**

*entries*
The number of hot conversation table (HCT) entries. that were initialized.

**Explanation:** The TPF Application Requester (TPFAR) hot conversation (HCT) was initialized successfully during restart processing.

**System Action:** None.

**User Response:** None.

See the *TPF Application Requester User's Guide* for more information.

---

**CRD90012W HCT NOT INITIALIZED, NO ENTRIES ALLOCATED**

**Explanation:** There were no TPF Application Requester (TPFAR) hot conversation table (HCT) entries defined in keypoint 2. Therefore, the table was not initialized.

**System Action:** None.

**User Response:** If you want to initialize the HCT, do one of the following:

- Enter the ZNKEY with the MAXHCT parameter specified.
- Load another copy of keypoint 2.

See *TPF Operations* for more information about the ZNKEY command. Also see the *TPF Application Requester User's Guide* for more information.

**CRD90020I SDD INITIALIZATION SUCCESSFUL ALLOCATED — *xxxxx*, COPIED — *yyyyy***

**Where:**

*xxxxx*
The number of structured query language (SQL) database directory (SDD) entries allocated by Keypoint 2 (CK2SDDN).

*yyyyy*
The number of SQL SDD entries filled in with the SQL database directory entry information on file.

**Explanation:** The TPF Application Requester (TPFAR) initialization of the SQL SDD completed successfully.

**System Action:** None.

**User Response:** None.

See the *TPF Application Requester User's Guide* for more information.

**CRD90021I MIGRATION OF CORE COPY OF SDD SUCCESSFUL MIGRATION OF FILE COPY AT NEXT UPDATE**

**Explanation:** The TPF Application Requester (TPFAR) migration of the structured query language (SQL) database directory (SDD) completed successfully. The migration of the file copy takes place only after the ZSQLD command with the ADD or MODIFY parameter was entered. The migration may have changed the size of the entries and the type of record.

**System Action:** None.

**User Response:** None.

See the *TPF Application Requester User's Guide* for more information.

**CRD90022W SDD NOT INITIALIZED, NO ENTRIES ALLOCATED**

**Explanation:** There were no structured query language (SQL) database directory (SDD) entries allocated or initialized, because there were no entries defined in keypoint 2 (CK2SDDN).

**System Action:** Processing is continued.

**User Response:** If you want to allocate the SDD entries in the TPF system, do one of the following:

- Enter the ZNKEY command with the MAXSDD parameter specified.
- Load another copy of keypoint 2.

See *TPF Operations* for more information about the ZNKEY command. Also see the *TPF Application Requester User's Guide* for more information.

**CRD90024W HOT CONVERSATIONS REQUESTED BY SDD EXCEED HCT ENTRIES ALLOCATED ALLOCATED –*xxxxx*, REQUESTED –*yyyyy***

**Where:**

*xxxxx*
The number of hot conversation table entries provided by keypoint 2 (CK2HCTN).

*yyyyy*
The number of hot conversations requested for all the structured query language (SQL) database directory (SDD) entries.

**Explanation:** The number of hot conversations required for all the structured query language (SQL) database directory (SDD) entries exceeds the number of hot conversation table entries provided by keypoint 2 (CK2HCTN).

**System Action:** The maximum number of hot conversation table entries are allocated starting from the top of the structured query language (SQL) database directory (SDD).

**User Response:** Do one of the following:

- Ensure that the correct number of hot conversations table entries exist or alter the number of hot conversations required.
- Do one of the following:
  - Enter the ZNKEY command with the MAXHCT parameter specified to add more hot conversation table entries (CK2HCTN.
  - Enter the ZSQLD command to alter the number of hot hot conversations required for the SQL databases. the SQL databases.

See *TPF Operations* for more information about the ZNKEY and ZSQLD commands. Also see the *TPF Application Requester User's Guide* for more information.

**CRD90026E SDD NOT INITIALIZED, ERROR ON FIRST FIND. FIND ERROR ADDR —*address***

**Where:**

*address*
The structured query language (SQL) database directory (SDD) record file address.

**Explanation:** An error occurred accessing the first structured query language (SQL) database directory (SDD) record at the file address specified in the message.

**System Action:** Processing is continued.

**User Response:** Initialize the SDD record using the Initialize option on the ZSQLD command.

See *TPF Operations* for more information about the ZSQLD

command. Also see the *TPF Application Requester User's Guide* for more information.

---

**CRD90028E SDD NOT INITIALIZED, FACS ERROR.**

**Explanation:** An file address compute program (FACE) error occurred when accessing the structured query language (SQL) database directory (SDD).

**System Action:** Processing is continued.

**User Response:** Verify the SDD record type allocation.

See the *TPF Application Requester User's Guide* for more information.

---

**CRDH0010W TPFAR SQLH ERROR, RESOURCE LIMIT AT APPL SERVER, RETRY. SQLCODE** *code*, **SQLSTATE** *state*

**Where:**

*code*
The structured query language (SQL) code returned to the application program.

*state*
The SQL state returned to the application program.

**Explanation:** TPF Application Requester (TPFAR) processing failed because of insufficient application server resources that are non-relational-database (RDB) resources. This failure has no effect on subsequent SQL commands and requests.

**System Action:** The SQLCODE and SQLSTATE are returned to the application program.

**User Response:** Because a problem occurred in the application server due to insufficient non-RDB resources, you should try the SQL statement again.

See the *TPF Application Requester User's Guide* for more information.

---

**CRDH0012W TPFAR SQLH ERROR, RESOURCE LIMIT AT APPL SERVER, NO RETRY. SQLCODE** *code*, **SQLSTATE** *state*

**Where:**

*code*
The structured query language (SQL) code returned to the application program.

*state*
The SQL state returned to the application program.

**Explanation:** TPF Application Requester (TPFAR) processing failed because of insufficient application server resources that are non-relational-database (RDB) resources. This failure affects subsequent SQL statements.

**System Action:** The SQLCODE and SQLSTATE are returned to the application program.

**User Response:** Because a problem occurred in the application state due to insufficient non-RDB resources, you should not try the SQL statement again.

See the *TPF Application Requester User's Guide* for more information.

---

**CRDH0020W TPFAR SQLH ERROR, REMOTE RDB AUTHORIZATION FAILURE. SQLCODE** *code*, **SQLSTATE** *state*

**Where:**

*code*
The structured query language (SQL) code returned to the application program.

*state*
The SQL state returned to the application program.

**Explanation:** An unauthorized user tried to access the requested relational database (RDB).

**System Action:** The SQLCODE and SQLSTATE are returned to the application program.

**User Response:** Verify the authorization for this RDB and, if necessary, correct the authorization.

See the *TPF Application Requester User's Guide* for more information.

---

**CRDH0022W TPFAR SQLH ERROR, RDB NOT FOUND. SQLCODE** *code*, **SQLSTATE** *state*

**Where:**

*code*
The structured query language (SQL) code returned to the application program.

*state*
The SQL state returned to the application program.

**Explanation:** You tried to access a relational database (RDB) that could not be found.

**System Action:** The SQLCODE and SQLSTATE are returned to the application program.

**User Response:** Validate the RDB requested in the command and take the appropriate action.

See the *TPF Application Requester User's Guide* for more information.

---

**CRDH0024W TPFAR SQLH ERROR, IMPLIED ROLLBACK OCCURRED. SQLCODE** *code*, **SQLSTATE** *state*

**Where:**

*code*
The structured query language (SQL) code returned to the application program.

*state*
The SQL state returned to the application program.

**Explanation:** TPF Application Requester (TPFAR) detected an error caused by an implied rollback.

**System Action:** An implied rollback is issued and the entry control block (ECB) is exited.

**User Response:** Investigate the cause of the implied rollback.

See the *TPF Application Requester User's Guide* for more information.

### CRDW0001W NO SQL TRACE TABLE DEFINED FOR THE SYSTEM

**Explanation:** The structured query language (SQL) trace table was not defined for the TPF system.

**System Action:** None.

**User Response:** Do one of the following:

- If the SQL trace table is necessary, enter the ZNKEY command with the MAZSMTB parameter.
- Load an update copy of keypoint 2 again.

See *TPF Operations* for more information about the ZNKEY command. Also see the *TPF Application Requester User's Guide* for more information.

### CRDW0002W NO SQL TRACE TABLE ENTRIES

**Explanation:** The structured query language (SQL) trace table does not contain any entries for the I-stream requested. No SQL commands were processed by any application programs on that I-stream.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTTD command. Also see the *TPF Application Requester User's Guide* for more information.

### CRDW0004I SQL TRACE TABLE FOR I-STREAM *nn*

**Where:**

*nn* The I-stream (displayed as a decimal number) that was specified in the ZSTTD command. The default is 1.

**Explanation:** This is the first line of the normal response to a request to display the structured query language (SQL) trace table. It is followed by a display of the trace table. The entries in the table for the specified I-stream are displayed when they meet the specified selection criteria. The displayed trace table entries reflect the subsystem where the ZSTTD command was entered.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTTD command. Also see the *TPF Application Requester User's Guide* for more information.

### CRDW0005E I-STREAM SUPPLIED IS INVALID

**Explanation:** The I-steam supplied with the optional IS parameter is not currently active. Therefore, there is no structured query language (SQL) trace table associated with the I-stream.

**System Action:** None.

**User Response:** Determine the correct active I-stream that contains the SQL trace information and supply it with the IS parameter.

See *TPF Operations* for more information about the ZSTTD command. Also see the *TPF Application Requester User's Guide* for more information.

### CRT00001I RIAT INITIALIZATION COMPLETE FOR VFADEF RECORD

**Explanation:** The virtual file access (VFA) data that was entered previously via the ZRTDM command was loaded from the VFA definition record on file into the correct slots in the in-core record ID attribute table (RIAT).

**System Action:** None.

**User Response:** None.

### CRT00050E ERROR TRYING TO RETRIEVE VFA DEFINITION RECORD FROM DASD

**Explanation:** An error occurred during a FINWC macro, while trying to retrieve the virtual file access (VFA) definition record, in the CRT0 segment.

**System Action:** The segment will BACKC to the CTKO restart scheduler.

**User Response:** See your system programmer for more information.

### CRT00051E ERROR DURING FACS PROCESSING FOR RECORD TYPE #VFARD — RIAT INITIALIZATION ABORTED

**Explanation:** An error occurred during a call FACS while processing the virtual file access (VFA) definition record in the CRT0 segment.

**System Action:** The segment will BACKC to the CTKO restart scheduler.

**User Response:** See your system programmer for more information.

### CRZ10007E CHAIN CHASE – INVALID FILE ADDRESS

**Explanation:** An error occurred when entering the ZCHCH command with the FILEADDR parameter specified. The file address specified is not valid.

**System Action:** The ZCHCH command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZCHCH command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZCHCH command.

### CRZ10008E CHAIN CHASE – INCORRECT COUNT FIELD

**Explanation:** The ZCHCH command was entered with an incorrect value specified for the maximum number of chained records to be chased. The value specified must be from 1 to 999.

**System Action:** The command is rejected.

**User Response:** Enter the ZCHCH command again specifying a valid value for the maximum number of chained records to be chased.

See *TPF Operations* for more information about the ZCHCH command.

---

**CRZ10010E MESSAGE *addr* WITH DISP *loc* IS OUT OF RANGE**

**Where:**

*addr*
The chain address.

*loc* The 3-byte hexadecimal displacement.

**Explanation:** The ZCHCH command was entered with a displacement (location) value specified that is not valid; it exceeds the record size range. The value specified must be a 3-byte hexadecimal displacement (location) in the chain chase where the file pool addresses of the next record in that chain chase is found.

**System Action:** The command is rejected.

**User Response:** Enter the ZCHCH command again specifying a valid displacement (location) value that is within the record size chain.

See *TPF Operations* for more information about the ZCHCH command.

---

**CRZ10011I CHAIN CHASE-BACKWARD**

**Explanation:** This is the normal response to the ZCHCH command with the B parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCHCH command and for an example of the informational display.

---

**CRZ10012I CHAIN CHASE-DISPL.*loc***

**Where:**

*loc* The location in the chain chase at which the file pool address of the next record in that chain chase is found.

**Explanation:** This is the normal response to the ZCHCH command with the U parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCHCH command and for an example of the informational display.

---

**CRZ10013E CHAIN CHASE - INPUT HDR VALUE IS INCORRECT**

**Explanation:** The ZCHCH command was entered with an incorrect value specified for the HDR parameter. The value must be either 4 or 8.

**System Action:** The command is rejected.

**User Response:** Enter the ZCHCH command again and specify a valid value for the HDR parameter.

See *TPF Operations* for more information about the ZCHCH command.

---

**CRZ10014E CHAIN CHASE - INCONSISTENT FILE ADDRESS AND HDR VALUE INPUT**

**Explanation:** The ZCHCH command was entered with a file address and a value for the HDR parameter that do not coexist. If you specify a value of 4 for the HDR parameter, the specified file address must be a 4-byte file address or an 8-byte file address in 4x4 format. If you specify a value of 8 for the HDR parameter, the specified file address must be an 8-byte FARF6 address or an 8-byte file address in 4x4 format.

**System Action:** The command is rejected.

**User Response:** Enter the ZCHCH command again and specify a valid file address and HDR parameter value combination.

See *TPF Operations* for more information about the ZCHCH command.

---

**CRZ10015I CHAIN CHASE-FORWARD**

**Explanation:** This is the normal response to the ZCHCH command with the F parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCHCH command and for an example of the informational display.

---

**CSAV0000I OPERATION COMPLETE**

**Explanation:** The ZDEBB command was entered and the requested function has been completed successfully.

**System Action:** None.

**User Response:** None.

---

**CSAV0001E I/O ERROR — OPERATION ABORTED**

**Explanation:** The ZDEBB command was entered to do one of the following:

- Shift the blocked tape forward one or more logical records
- Shift the blocked tape backward the specified number of physical blocks
- Perform a read operation.

However, an input/output (I/O) error occurred.

**System Action:** The tape is positioned following the record that received the I/O error (or before the record if the operation was to shift the blocked tape backward).

**User Response:** None.

See *TPF Operations*for more information about the ZDEBB command.

---

**CSAV0002I TAPEMARK DETECTED**

**Explanation:** The ZDEBB command was entered to do one of the following:

- Shift the blocked tape forward one or more logical records
- Shift the blocked tape backward the specified number of physical blocks

- Perform a tape read operation.

However, the request was ended because a tapemark was detected.

**System Action:** The tape is positioned following the tapemark (or before the tapemark if the operation was to shift the blocked tape backward).

**User Response:** None.

See *TPF Operations* for more information about the ZDEBB command.

---

**CSAV0003E INVALID ID**

**Explanation:** The format of the ZDEBB command is not correct.

**System Action:** The ZDEBB command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZDEBB command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZDEBB command.

---

**CSAV0004E INVALID FORMAT OR INPUT DATA**

**Explanation:** The format of the ZDEBB command is not correct.

**System Action:** The ZDEBB command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZDEBB command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZDEBB command.

---

**CSAV0005E SYSTEM CYCLING TO 1052 STATE OR GFS NOT ACTIVE**

**Explanation:** An error occurred because the ZDEBB command was entered with the TD or TP parameter specified when the get file storage (GFS) facility was not active or before the TPF system was in 1052 state.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait for the TPF system to cycle down.
2. Cycle up the TPF system to or past computer room agent set (CRAS) state.
3. Enter the ZDEBB command again and specify the TD or TP parameter.

See *TPF Operations* for more information about the ZDEBB command.

---

**CSAV0006E TAPE NOT MOUNTED**

**Explanation:** An error occurred while entering the ZDEBB command because the DBL tape was not mounted.

**System Action:** The ZDEBB command is rejected.

**User Response:** Do the following:

1. Enter the ZTMNT command to mount the DBL tape.
2. Enter the ZDEBB command again.

See *TPF Operations* for more information about the ZDEBB and ZTMNT commands.

---

**CSAV0007E TAPE IS IN USE BY ANOTHER ENTRY**

**Explanation:** An error occurred while entering the ZDEBB command. The requested function cannot be performed on the specified device because the tape routines are already using that device.

**System Action:** The ZDEBB command is rejected.

**User Response:** Do the following:

1. Wait for the routines that are currently using the specified device to complete processing.
2. Enter the ZDTAP command to determine if you have to enter the ZDEBB command.
3. Enter the ZDEBB command again and specify the same device or a different device.

See *TPF Operations* for more information about the ZDEBB and ZDTAP commands.

---

**CSAV0007E TAPE NOT BLOCKED**

**Explanation:** An error occurred while entering the ZDEBB command because the tape is not blocked.

**System Action:** The ZDEBB command is rejected.

**User Response:** Do one of the following:

- Mount a blocked tape before entering the ZDEBB command again.
- Enter the ZDEBE command to use unblocked tapes.

See *TPF Operations* for more information about the ZDEBB and ZDEBE commands.

---

**CSAW0000I** *xxxxxxxxxx*

**Where:**

*xxxxxxxxxx*
The record being displayed.

**Explanation:** This is the normal response to the ZDEBB command with one of the display and print tape block parameters specified.

**System Action:** The record is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZDEBB command.

**CSD40001W** *xx* **ADDITIONAL** *comd* **COMMAND(S) WERE REJECTED WITH** *code* **FOLLOWING ARE THE NAU NAMES:** *nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau*

**Where:**

*xx* The number of additional commands that generated the same negative response.

*comd*
The command that generated the negative response.

*code*
The negative response.

*nau* The name of the network addressable unit (NAU) that received this negative response.

**Explanation:** The TPF system received the same command and negative response more than one time as specified in the message. The first time this pair (the command and negative response) is received, a message is sent to the terminal, dump, or both. The time between that and when this message is issued depends on the value set in the SNSETO field of keypoint 2.

**System Action:** The NAUs that received this negative response are processed normally.

**User Response:** If the cause of the negative response is unknown, you should determine the cause of the error.

See *TPF ACF/SNA Network Generation* for more information.

---

**CSD40002W** *xx* **ADDITIONAL** *comd* **COMMAND(S) WERE RECEIVED FOLLOWING ARE THE NAU NAMES:** *nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau nau*

**Where:**

*xx* The number of additional commands received.

*comd*
The command.

*nau* The name of the network addressable unit (NAU) that received this command.

**Explanation:** The TPF system received the same command more than one as specified in the message. This message is issued only for commands that end a process or function. The first time this command is received, a message is sent to the terminal, dump, or both. The time between that and when this message is issued depends on the value set in the SNSETO field of keypoint 2.

**System Action:** The NAUs that received this negative response are processed normally.

**User Response:** If the cause of the negative command is unknown, you should determine the cause of the error.

See *TPF ACF/SNA Network Generation* for more information.

---

**CSG00000I FRESH LOAD OF SNA TABLES COMPLETED**

**Explanation:** Initialization of the SNA core records completed. Tables were built and filed.

**System Action:** None.

**User Response:** None.

---

**CSG00001E SRT LOAD FAILURE – RVT2/SRT RESYNC. BEGUN**

**Explanation:** It was discovered during a non-fresh load of the SNA tables that the system recovery table (SRT):

- Was not keypointed properly
- Contains incorrect data
- Could not be loaded.

**System Action:** The SRT is rebuilt and the SRT indicators are removed from the RVT2.

**User Response:** None.

---

**CSG00002I DYNAMIC LOAD OF SNA TABLES COMPLETED**

**Explanation:** The SNA core records were updated dynamically to the current RRT definitions.

**System Action:** None.

**User Response:** None.

---

**CSG00003I NON-FRESH LOAD OF SNA TABLES COMPLETED**

**Explanation:** SNA core records were determined to be current or were reloaded from the keypointed copy.

**System Action:** None.

**User Response:** None.

---

**CSG00051E RDLR CURRENT LOAD TYPE INVALID, SNA RESTART BYPASSED**

**Explanation:** During an IPL, it could not be determined from the Root Dynamic Load Record (RDLR) whether a Dynamic or Fresh Load was to be performed.

**System Action:** SNA restart is bypassed and the IPL is continued.

**User Response:** None.

---

**CSG40050E RESTART ABORTED STATE CHANGE DISABLED**

**Explanation:** A serious error occurred during SNA restart.

**System Action:** The TPF system aborts cycling to 1052 state.

**User Response:** See the previous error message issued for more information.

---

**CSG40052E INSUFFICIENT NON-LU SPACE FOR FRESH LOAD, NUMBER OF NON-LUS NOT BEING LOADED – *xx***

**Where:**

*xx* The number non-LU resources not being loaded.

**Explanation:** The size of the non-LU section in the resource vector table (RVT) is not large enough to load all of the adjacent link station (ALS), cross-domain resource manager (CDRM), channel-to-channel (CTC), and network control program (NCP) resources during the fresh load.

**System Action:** Processing continues.

**User Response:** Increase the size of the non-LU section in the RVT by increasing the value assigned to the NUMALS parameter in the SNAKEY macro.

See *TPF ACF/SNA Data Communications Reference* for more information about the SNAKEY macro.

**CSG40053E I/O ERROR OCCURRED ON RETRIEVING NCB CONTROL RECORD, NCB DATABASE NOT AVAILABLE FOR DYNAMIC LU**

**Explanation:** The TPF system could not initialize the node control block (NCB) database because an error occurred while retrieving the NCB control record.

**System Action:** Dynamic LU support is not enabled in the TPF system; that is, LU resources cannot log on to the TPF system unless they are defined using the offline ACF/SNA table generation (OSTG) program.

**User Response:** See your system programmer for more information.

See *TPF ACF/SNA Data Communications Reference* for more information about dynamic LU support and the NCB control record.

**CSG40054W FRESH LOAD FORCED DUE TO NUMALS BEING CHANGED**

**Explanation:** A fresh load was performed because the value assigned to the NUMALS parameter in the SNAKEY macro was increased. Increasing the value assigned to the NUMALS parameter increases the size of the non-LU section in the resource vector table (RVT).

**System Action:** The TPF system performs a fresh load.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about fresh loads. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

**CSG40055E FACS ERROR OCCURRED ON NCBN4, THIS SYSTEM IS RUNNING WITHOUT DYNAMIC LU SUPPORT**

**Explanation:** A file address retrieval program (FACS) error occurred while locating an NCBN4 record because no NCBN4 records were defined for the TPF system.

**System Action:** Dynamic LU support is not enabled in the TPF system; that is, LU resources cannot log on to the TPF system unless they are defined using the offline ACF/SNA table generation (OSTG) program.

**User Response:** See your system programmer for more information.

See *TPF ACF/SNA Data Communications Reference* for more information about dynamic LU support.

**CSG50001I RVT1 CORE COPY REUSED**

**Explanation:** It was determined that the content of the core copy of the RVT1 is still valid across the software IPL. The core copy will be used instead of refreshing it from file.

**System Action:** None.

**User Response:** None.

**CSG50002I RVT1 RELOADED FROM FILE**

**Explanation:** On a hardware IPL or an irrecoverable software IPL where the content of the core copy could not be validated, the RVT1 is reloaded from file.

**System Action:** None.

**User Response:** None.

**CSG50003I RVT2 CORE COPY REUSED**

**Explanation:** It was determined that the content of the core copy of the RVT2 is still valid across the software IPL. The core copy will be used instead of refreshing it from file.

**System Action:** None.

**User Response:** None.

**CSG50004I RVT2 RELOADED FROM FILE**

**Explanation:** On a hardware IPL or an irrecoverable software IPL where the content of the core copy could not be validated, the RVT2 is reloaded from file.

**System Action:** None.

**User Response:** None.

**CSG50005I SAT CORE COPY REUSED**

**Explanation:** It was determined that the content of the core copy of the subarea address table (SAT) is still valid across the software IPL. The core copy will be used instead of refreshing it from file.

**System Action:** None.

**User Response:** None.

**CSG50006I SAT RELOADED FROM FILE**

**Explanation:** On a hardware IPL or an irrecoverable software IPL where the content of the core copy could not be validated, the subarea address table (SAT) is reloaded from file.

**System Action:** None.

**User Response:** None.

**CSG60007I SRT CORE COPY REUSED**

**Explanation:** It was determined that the content of the core copy of the system recovery table (SRT) is still valid across the software IPL. The core copy will be used instead of refreshing it from file.

**System Action:** None.

**User Response:** None.

**CSG60008I SRT RELOADED FROM FILE**

**Explanation:** On a hardware IPL or an irrecoverable software IPL where the content of the core copy could not be validated, the system recovery table (SRT) is reloaded from file.

**System Action:** None.

**User Response:** None.

**CSG60009E NO AVAILABLE SRT SLOTS IN THE SYSTEM RECOVERY TABLE; RECOVERABLE MESSAGES WILL BE LOST; SRT AND RVT RE-SYNCHRONIZATION WILL BE INITIATED BY SNA RESTART**

**Explanation:** On a hardware IPL, a software IPL or an irrecoverable software IPL, when it is determined that no system recovery table (SRT) slots are available on cycling the TPF system to NORM state, the SRT and resource vector table (RVT) are synchronized again.

**System Action:** The following information is lost:

- Recoverable messages references by the SRT
- File records that contain the recoverable messages.

This message is followed by a OPR-4A9 dump with the appended text of NO AVAILABLE SLOTS IN SR0RT.

**User Response:** Do one of the following:

- Adjust the shutdown levels for communication to reduce the number of messages being processed by the TPF system at one time. (This is a short-term solution.)
- Increase the size of the system recovery table (SRT) to accommodate the level of SNA recoverable message traffic (number of SRT slots and the number of SRT records on file).
- Isolate and correct the cause if you suspect that recoverable messages are not being completed and the SRT slots are not being made available.

**CSG70001E NAT RID CONFLICT — *xxxx* IN USE, *yyyy* SKIPPED**

**Where:**

*xxxx*
The resource identifier (RID) of the network address table (NAT) entry in use.

*yyyy*
The RID of the resource to be added.

**Explanation:** When initializing the network address table (NAT), an attempt is made to add a network address that is already in use by another resource.

**System Action:** The resource to be added is skipped and processing is continued with the next resource.

**User Response:** Using the RIDs provided, the resource definitions should be reviewed to determine why the conflict occurred.

**CSG70050E THE PSV NAMES BELOW WERE GENNED BUT ARE NOT ONLINE** *psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv psv*

**Where:**

*psv* The process selection vector (PSV) name. The display can contain a maximum of four lines with a maximum of seven names in each line.

**Explanation:** The PSV names generated by the offline ACF/SNA table generation (OSTG) were not defined in COBU.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about the process selection vector (PSV).

**CSGB0001E CIOSC MOUNT ERROR – SDA *xxxx* NOT DEFINED**

**Where:**

*xxxx*
The symbolic device address (SDA).

**Explanation:** An attempt was made to mount an ALS/NCP that was indicated as active in the resource vector table (RVT) but the TPF system returned a SDA not defined indicator.

**System Action:** The current RVT entry is skipped and processing is continued with the next ALS/NCP.

**User Response:** Review the IOCP and the RVT entry to determine why the SDA conflict occurred.

**CSGB0002I AUTOMATIC NETWORK SHUTDOWN OF *xxxxxxxx* COMPLETE**

**Where:**

*xxxxxxxx*
The network control program (NCP) name.

**Explanation:** Following a hardware IPL, a DISCONNECT was issued to each active FID4 NCP.

**System Action:** An automatic network shutdown occurred.

**User Response:** Restart the network.

**CSGC0001I XID ERROR. LOST TERMINAL CLEANUP INVOKED.**

**Explanation:** An error was detected on completion of a non-activation exchange ID (XID) issued to restart an adjacent link station (ALS) by the CSGB segment. The CSEJ segment was entered to perform lost terminal cleanup processing.

**System Action:** None.

**User Response:** None.

**CSGC0002I NCP SENSE ERROR. LOST TERMINAL CLEANUP INVOKED.**

**Explanation:** An error was detected on completion of a network control program (NCP) sense issued to restart an NCP by the CSGB segment. The CSEJ segment was entered to perform lost terminal cleanup processing.

**System Action:** None.

**User Response:** None.

**CSGH0001I RTPCB BUILT AND FILED**

**Explanation:** This message is displayed during Systems Network Architecture (SNA) restart after the rapid transport protocol control block (RTPCB) table is built and filed.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about the RTPCB table.

**CSGH0002I RTPCB CORE COPY REUSED**

**Explanation:** This message is displayed when the core copy of the rapid transport protocol control block (RTPCB) table is valid and used again during a nonfresh load of the Systems Network Architecture (SNA) tables.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about the RTPCB table.

**CSGH0003I RTPCB RELOADED FROM FILE**

**Explanation:** This message is displayed when the rapid transport protocol control block (RTPCB) table is loaded again from file during a nonfresh load of the Systems Network Architecture (SNA) tables.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about the RTPCB table.

**CSGI0001I DYNAMIC LOAD OF RVT1/RVT2 COMPLETE**

**Explanation:** A dynamic load of RVT1/RVT2 completed during SNA restart.

**System Action:** None.

**User Response:** None.

**CSGJ0001I HPRMT INITIALIZED**

**Explanation:** This message is displayed during Systems Network Architecture (SNA) restart after the high-performance routing message table (HPRMT) is initialized.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about the HPRMT.

**CSGJ0002I HPRMT CORE COPY REUSED**

**Explanation:** This message is displayed when the core copy of the high-performance routing message table (HPRMT) is valid and used again during a nonfresh load of the Systems Network Architecture (SNA) tables.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about the HPRMT.

**CSGJ0003I HPR OUTPUT MESSAGE DELIVERY NOT GUARANTEED**

**Explanation:** The size of the high-performance routing message table (HPRMT) is 0; therefore, output messages for high-performance routing (HPR) LU-LU sessions will not be saved. If the TPF system is requested to retransmit a message, the rapid transport protocol (RTP) connection will be deactivated.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about RTP connections and the HPRMT.

**CSIO0001E**

**Explanation:** This explanation is for the messages with headers beginning with: CSIO, CINP, COUT, CCTL, CTRM, and CHIO.

Communication line error messages contain a header to indicate the type of operation as follows.

**CSIO** An error on the SIO instruction.

**CINP** An error detected at interrupt time on input operation.

**COUT** An error detected at interrupt time on output operation.

**CCTL** A control operation error.

**CTRM** An external hardware error.

**CHIO** An error on an HIO instruction.

Each header is followed by error information as the following describes.

**HS***xx* CTL SUB*xx* OP*xx error-text*

**LS***xx* FDX TIA*xx error-text*

**AR***xx* HXA TSC*xx error-text*

**AI***xx* HXN TA*xx error-text*

**BS***xx* SOA

**LC***xx* SON

SIA

SIN

The error text is one of the following:

```
CSWxxxxxxxx SNSxx CCx DOWN LOST DATA — DOWN REPEATED
CHARACTER DOWN NEGATIVE ANSWR-BACK DOWN MAIN SIDE DOWN
MONITOR SIDE DOWN SP UP POLL RCVD
```

**Note:** Error data that is not available is printed as *; for example, SNS**.

**Where:**

**HS***xx*
The high-speed symbolic line number.

**LS***xx*
The low-speed symbolic line number (controlled and free-running).

**AR***xx*
The ARINC symbolic line number.

**AI***xx*
The synchronous Link symbolic line number.

**BS***xx*
The binary synchronous communication (BSC) symbolic line number.

**LC***xx*
The local 3270 Line Number.

*CTL*
The controlled line.

*FDX*
The full-duplex (free-running line).

*HXA*
The half-duplex with answerback (Free-running line).

*HXN*
The half-duplex (free-running line).

*SOA*
The simplex-out with answerback (free-running line).

*SON*
The simplex-out (free-running line).

*SIA* The simplex-in with answerback (free-running line).

*SIN*
The simplex-in.

**SUB***xx*
The subchannel number.

**OP***xx*
The operation code in CCW.

**TIA***xx*
The terminal interchange address.

*TSC*
The transmitter start code.

**STA***xx*
The station identification.

**CSW***x..x*
The eight bytes from CSW.

**SNS***xx*
The sense data.

**CC***x*
The condition code resulting from SIO.

*DOWN*
If a line, interchange, or terminal is shut down by the control program.

*SP UP*
If a terminal or interchange is reinstated to normal polling.

Example:

```
14.23.16 COUT HS05 CTL SUB63 OP01
CSW10049DD80E000005 SNS40 CC2 DOWN
```

**System Action:** None.

**User Response:** None.

---

**CSMP0097I CPU-***id* **SS-***ssname* **SSU-***ssuname* **IS-***isnum*

**Where:**

*id* The CPU ID.

*ssname*
The subsystem name.

*ssuname*
The subsystem user (SSU) name.

*isnum*
The I-stream, which is displayed as a decimal number.

**Explanation:** This message precedes all messages in TPF systems that have prefix messaging generated in the TPF system. Prefix messaging is included in the TPF system by specifying YES in the PREMSG parameter to the SIP stage I CONFIG macro. The default is PREMSG=YES.

If the CSMP0097I message is generated on a base-only TPF system, then the subsystem name and SSU name are defined as the character string BASE.

**System Action:** None.

**User Response:** None.

---

**CSMP0098I RESTRICTED MESSAGE ENTERED — TERM. NOT AUTHORIZED**

**Explanation:** The terminal that input the command is not authorized to perform that function.

**System Action:** None.

**User Response:** Do one of the following:

- Authorize the terminal by entering the ZACRS command.
- Enter the command again from an authorized terminal.

See *TPF Operations* for more information about the ZACRS command.

**CSMP0099I LNIATA-CPU-*ID command***

**Where:**

*ID* The central processing unit (CPU) ID.

*command*
The command entered.

**Explanation:** All input is echoed to the appropriate functional support consoles (FSCs), providing a contiguous account of system activity within functional areas.

**Note:** If no loosely coupled TPF system is generated in the TPF system, the CPU ID is omitted.

**System Action:** None.

**User Response:** None.

# CSNA–CTIN

**CSNA0011E REQUIRED BLANK MISSING AFTER ACTION CODE**

**Explanation:** A SNA command was entered that requires a blank following the five-character action code, for example, after ZNETW. The required blank is missing.

**System Action:** None.

**User Response:** Enter the command again with the required blank between the action code and the following message parameters.

See *TPF Operations* for more information about the SNA communication commands.

**CSNA0012E ILLEGAL FUNCTION — NO LINKAGE FOUND**

**Explanation:** A command that is not valid was entered beginning with ZN.

**System Action:** None.

**User Response:** Do the following:

1. Verify the spelling of the action code.
2. Enter the command again with the correct action code.

See *TPF Operations* for more information about the SNA communication commands.

**CSNA0013E I/O HARDWARE ERROR DURING CSN0 SNA MESSAGE TABLE RETRIEVAL**

**Explanation:** A SNA command was entered but an input/output (I/O) error occurred when the SNA command editor CSNA attempted to retrieve the SNA command table (CSN0). The SNA command cannot be processed.

**System Action:** A file error message is sent to the prime computer room agent set (CRAS) console and CSNA is exited.

**User Response:** Do the following:

1. Inform the operator of the prime CRAS console so the operator can check for the file error message.
2. When the hardware problem is corrected, you may enter the command again.

See *TPF Operations* for more information about the SNA communication commands.

**CSNB0001E CURRENT NCB DIRECTORY RECORD, ORDINAL *ordnum* IS FULL**

**Where:**

*ordnum*
The ordinal number of the current node control block (NCB) directory record.

**Explanation:** An NCB record cannot be created for the resource because the specified current NCB directory record is full.

**System Action:** None.

**User Response:** Enter the ZNNCB REORG command to increase the number of NCB directory records in the TPF system.

See *TPF Operations* for more information about the ZNNCB REORG command.

**CSNB0002I CURRENT NCB DIRECTORY RECORD, ORDINAL *ordnum* IS 90 PERCENT FULL**

**Where:**

*ordnum*
The ordinal number of the current node control block (NCB) directory record.

**Explanation:** The TPF system determined that the specified current NCB directory record is becoming full.

**System Action:** The TPF system starts the NCB reconciliation function for the specified current NCB directory record to reclaim the entries that are no longer being used.

**User Response:** Determine if you should reorganize the NCB directory records at this time.

See *TPF ACF/SNA Data Communications Reference* for more information about the NCB reconciliation and NCB reorganization functions.

**CSNB0003E STAGED NCB DIRECTORY RECORD, ORDINAL *ordnum* IS FULL**

**Where:**

*ordnum*
The ordinal number of the staged node control block (NCB) directory record.

**Explanation:** The TPF system tried to create a new NCB record for a resource while the NCB reorganization function was running. However, the NCB record cannot be created for the resource because the specified staged NCB directory record is full.

**System Action:** The NCB reorganization function ends.

**User Response:** Do the following:

1. Increase the number of staged NCB directory records in the TPF system.
2. Enter the ZNNCB REORG command to start the NCB reorganization function again.

See *TPF ACF/SNA Data Communications Reference* for more information about the staged NCB directory records and the NCB reorganization function. See *TPF Operations* for more information about the ZNNCB REORG command.

---

**CSNB0004I STAGED NCB DIRECTORY RECORD, ORDINAL *ordnum* IS 90 PERCENT FULL**

**Where:**

*ordnum*
The ordinal number of the staged node control block (NCB) directory record.

**Explanation:** The TPF system created a new NCB record for a resource while the NCB reorganization function was running and determined that the specified staged NCB directory record is becoming full.

**System Action:** None.

**User Response:** See your system administrator for more information.

See *TPF ACF/SNA Data Communications Reference* for more information about the NCB reconciliation and NCB reorganization functions.

---

**CSNB0005I NCB DATABASE SWITCHED IN THIS PROCESSOR**

**Explanation:** This processor updated the node control block (NCB) database information in its resource name hash control table (RNHCT) because it detected that the NCB database was switched on another processor in the loosely coupled TPF system.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about the RNHCT.

---

**CSON0002I FARF ADDRESS IS *address***

**Where:**

*address*
The 16-digit hexadecimal file address.

**Explanation:** This is the normal response to the ZCSON command. The module, cylinder, head and record (MCHR) address specified in the command is converted and displayed as a file address reference format (FARF) address.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCSON command.

---

**CSON0052E MCHR OUTSIDE SYSTEM LIMITS**

**Explanation:** The ZCSON command was entered, but the module, cylinder, head and record (MCHR) address specified was not converted to a valid file address reference format (FARF) address because it exceeds the defined database range.

**System Action:** The command is rejected.

**User Response:** Enter the ZCSON command again and specify a valid MCHR address.

See *TPF Operations* for more information about the ZCSON command.

---

**CSON0053E INPUT MCHR IS NOT 7-BYTES IN LENGTH**

**Explanation:** A ZCSON command was entered with a module, cylinder, head, and record (MCHR) address specified that was not 14 digits (7 bytes) in length.

**System Action:** The command is rejected.

**User Response:** Enter the ZCSON command again and specify a 14-digit MCHR address.

See *TPF Operations* for more information about the ZCSON command.

---

**CSON0054E INPUT RECORD TYPE IS NOT VALID**

**Explanation:** A ZCSON command was entered with a record type value specified that was not F (for fixed) or P (for pool).

**System Action:** The command is rejected.

**User Response:** Enter the ZCSON command again and specify either F or P for the record type value.

See *TPF Operations* for more information about the ZCSON command.

---

**CSS00001I RCS RESTART STARTED**

**Explanation:** The TPF restart scheduler performed an ENTRC to the record caching subsystem restart program.

**System Action:** The record cache subsystem (RCS) restart program begins processing.

**User Response:** None.

---

**CSS00002I RCS RESTART COMPLETED**

**Explanation:** The record caching subsystem (RCS) restart program performed a BACKC to the TPF restart scheduler.

**System Action:** TPF restart is continued.

**User Response:** None.

---

**CSS00020A ISSUE ZBUFC ALLOCATE INIT MESSAGE TO RE-ESTABLISH CURRENT RECORD SLOT ALLOCATION RATIOS**

**Explanation:** The record slot allocations for the record cache subsystems (RCSs) in the complex were lost. These values are used to verify that the RCSs are initialized properly.

**System Action:** The TPF system waits for you to specify the

proper record slot allocations for the RCSs. After you provide the valid allocations, RCS restart processing is continued.

**User Response:** Enter the ZBUFC ALLOCATE command to respecify record slot allocation ratios for the RCSs in the complex.

See *TPF Operations* for more information about the ZBUFC ALLOCATE command.

---

**CSS00040W RCS SSST HEADER RETRIEVAL ERROR— POTENTIAL DATA LOSS CONDITIONS FOR THIS IPL CAN NOT BE REPORTED**

**Explanation:** The record cache subsystem (RCS) restart program detected a record ID failure while trying to retrieve the subsystem status table (SSST) header record from file. This indicates that:

- The SSST was corrupted or never initialized
- The RCS restart program was unable to identify the RCSs where a conflict existed between the software status and hardware status
- Record slot allocations for the RCSs in the complex were lost. These values are used to verify that the RCSs are initialized properly.

**Note:** This occurs for the first processor in the complex.

**System Action:** the CSS020A message is issued and waits for you to provide the proper record slot allocations for the RCSs in the complex through the ZBUFC ALLOCATE INIT command. The remainder of the SSST is reconstructed using current hardware status.

**User Response:** None.

---

**CSS00041W FAST WRITE DISABLE REQUESTED FOR RCS COMPLEX DUE TO ZBUFC FILE ALL REQUEST — ISSUE ZBUFC ENABLE ALL TO RE-ENABLE**

**Explanation:** A ZBUFC FILE command was entered to destage the record cache subsystem (RCS) cache memories prior to this IPL.

**System Action:** RCS restart processing is continued.

**User Response:** Enter the ZBUFC ENABLE command to re-enable the RCS complex caching operations.

See *TPF Operations* for more information about the ZBUFC commands.

---

**CSS00042W ZBUFC FILE DID NOT COMPLETE ON THIS PROCESSOR**

**Explanation:** An outage occurred on this processor while a ZBUFC FILE command was being processed.

**System Action:** Record cache subsystem (RCS) restart processing is continued.

**User Response:** Enter the ZBUFC FILE command again.

See *TPF Operations* for more information about the ZBUFC FILE command.

---

**CSS00043W ZBUFC ALLOCATE IMPLEMNT RCS DID NOT COMPLETE ON THIS PROCESSOR**

**Explanation:** An outage occurred on this processor while a ZBUFC ALLOCATE IMPLEMNT command was being processed.

**System Action:** Record cache subsystem (RCS) restart processing is continued.

**User Response:** Enter the ZBUFC ALLOCATE IMPLEMNT command again.

See *TPF Operations* for more information about the ZBUFC ALLOCATE IMPLEMNT command.

---

**CSS00044W ZBUFC ENABLE DID NOT COMPLETE ON THIS PROCESSOR**

**Explanation:** An outage occurred on this processor while a ZBUFC ENABLE command was being processed.

**System Action:** Record cache subsystem (RCS) restart processing is continued.

**User Response:** Enter the ZBUFC ENABLE command again.

See *TPF Operations* for more information about the ZBUFC ENABLE command.

---

**CSS00045W ZBUFC FILE FUNCTION PENDING**

**Explanation:** One of the other processors in the loosely coupled complex is processing a ZBUFC FILE command.

**System Action:** Record cache subsystem (RCS) restart processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC FILE command.

---

**CSS00046W ZBUFC ALLOCATE IMPLEMNT RCS FUNCTION PENDING**

**Explanation:** One of the other processors in the loosely coupled complex is processing a ZBUFC ALLOCATE IMPLEMNT command.

**System Action:** Record cache subsystem (RCS) restart processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC ALLOCATE IMPLEMNT command.

---

**CSS00047W ZBUFC ENABLE FUNCTION PENDING**

**Explanation:** One of the other processors in the loosely coupled complex is processing a ZBUFC ENABLE command.

**System Action:** Record cache subsystem (RCS) restart processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZBUFC ENABLE command.

---

**CSS00080T ERROR RETRIEVING RCS SSST — RESTART ABORTED**

**Explanation:** A hardware error or logic error was found while trying to retrieve the subsystem status table (SSST) header record from file.

**Note:** This error occurs on all processors except the first one in the complex.

**System Action:** The TPF restart scheduler is exited.

**User Response:** See your IBM service representative.

**CSS00081T ERROR FILING RCS SSST — RESTART ABORTED**

**Explanation:** A hardware error or logic error was found while trying to write the subsystem status table (SSST) header record to file.

**System Action:** The TPF restart scheduler is exited.

**User Response:** See your IBM service representative.

**CSS00084T FIND ERROR RETRIEVING KEYPOINT 0 — RESTART ABORTED**

**Explanation:** A hardware error or logic error was found while trying to retrieve keypoint 0 from file.

**System Action:** The TPF restart scheduler is exited.

**User Response:** See your IBM service representative.

**CSS10048W NO DASD CONFIGURED ON RCS SSID *ssss* — SUBSYSTEM HAS BEEN REMOVED FROM THE COMPLEX**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** No modules in the MFST were found to be attached to the specified record cache subsystem (RCS)

**System Action:** The subsystem status table (SSST) entry for the specified subsystem is deleted.

**User Response:** None.

**CSS10049W FILE SSST ENTRY CONFLICT DETECTED FOR RCS SSID *ssss* —**

**Where:**

*ssss* Represents a 3990 record cache subsystem (RCS) subsystem ID (SSID).

**Explanation:** An SSID entry was created prior to RCS restart that used a memory subsystem status table (SSST) entry position different than the file copy of the SSST. Symmetry must be maintained between the file and memory copies of the SSST for RCS support to correctly report potential data loss conditions due to configuration changes between IPLs of the TPF system. RCS restart accommodates the configuration change and rebuilds the file SSST at the completion of processing.

**System Action:** The SSST is rebuilt at the end of RCS restart to reflect the configuration change. Potential data loss condition reporting is ended for this IPL.

**User Response:** None.

**CSS10080T ERROR RETRIEVING RCS SSST – RESTART ABORTED**

**Explanation:** A hardware error or logic error was found while trying to retrieve one of the subsystem status table (SSST) records from file.

**System Action:** The TPF restart scheduler is exited.

**User Response:** See your IBM service representative.

**CSS20003I RCS SSID *ssss* HAS BEEN ADDED TO THE COMPLEX**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** During construction of the subsystem status table (SSST), a new RCS SSID was returned in response to a sense subsystem status command.

**System Action:** An entry for this RCS is added to the SSST.

**User Response:** None.

**CSS30050W FOLLOWING MODS HAVE POTENTIAL DATA LOSS FROM CACHE FOR SS *tpf-ss***

**Where:**

*tpf-ss*
Represents a TPF subsystem name.

**Explanation:** The record cache subsystem (RCS) returned from the sense subsystem status command does not agree with the SSID maintained in the MFST entry for one or more DASD attached to the specified record cache subsystems (RCSs) This indicates that a configuration change took place, that is, a group of DASD previously attached to a given RCS was switched to another RCS or another non-RCS controller.

The cache storage for the old RCS may not have been completely destaged before the substitution occurred. Therefore, data in the old subsystem cache may have been lost.

**System Action:** The TPF system issues the RSTT0004A message requesting your permission to write the updated version of the module verification table (MVT) with the updated SSID value for the specified DASD modules.

**User Response:** None.

**CSS30051W POSSIBLE CACHE FAST WRITE DATA LOSS FOR RCS SSID *ssss***

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the cache fast-write ID (CFWID) in the specified RCS subsystem was incremented since the last IPL. This means that any cache fast-write data not written to disk at the time the CFWID was changed may have been lost.

**System Action:** The file-resident subsystem status table

(SSST) entry is refreshed with the new CFWID.

**User Response:** See your IBM service representative.

---

**CSS40085T FACE ERROR RETRIEVING RCS SSST DATA BLOCK — RESTART ABORTED**

**Explanation:** A file address compute program (FACE) error was found during an attempt to retrieve the first subsystem status table (SSST) data block from file for the purpose of rebuilding it.

**System Action:** The TPF restart scheduler is exited.

**User Response:** See your IBM service representative.

---

**CSS60028W NONVOLATILE STORAGE BATTERY DEFECTIVE ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the specified RCS cannot be fully enabled due to a defective nonvolatile storage battery.

**System Action:** RCS restart processing is continued with RCS queue thresholding active for the affected subsystem.

**User Response:** See your IBM service representative.

---

**CSS60029A CACHING TERMINATED ON RCS SSID** *ssss* **DUE TO SUBSYSTEM STORAGE MALFUNCTION**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the specified RCS cannot be fully enabled due to an internal subsystem error condition.

**System Action:** RCS restart processing is continued with RCS queue thresholding active for the affected subsystem.

**User Response:** See your IBM service representative.

---

**CSS60030A DASD FAST WRITE TERMINATED ON RCS SSID** *ssss* **DUE TO NONVOLATILE STORAGE MALFUNCTION**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the specified RCS cannot be fully enabled due to an internal nonvolatile storage error condition.

**System Action:** RCS restart processing is continued with RCS queue thresholding active for the affected subsystem.

**User Response:** See your IBM service representative.

---

**CSS60052W SUBSYSTEM STATUS CONFLICT ON RCS SSID** *ssss* **— SUBSYSTEM NOT DISABLED FOR FAST WRITE FUNCTIONS**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A conflict exists between the hardware status for a particular RCS and the software status in the subsystem status table (SSST) entry for the subsystem. The software status indicates that the subsystem was destaged through a previous ZBUFC FILE request. However, the hardware status indicates that fast-write functions are still active.

**System Action:** None.

**User Response:** Enter the ZBUFC FILE command again, if required.

See *TPF Operations* for more information about the ZBUFC FILE command.

---

**CSS60053W CACHING DEACTIVATED ON RCS SSID** *ssss* **DUE TO EXPLICIT HOST REQUEST**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the specified RCS is not fully enabled due to a host request to end caching.

**System Action:** RCS restart processing is continued with RCS queue thresholding active for the affected subsystem.

**User Response:** Enter the ZBUFC ENABLE command to re-enable the RCS subsystem for caching, if required.

See *TPF Operations* for more informationa bout the ZBUFC ENABLE command.

---

**CSS60054W CACHE FAST WRITE DEACTIVATED ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the specified RCS is not fully enabled due to termination of the cache fast-write function.

**System Action:** RCS restart processing is continued with RCS queue thresholding active for the affected subsystem.

**User Response:** Enter the ZBUFC ENABLE command to re-enable the RCS subsystem for cache fast-write functions, if required.

See *TPF Operations* for more information about the ZBUFC ENABLE command.

---

**CSS60055W NONVOLATILE STORAGE DEACTIVATED ON RCS SSID** *ssss* **DUE TO EXPLICIT HOST REQUEST**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the

specified RCS is not fully enabled due to a host request to end use of nonvolatile cache capability.

**System Action:** RCS restart processing is continued with RCS queue thresholding active for the affected subsystem.

**User Response:** Enter the ZBUFC ENABLE command to re-enable the RCS subsystem for DASD fast-write capability, if required.

See *TPF Operations* for more information about the ZBUFC ENABLE command.

---

**CSS60056W ALLOCATION RATIOS NOT CURRENT FOR RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The record slot allocation ratios for the specified RCS do not match those designated for the RCS complex in the subsystem status table (SSST) header. This message is generated by the RCS restart program if the executing processor is not the first processor in the loosely coupled configuration.

**System Action:** None.

**User Response:** Enter the ZBUFC ALLOCATE command with the IMPLEMNT parameter specified to reset the allocation ratios to the desired values.

See *TPF Operations* for more information about the ZBUFC ALLOCATE command.

---

**CSS60057W FAST WRITE DISABLE REQUESTED FOR RCS SSID** *ssss* **DUE TO ZBUFC FILE REQUEST — ISSUE ZBUFC ENABLE TO RE-ENABLE**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A ZBUFC FILE command was entered to destage the specified record cache subsystem (RCS) prior to this IPL.

**System Action:** RCS restart processing is continued.

**User Response:** Enter the ZBUFC ENABLE command to re-enable caching operations, if desired.

See *TPF Operations* for more information about the ZBUFC ENABLE command.

---

**CSS60058W CACHING DEACTIVATED FOR DEVICE** *dddd* **RCS SSID** *ssss*

**Where:**

*dddd*
Represents a 3990 Record Cache Subsystem (RCS) device address.

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the specified RCS is not fully enabled because caching functions for the device specified in the message were ended.

**System Action:** RCS restart processing is continued with RCS queue thresholding active for the affected subsystem.

**User Response:** Enter the ZBUFC ENABLE command to re-enable the device for caching functions, if required.

See *TPF Operations* for more information about the ZBUFC ENABLE command.

---

**CSS60059W DASD FAST WRITE DEACTIVATED FOR DEVICE** *dddd* **RCS SSID** *ssss*

**Where:**

*dddd*
Represents a 3990 Record Cache Subsystem (RCS) device address.

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the specified RCS is not fully enabled because DASD fast-write functions for the device specified in the message were ended.

**System Action:** RCS restart processing is continued with RCS queue thresholding active for the affected subsystem.

**User Response:** Enter the ZBUFC ENABLE command to re-enable the device for DASD fast-write capability, if required.

See *TPF Operations* for more information about the ZBUFC ENABLE command.

---

**CSS60060W RECORD MODE DISALLOWED FOR DEVICE** *dddd* **RCS SSID** *ssss*

**Where:**

*dddd*
Represents a 3990 Record Cache Subsystem (RCS) device address.

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the specified RCS is not fully enabled since the device specified in the message is not allowed to perform record mode operations.

**System Action:** RCS restart processing is continued with RCS queue thresholding active for the affected subsystem.

**User Response:** Enter the ZBUFC ENABLE command to re-enable the device for record mode operations, if required.

See *TPF Operations* for more information about the ZBUFC ENABLE command.

---

**CSS60061W CACHING DEACTIVATION FAILURE ON RCS SSID** *ssss* **— DESTAGE FAILED**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the specified RCS could not be fully enabled since a prior deactivation request failed. Pinned fast-write data may be present in the subsystem.

**System Action:** RCS restart processing is continued with RCS queue thresholding active for the affected subsystem.

**User Response:** Do the following:

1. Perform the necessary steps to clear any pinned data conditions.
2. Request the deactivation again, if required.

---

**CSS60062W SUBSYSTEM STORAGE DISABLED FOR MAINTENANCE ON SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the specified RCS cannot be fully enabled.

**System Action:** None.

**User Response:** See your IBM service representative.

---

**CSS60063W IML DEVICE NOT AVAILABLE ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the initial machine load (IML) device is not available on the specified record cache subsystem (RCS).

**System Action:** None.

**User Response:** See your IBM service representative.

---

**CSS60064W NONVOLATILE STORAGE DISABLED FOR MAINTENANCE ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the specified RCS cannot be fully enabled.

**System Action:** None.

**User Response:** See your IBM service representative.

---

**CSS60065W NONVOLATILE STORAGE DEACTIVATION FAILURE ON RCS SSID** *ssss* **— DESTAGE FAILED**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the specified RCS cannot be fully enabled since a prior deactivation request failed. Pinned fast-write data may be present in the subsystem.

**System Action:** RCS restart processing is continued with RCS queue thresholding active for the affected subsystem.

**User Response:** Perform steps necessary to clear any pinned data conditions and request deactivation again if required.

---

**CSS60066W DEACTIVATE PENDING FOR DEVICE** *dddd* **RCS SSID** *ssss* **UNABLE TO TRANSFER MODIFIED DATA TO DISK**

**Where:**

*dddd*
Represents a 3990 Record Cache Subsystem (RCS) device address.

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the specified RCS could not be fully enabled since a prior deactivation request failed. Pinned fast-write data may be present in the subsystem.

**System Action:** RCS restart processing is continued with RCS queue thresholding active for the affected subsystem.

**User Response:** Do the following:

1. Perform the necessary steps to clear any pinned data conditions.
2. Request the deactivation again, if required.

---

**CSS60067W DASD FAST WRITE DEACTIVATE PENDING FOR DEVICE** *dddd* **RCS SSID** *ssss* **UNABLE TO TRANSFER MODIFIED DATA TO DISK**

**Where:**

*dddd*
Represents a 3990 Record Cache Subsystem (RCS) device address.

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the specified RCS could not be fully enabled since a prior deactivation request failed. Pinned fast-write data may be present in the subsystem.

**System Action:** RCS restart processing is continued with RCS queue thresholding active for the affected subsystem.

**User Response:** Do the following:

1. Perform the necessary steps to clear any pinned data conditions.
2. Request the deactivation again, if required.

---

**CSS60068W FAST WRITE FUNCTIONS SUSPENDED ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The RCS restart program determined that the specified RCS is not fully enabled because fast-write functions are suspended in the subsystem.

**System Action:** RCS restart processing is continued with RCS queue thresholding active for the affected subsystem.

**User Response:** Enter the ZBUFC ENABLE command to the affected RCS subsystem to resume fast-write operations.

See *TPF Operations* for more information about the ZBUFC ENABLE command.

**CSS60083W UNRECOGNIZED ALLOCATIONS FOR RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** The record slot allocation ratios for the specified RCS do not match those designated for the RCS complex in the subsystem status table (SSST) header.

**System Action:** None.

**User Response:** Enter the ZBUFC ALLOCATE command with the IMPLEMNT parameter specified to reset the slot allocation ratios to the desired values.

See *TPF Operations* for more information about the ZBUFC ALLOCATE command.

**CS060001W PIU TRACE QUESCING. MAXIMUM TAPE QUEUE DEPTH EXCEEDED.**

**Explanation:** The number of items currently in the real-time tape queue exceeds the value allowed for the path information unit (PIU) trace facility. This value is set through the PIUTAPEQ parameter in the SNAKEY macro and is displayed by entering the ZNKEY command.

The maximum tape queue value is 255.

**System Action:** The path information unit (PIU) trace facility temporarily stops writing to tape.

**User Response:** Do the following:

1. Determine why the real-time tape queue is full. For example, another utility may be writing to the real-time tape or a dump may have occurred.
2. Do one of the following:
   - Change the value of the PIUTAPEQ parameter by entering the ZNKEY command.
   - Correct other errors.

See *TPF Operations* for more information about the ZNKEY command. See *TPF ACF/SNA Data Communications Reference* for more information.

**CTIN0004E PROGRAM CHECK IN INITIALIZATION — ABORTED**

**Explanation:** A program check occurred in CCCTIN. An attempt is made to display the contents of the general registers and program old PSW.

**System Action:** The TPF system is put into disabled wait state immediately.

If the program check occurred in either the dump routine or the system console write routine, no attempt is made to issue an error message or to display the registers and program old PSW.

**User Response:** Do the following:

1. Determine why the program check occurred.
2. Correct the error.
3. IPL the TPF system again.

**CTIN0008E --INVALID CPU ID — CTIN ABORTED**

**Explanation:** This may be a hardware error. The CPU model number read from the machine could not be found in the CPU ID table. A loop timing adjustment factor is adjusted depending on the CPU model. After entering this error message, the content of the general registers are displayed along with the program old PSW.

The CPU information is required for the TPF system to run.

**System Action:** The TPF system is put into disabled wait state immediately.

**User Response:** Do the following:

1. Ensure the CPU model number is in the CPU ID table.
2. Correct the error.
3. IPL the TPF system again.

**CTIN0010E CCCPSE STORAGE NOT VEQR — CTIN ABORTED**

**Explanation:** Due to TPF system changes, a hardware page in low memory is not mapped V=R.

**System Action:** The initializer ends. CCCPSE must reside in V=R storage.

**User Response:** Do the following:

1. Determine the cause of the hardware failure.
2. Correct the error.

**CTIN0012I CT00 INIT STARTED**

**Explanation:** The CT00 copy member completed successfully. The global areas were carved out and the pointers to the global areas were set up. The CINFC tables were carved out and several CINFC slots were filled in. The following information was moved to their permanent core location:

- The subsystem attribute table
- The subsystem user table
- Keypoint X.

The message counter areas for data collection were carved out.

**System Action:** Initialization is continued.

**User Response:** None.

**CTIN0013I STIMER TABLE INIT DONE / CPU TIMER STARTED**

**Explanation:** The system timer table was carved and initialized. The CPU timer is now active.

**System Action:** Initialization is continued.

**User Response:** None.

**CTIN0014I CT01 TAPE TABLES ALLOCATED AND TSTB INIT**

**Explanation:** the CT01 copy member CT01 completed successfully.

The CREATE macro controls were initialized. Several PSWs were set up. The start of working storage was determined.

Keypoint B, keypoint 9, and keypoint M were moved to their permanent core locations. The tape status table was initialized. The tape control unit cross reference table was carved out. The general file volume serial number (VSN) table was moved to its permanent core location.

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0015I INTERNAL EVENT FACILITY TABLE INIT DONE**

**Explanation:** A call was made to the CP CCCIEF segment to carve out and initialize the internal event facility table.

**System Action:** The call completed successfully.

**User Response:** None.

---

**CTIN0016I CT05 SON MFST & RCS TABLE INIT DONE**

**Explanation:** The CT05 copy member completed successfully. The DASD control tables were initialized and table address pointers setup. These tables include:

- Control unit status table (CST)
- Module cross reference table (XRT)
- Module file status table (MFST)
- Record cache subsystem (RCS) status table (SSST)
- Record cache subsystem (RCS) asynchronous event table (AET).

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0017E KEYPOINT ADDRESS ERROR — CTIN ABORTED**

**Explanation:** A file address compute program (FACE) error occurred while generating keypoint addresses.

**System Action:** CTIN is aborted.

**User Response:** To IPL this image, a new FACE table, a new CTKX record, or both should be loaded.

See *TPF Main Supervisor Reference* for more information.

---

**CTIN0018I CT08 MPIF TABLE CREATION COMPLETE**

**Explanation:** The Multi-Processor Interconnect Facility (MPIF) tables were carved out successfully. Pointers to the tables were stored into the Multi-Processor Interconnect Facility global table (MGT). (The DSECT name for the MGT is DCTMGT.)

**System Action:** CTIN processing is continued.

**User Response:** None.

---

**CTIN0019I CT09 COMMIT/ROLLBACK ALLOCATION COMPLETE**

**Explanation:** The CT09 copy member completed successfully. In addition, the areas required for TPF transaction services control tables and the recovery log buffer were allocated.

**System Action:** Initialization continues.

**User Response:** None.

---

**CTIN0020I CT10 SON POOL CARVE COMPLETE**

**Explanation:** The CT10 copy member completed successfully. The pool management global table and CINFC table pool entries were initialized and storage was allocated for the pool directory set control areas.

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0024I CT15 SNA TABLE ALLOCATION COMPLETE**

**Explanation:** The CT15 copy member completed successfully. In addition, the following occurred:

- If the fast recovery table was not saved over the last IPL, it was carved out again.
- The SNA parameter list was carved out and some of its fields were initialized.
- The resource vector table (RVT) was carved out.
- The subarea address table (SAT) was carved out.
- The network address table (NAT) was carved out and a few of its fields have been initialized.
- The system recovery table (SRT) was carved out.

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0025I CT15 WGTA ALLOCATION COMPLETE**

**Explanation:** The CT15 copy member completed successfully. The WGTA was carved out.

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0028I CT20 STORAGE RESERVED FOR CCP TABLES**

**Explanation:** The CT20 copy member completed successfully. In addition, the following occurred:

- The ECB initialization constant for the CPU ID field were set up.
- The CCP configuration record was initialized.
- Keypoint D was moved to its permanent location.
- The terminal interchange status table was carved out and initialized.
- The address for keypoint C was put in CTKX and the CINFC tables, and it was moved to its permanent core location.
- The routing control application table (RCAT) pointers were put into the CINFC table.
- The basic subsystem (BSS) user table slot address was put into the dummy routing control application table (RCAT).
- The line status table was initialized.
- The branch vector table (BVT) and the poll status table (PSTB) were carved out and initialized.
- The symbolic line status table was carved out.

- The control unit keypoint record and the control unit interrupt pointer table were carved out.
- The random number table was carved out.
- The station name conversion table (SNCT) was carved out.
- The binary synchronous communication (BSC) station addressing table (BSAT) was carved out.
- The application name table (ANT) was carved out.
- The WTOPC Message Assembly Table (MAT) was carved out.

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0030I CT25/CT26 USER EXIT ACTIVATED**

**Explanation:** The CT25 and CT26 copy members completed successfully. The CT25 copy member allows you to reserve storage for user tables or other unique structures that require reserved main storage. The CT26 copy member allocates storage for user storage resident tables through the use of the data supplied in the user storage allocation table (USAT) that is built by the CT25 copy member.

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0036I CT40 CLH TABLES AND STORAGE BLOCKS BUILT**

**Explanation:** The CT40 copy member completed successfully. The CT40 copy member carves out storage for the PNL table, the detached block table, all of the working storage blocks and their control structures, the ECB virtual memory (EVM) page and segment tables, the dispatch management table, the dispatch control record, and the dispatch control list.

If there is not enough working storage to satisfy all the block requests, the number of each type of block allocated is bumped down. A message warning you that there was not enough working storage is issued later in the IPL.

The maximum and minimum shutdown levels for the CPU loop are calculated, the Enter/Back nesting levels are determined, and the working storage protect keys are set.

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0037I CT38 STACKS ALLOCATED**

**Explanation:** The CT38 copy member completed successfully. The CT38 copy member carves out storage for:

- The synchronous link control (SLC) input and output link queues
- Standard linkage stacks
- The machine check stack
- Core resident program areas
- The program allocation HASH table
- The program allocation table (PAT)
- The extra PAT slot area
- E-type loader tables
- System virtual memory (SVM) page and segment tables
- System log tables
- Trace output buffers
- The dynamic override bitmap table (DOBT)
- TPF C language work area (LWA) blocks.

The CT38 copy member also sets the storage protect keys from the end of the global area to the end of the SVM.

**System Action:** Initialization is continued.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information about the system initializer (CCCTIN).

---

**CTIN0038I CT41 MISCELLANEOUS TABLES BUILT**

**Explanation:** The CT41 copy member completed successfully. The CT41 copy member accomplishes the following:

- The time-of-day (TOD) clock comparator and the CPU timer are set to their maximum values.
- The starting address of virtual file access (VFA) is set up.
- The storage key is set for the control program, application area, global area, and keypoint and control program tables.
- The clock tables are initialized.
- The WGTA entries for the system console and printer are initialized.

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0040I CT50 VFA INIT DONE**

**Explanation:** The CT50 copy member completed successfully. Pointers to virtual file access (VFA) areas were set up in the CINFC table, the dump formatter label table, and low core.

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0044I CT60 CCP TABLE INIT DONE**

**Explanation:** The CT60 copy member completed successfully. In addition, the following occurred:

- The internal line number table was initialized to zeroes.
- The symbolic line status table was initialized.
- The prime computer room agent set (CRAS) and the receive-only (RO) entries in the internal line table and the branch vector table were set up.
- CCWs were built.
- The control unit keypoint status record (PKST) pointer table was initialized.

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0048I CT65 UNIT RECORD DEVICE TABLE INIT DONE**

**Explanation:** The CT65 copy member completed successfully. If there are unit record devices in the TPF system, the unit record device status table is initialized from data in keypoint

B. The entries in the branch vector table that correspond to unit record devices are initialized.

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0052I CT66 3705 CONTROL TABLE INIT DONE**

**Explanation:** The CT66 copy member completed successfully. The CCW pointer table was initialized for the IBM 3705.

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0058I CT81 MACHINE CHECK INITIALIZATION COMPLETE**

**Explanation:** The CT81 copy member completed successfully.

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0059I CT85 I-STREAM INITIALIZATION COMPLETE**

**Explanation:** The CT85 copy member completed successfully.

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0060I INIT COMPLETE — CTIN CALLING ACPL**

**Explanation:** This message is issued upon completion of CCCTIN when IPLing from a general file. Control is then passed to ACPL.

**System Action:** Initialization is continued.

**User Response:** None.

---

**CTIN0064I INIT COMPLETE — CTIN CALLING RESTART**

**Explanation:** This message is issued upon completion of CCCTIN when IPLing from an online module. Control is then passed to the CTKS segment to begin restart.

**System Action:** Initialization is completed and restart is started.

**User Response:** None.

---

**CTIN0068E CT00 SS KEYPOINTS OVERLAID — CTIN ABORTED**

**Explanation:** IPLB passes the core address of the beginning of the keypoints to CCCTIN. Upon return from the CT00, CT01, CT05, CT10, CT15, and CT20 copy members and also upon return from carving out the internal event facility table, a check is made to ensure that the keypoints are not overlaid. This error message indicates that one of those times it was discovered that the keypoints were overlaid.

After the error message is issued, the content of the general registers are displayed along with the program old PSW, followed by the TPF system entering disabled wait state.

**System Action:** The TPF system is put into disabled wait state immediately.

**User Response:** None.

---

**CTIN0072E CT00 GLOBAL AREA TOO LARGE — CTIN ABORTED**

**Explanation:** There is too much global area reserved. The TPF system cannot run under that circumstance.

The CT00 global area sums up the number of 2K blocks requested for each of the global areas (Global 1 (A), Global 2, Global 3 (Y), and Global 4) given as input to the SIP GLOBAL macro, over all subsystem users (SSUs) for all subsystems.

This gives the total size of each of the global areas in terms of the number of 2K blocks. The number of 2K blocks for each of the global areas must be less than or equal to 255. If the number is greater than 255, this error message is issued. The error message is followed by a display of the general registers and the program old PSW.

**System Action:** The TPF system is put into disabled wait state immediately.

**User Response:** Do the following:

1. Reallocate the global areas.
2. Reload the corrected TPF system.
3. IPL the TPF system again.

---

**CTIN0082E CT00 INSUFFICIENT STORAGE FOR** *xxxx*

**Where:**

*xxxx*
The name of the particular table requiring storage.

**Explanation:** While carving storage for the table specified in the message, insufficient storage was detected.

**System Action:** The TPF system is put into disabled wait state immediately except for the CRTB table. The first instance of this message indicates that there is not enough storage to allocate to the TPF transaction services table area. The CT09 segment will reduce the amount of storage to the minimum size and repeat the allocation request. If the second allocation request fails, the TPF system is put into disabled wait state immediately.

**User Response:** Do the following if the TPF system is put into disabled wait state:

1. Define more storage or make some other tables smaller.
2. IPL the TPF system again.

If the specified table is CRTB, the first instance of this message indicates that the TPF transaction services buffer allocation, which is defined in CTKA, is too large.

1. Enter the ZCTKA ALTER command and specify the RLBUF parameter to modify the number of recovery log buffers allocated.
2. IPL the TPF system again.

See *TPF Operations* for more information about the ZCTKA ALTER command.

---

**CTIN0090E CT09 FACE ERROR ALLOCATION CRTB - CTIN ABORTED**

**Explanation:** The CT09 copy member received an error return from the file address compute program (FACE) when retrieving information about the recovery log records.

**System Action:** Initialization ends abnormally.

**User Response:** Determine the reason for the FACE failure and correct it.

**CTIN0092E CT38 FACE ERROR BUILDING PAT — CTIN ABORTED**

**Explanation:** While building the program allocation table (PAT), CTIN found a file address compute program (FACE) error. The registers at the return of the FACE call are displayed.

**System Action:** The TPF system needs the PAT table to run. The TPF system is put into a disabled wait state.

**User Response:** Do the following:

1. Correct the FACE error.
2. Load the new FACE table.
3. Perform an initial program load (IPL) of the TPF system again.

**CTIN0099I CT99 USER EXIT ACTIVATED**

**Explanation:** The CT99 copy member completed successfully. The CT99 copy member allows you to key protect and initialize storage that was allocated using the CT25 and CT26 copy members. The CT99 copy member can also be used to initialize user-defined CINFC values.

**System Action:** Initialization is continued.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information about the system initializer (CCCTIN). Also see *TPF General Macros* for more information about the CINFC macro.

# CTKA–CTSX

**CTKA0017I STORAGE ALLOCATIONS**

**Explanation:** This is the normal response to the ZCTKA ALTER command.

**System Action:** Keypoint A (CTKA) is updated to reflect the modified values.

**User Response:** None.

See *TPF Operations* for more information about the ZCTKA ALTER command and for an example of the informational display.

**CTKA0018I STORAGE ALLOCATIONS**

**Explanation:** This is the normal response to the ZCTKA DISPLAY command. Depending on the parameters that you specified, the current storage, the control program table allocation values, and the timeout value for a stalled tape module queue are displayed.

**System Action:** The TPF system retrieves keypoint A (CTKA) and builds the informational display.

**User Response:** None.

See *TPF Operations* for more information about the ZCTKA DISPLAY command and for an example of the informational display.

**CTKA0050E INVALID INPUT MESSAGE**

**Explanation:** The format of the ZCTKA command is not valid.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format of the ZCTKA command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZCTKA commands.

**CTKA0051E CTKA RETRIEVAL ERROR-MSG IGNORED**

**Explanation:** There was a CTKA retrieval error, so the ZCTKA command was ignored.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCTKA commands.

**CTKA0052E INVALID STORAGE ALLOCATION VALUE**

**Explanation:** A storage allocation value that is not valid was specified when the ZCTKA command was entered.

**System Action:** None.

**User Response:** Enter the ZCTKA command again using a storage allocation value that is valid.

See *TPF Operations* for more information about the ZCTKA commands.

**CTKA0053E *kkkkk* STORAGE ALLOCATION VALUE CAN ONLY BE ALTERED FROM THE BSS**

**Where:**

*kkkkk*
The storage allocation value.

**Explanation:** The ZCTKA ALTER command, which is used to alter the storage allocation value, must be entered from the basic subsystem (BSS).

**System Action:** The storage allocation value is not altered.

**User Response:** Enter the command again from the BSS.

See *TPF Operations* for more information about the ZCTKA ALTER command.

**CTKA0054E ZCTKA ALTER, KEYWORD PARAMETER REQUIRED**

**Explanation:** At least one keyword parameter must be specified with the ZCTKA ALTER command.

**System Action:** No storage allocation values are altered.

**User Response:** Enter the ZCTKA ALTER command again being sure to specify at least one keyword parameter.

See *TPF Operations* for more information about the ZCTKA ALTER command.

**CTKA0056E KEYPOINTING INHIBITED**

**Explanation:** CLHO issues this message to inform you that keypointing is inhibited. Therefore, any changes you make by entering the ZCTKA ALTER command do not take affect.

If a restore is taking place when the ZCTKA ALTER command is entered, keypointing is inhibited until the restore function is completed.

**System Action:** The file copy of the keypoints are not updated.

**User Response:** Enter theZCTKA ALTER command again when keypointing is no longer inhibited, for example, when the restore function is completed.

See *TPF Operations* for more information about the ZCTKA ALTER command.

**CTKA0057E MAXIMUM VALUE FOR TIMEOUT VALUE EXCEEDED**

**Explanation:** The acceptable maximum value for the stalled tape module queue timeout value (TAPQTIME) was exceeded. The maximum value is 255.

**System Action:** The timeout value is not altered.

**User Response:** Enter the ZCTKA ALTER command again, being sure to specify a value that is less than or equal to the maximum value allowed.

See *TPF Operations* for more information about the ZCTKA ALTER command.

**CTKA0058E TAPE VALUE CAN ONLY BE DISPLAYED/ALTERED FROM THE BSS**

**Explanation:** The ZCTKA DISPLAY or ZCTKA ALTER command, which is used to display or alter the stalled tape module queue timeout value, must be entered from the basic subsystem (BSS).

**System Action:** The timeout value is not altered or displayed.

**User Response:** Enter the command again from the BSS.

See *TPF Operations* for more information about the ZCTKA commands.

**CTKA0059E HEAP VALUES CAN ONLY BE DISPLAYED/ALTERED FROM THE BSS**

**Explanation:** The ZCTKA DISPLAY or ZCTKA ALTER command must be entered from the basic subsystem (BSS).

**System Action:** The heap values are not changed or displayed.

**User Response:** Enter the command again from the BSS.

See *TPF Operations* for more information about the ZCTKA commands.

**CTKA0060I MINIMUM VALUE FOR RLBUF IS -** *value*

**Where:**

*value*
The minimum value allowed for the RLBUF parameter of the ZCTKA ALTER command.

**Explanation:** The value specified for the RLBUF parameter of the ZCTKA ALTER command is lower than the minimum allowed value.

**System Action:** The minimum value is used and the requested value is ignored.

**User Response:** Do one of the following:

- If you want to use the minimum value, there is no more action for you to take.
- If you want to change the value, enter the ZCTKA ALTER command again specifying a value for the RLBUF parameter that is larger than the minimum value.

See *TPF Operations* for more information about the ZCTKA ALTER command.

**CTKA0065E THREAD VALUES CAN ONLY BE DISPLAYED/ALTERED FROM THE BSS**

**Explanation:** The ZCTKA ALTER or ZCTKA DISPLAY command was entered from a subsystem other than the basic subsystem (BSS).

**System Action:** The thread values are not changed or displayed.

**User Response:** Enter the command again from the BSS.

See *TPF Operations* for more information about the ZCTKA ALTER and ZCTKA DISPLAY commands.

**CTKA0066E TSTK VALUE MUST BE BETWEEN 4 AND 1024 AND MUST BE A POWER OF 2**

**Explanation:** The ZCTKA ALTER command was entered with a value specified for the TSTK parameter that is not valid. For the TSTK parameter to have a meaningful value the MTHD parameter value must be greater than zero.

**System Action:** The ZCTKA ALTER command is rejected.

**User Response:** Enter the ZCTKA ALTER command again and specify a valid value.

See *TPF Operations* for more information about the ZCTKA ALTER command.

**CTKA0067E TSTK VALUE MUST BE SET TO ENABLE THREADS**

**Explanation:** The ZCTKA ALTER command was entered with a value specified for the MTHD parameter that is not valid because the value of the TSTK parameter is zero. If the value

specified for the MTHD parameter of the ZCTKA ALTER command is greater than zero to enable threads, the threads stack size, which is set by the value of the TSTK parameter, must also be greater than zero. The value of the TSTK parameter can be set before or at the same time as the value for the MTHD parameter.

**System Action:** The ZCTKA ALTER command is rejected.

**User Response:** Enter the ZCTKA ALTER command again and specify a valid value for the TSTK and MTHD parameters.

See *TPF Operations* for more information about the ZCTKA ALTER command.

---

**CTKA0068E TSTK VALUE MUST BE LESS THAN THE MAXIMUM SIZE OF THE ISO-C STACK (ESPS)**

**Explanation:** The ZCTKA ALTER command was entered with a value specified for the TSTK parameter that is too large. The ISO-C stack size for a thread entry control block (ECB) that is set by the TSTK parameter cannot be greater than the maximum size of the ISO-C stack set by the ESPS parameter.

**System Action:** The ZCTKA ALTER command is rejected.

**User Response:** Enter the ZCTKA ALTER command again and specify a valid value.

See *TPF Operations* for more information about the ZCTKA ALTER command.

---

**CTKO0001W GFS DATA WILL BE LOST IF RTA IS NOT MOUNTED**

**Explanation:** The TPF system detected that an active primary real-time (RTA) tape is not mounted or if mounted, it is closed or offline. This message warns you that TPF system data will be lost if an active RTA is not available.

**System Action:** The TPF system restart is continued.

**User Response:** Take the appropriate actions to make an active RTA tape available to the TPF system.

---

**CTKS0001I IPL TO SYNC PROC**

**Explanation:** A software IPL is issued to synchronize this processor, which was previously inactive, with other processors in the loosely coupled complex. This ensures that changes made to the database by other processors between the time this processor is IPLed and the interprocessor communication (IPC) is established are not lost.

**System Action:** None.

**User Response:** None.

---

**CTKS0002E SEG *xxxx* NOT AVAIL — SS DISABLED**

**Where:**

*xxxx*
The program segment name.

**Explanation:** The segment specified in the message is not defined in the record for the subsystem.

**System Action:** The subsystem state change is disabled and restart processing is continued.

**User Response:** See your system programmer before cycling the TPF system above 1052 state.

---

**CTL00004E THIS SUBSYSTEM MUST BE IN 1052 STATE IN ALL PROCESSORS**

**Explanation:** The subsystem must be in 1052 state to do an auxiliary load.

**System Action:** None.

**User Response:** Do the following:

1. Cycle the subsystem to 1052 state.
2. Enter the command again.

---

**CTL00005E SUBSYSTEM ID INVALID**

**Explanation:** The subsystem prefix is not valid.

**System Action:** None.

**User Response:** Enter the command again with the correct subsystem prefix.

---

**CTL00006E SUBSYSTEM NOT AVAILABLE**

**Explanation:** The subsystem is not available on this TPF system.

**System Action:** None.

**User Response:** Do the following:

1. Validate the subsystem prefix.
2. Make sure that the subsystem was initialized.

---

**CTL00007E INVALID INPUT MESSAGE, MUST BE ENTERED AS ZTPLD**

**Explanation:** There are no parameters associated with the ZTPLD command. Therefore, there should not be any characters following ZTPLD (not even blanks are allowed). The end of message character must immediately follow the ZTPLD command.

**System Action:** None.

**User Response:** Enter the ZTPLD command again.

See *TPF System Installation Support Reference* for more information about loaders. See *TPF Operations* for more information about the ZTPLD command.

---

**CTL10001I *nnnnn* — AP PROGRAMS LOADED**

**Where:**

*nnnnn*
The number of programs loaded.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60001T CTKA FIND ERROR**

**Explanation:** There was an error while retrieving keypoint A from the file.

**System Action:** None.

**User Response:** See your system programmer for more information.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60002T RESTART CHAIN INVALID**

**Explanation:** The restart chain addresses that are specified in keypoint X are not valid.

**System Action:** None.

**User Response:** Do the following:

1. Make sure that if keypoint X is being loaded the restart chain addresses are fine.
2. Try the load again.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60003T NO CMFCAD1 ADDR**

**Explanation:** There is no CMFCAD1 address.

**System Action:** None.

**User Response:** See your system programmer for more information.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60004T NO MORE RESTART AREA DEVICE TYPES**

**Explanation:** The auxiliary loader is trying to write beyond the last allocated core image restart area device.

**System Action:** None.

**User Response:** See your system programmer for more information.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60005T TAPE READ ERROR — SUD *xx***

**Where:**

*xx* The structural unit descriptor.

**Explanation:** There was an error reading the TLD tape.

**System Action:** None.

**User Response:** Do the following:

1. Try the load again.
2. Recreate the TLD tape, if errors still occur.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60006T TAPE DIRECTORY ERROR**

**Explanation:** There was an error in the directory record on the TLD tape.

**System Action:**

**User Response:** See your system programmer for more information.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60007T *xxxxxx* — CORE ADDR BELOW RESTART**

**Where:**

*xxxxxx*
The allocated address for the main storage resident program.

**Explanation:** The allocated address for the main storage resident program specified in the message is below the restart AP chain address limit.

**System Action:** None.

**User Response:** See your system programmer for more information.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60008T *xxxxxx* — CORE ADDR ABOVE RESTART**

**Where:**

*xxxxxx*
The allocated address for the main storage resident program

**Explanation:** The allocated address for the main storage resident program specified in the message is above the restart AP chain address limit.

**System Action:** None.

**User Response:** See your system programmer for more information.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60009T ERROR CALCULATING DUP MOD NUMBER**

**Explanation:** There was an error from the FSTIC macro while calculating the duplicate module number.

**System Action:** None.

**User Response:** See your system programmer for more information.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60010T FIND/FILE ERROR FOR C.I. BLOCK**

**Explanation:** A fine or file error was found while processing a restart area record.

**System Action:** None.

**User Response:** See your system programmer for more information.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60011T** *nnnnnnnn* **— BAD COMPUTED C.I. ADDR**

**Where:**

*nnnnnnnn*
The computed file address.

**Explanation:** The computed file address specified in the message for a restart area block is not correct.

**System Action:** None.

**User Response:** See your system programmer for more information.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60012T** *xxxx* **NOT IN KEYPOINT TABLE**

**Where:**

*xxxx*
The keypoint.

**Explanation:** The keypoint on the TLD tape does not have an entry in the keypoint table.

**System Action:** None.

**User Response:** Notify coverage programmer.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60013T**

**Explanation:** A find or file error was found while processing the keypoint specified in the message.

**System Action:** None.

**User Response:** Do the following:

1. Try the load again.
2. See your system program if the message occurs again.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60015T** *xxxx* **— RESTART CHAIN OVERFLOW**

**Where:**

*xxxx*
The segment.

**Explanation:** The segment specified in the message did not fit in its restart area.

**System Action:** None.

**User Response:** See your system programmer for more information.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60016T FILNC ERROR FOR FR PGM — SUD** *xx*

**Explanation:** FILNC found an error while trying to file a file-resident program.

**System Action:** None.

**User Response:** Do the following:

1. Try the load again.
2. See your system program if the message occurs again.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60018T ERROR ON CROSC TO CZU1**

**Explanation:** The TPF system could not CROSC to CZU1 to convert the file address for the keypoint being loaded.

**System Action:** None.

**User Response:** See your system programmer for more information.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60019T INVALID KEYPOINT FILE ADDRESS**

**Explanation:** An error was found converting the keypoint file address to the file address reference format 3 (FARF3).

**System Action:** None.

**User Response:** Check that the proper set of keypoints were used to create the TLD tape. If the proper CTKX was called, see your system programmer for more information.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60020T ATTEMPT TO LOAD CP WHEN NOT BSS**

**Explanation:** The control program can only be loaded to the basic subsystem (BSS).

**System Action:** None.

**User Response:** Do the following:

1. Correct the TLD tape.
2. Try again.

See *TPF System Installation Support Reference* for more information about loaders.

**CTL60091T REIPL SUBSYSTEM BEFORE ENTERING ZCYCL COMMAND**

**Explanation:** A terminal error occurred while running the auxiliary loader. Prior to this a component that requires a re-IPL was loaded to the online system packs. This re-IPL is

needed to include the data that was loaded into the subsystem.

**System Action:** None.

**User Response:** Do the following:

1. Correct the errors that were found previously.
2. IPL the TPF system again.

**Note:** A software re-IPL (through an irrecoverable error or a ZRIPL request) may destroy the contents of any keypoints that were loaded.

See *TPF System Installation Support Reference* for more information about loaders.

---

**CTL70001I FCTB LOADED — VERSION =** *xx*

**Where:**

*xx* Identifies the version of the program loaded.

**Explanation:** This is an informational message that is issued during auxiliary loader processing. The message indicates that the FCTB core image restart area program was loaded successfully.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**CTL70003I ICDF LOADED — VERSION =** *xx*

**Where:**

*xx* Identifies the version of the program loaded.

**Explanation:** This is an informational message that is issued during auxiliary loader processing. This message indicates that the ICDF core image restart area program was loaded successfully.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**CTL70004I ACPL LOADED — VERSION =** *xx*

**Where:**

*xx* Identifies the version of the program loaded.

**Explanation:** This is an informational message that is issued during auxiliary loader processing. This message indicates that the ACPL core image restart area program was loaded successfully.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**CTL70005I IPLB LOADED — VERSION =** *xx*

**Where:**

*xx* Identifies the version of the program loaded.

**Explanation:** This is an informational message that is issued during auxiliary loader processing. This message indicates that the IPLB core image restart area program was loaded successfully.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**CTL70006I SIGT LOADED — VERSION =** *xx*

**Where:**

*xx* Identifies the version of the program loaded.

**Explanation:** This is an informational message that is issued during auxiliary loader processing. This message indicates that the SIGT core image restart area program was loaded successfully.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**CTL70007I CGOT LOADED — VERSION =** *xx*

**Where:**

*xx* Identifies the version of the program loaded.

**Explanation:** This is an informational message that is issued during auxiliary loader processing. This message indicates that the core image restart area program was loaded successfully.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**CTL70008I RIAT LOADED — VERSION =** *xx*

**Where:**

*xx* Identifies the version of the program loaded.

**Explanation:** This is an informational message that is issued during auxiliary loader processing. The message indicates that the record ID attribute table (RIAT) core image restart area program was loaded successfully.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**CTL90001I CONTROL PROGRAM LOADED — VERSION = *xx***

**Where:**

*xx* Identifies the version of the program loaded.

**Explanation:** This is an informational message that is issued during auxiliary loader processing. This message indicates that the control program was loaded successfully.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**CTLA0001I KEYPOINTS LOADED OR PATCHED**

**Explanation:** This is an informational message that is issued during auxiliary loader processing. This message indicates that the keypoints were loaded or patched successfully.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**CTLA0007I TAPE LOAD COMPLETE REIPL ALL PROCESSORS WITHIN THE COMPLEX TO INCLUDE TAPE LOAD DATA LOADED TO THIS SUBSYSTEM**

**Explanation:** The auxiliary load for the subsystem is complete. Something other than a file-resident program was loaded.

**System Action:** None.

**User Response:** Perform an initial program load (IPL) of all the processors before continuing to use this subsystem on any processor.

**CTLA0008E SYSID ON TAPE INCORRECT**

**Explanation:** The subsystem ID (prefix) specified with the command does not match the subsystem ID on the tape, for example, that was specified by the SYSID card in the offline portion of the load.

**System Action:** None.

**User Response:** Do one of the following:

- Have your system programmer recreate the TLD tape with the proper SYSID value.
- If the TLD tape is correct, load that tape to the right subsystem.

**CTLA0009I TAPE LOAD COMPLETE**

**Explanation:** This is an informational message that indicates that the auxiliary load for this subsystem is complete.

**Note:** There are two completion messages for the auxiliary loader. One indicates that a re-IPL is required. However, this message indicates that a re-IPL is ***not*** required to use the subsystem.

**System Action:** None.

**User Response:** None.

**CTLB0050E IPLB CANNOT BE COPIED TO ALL ONLINE MODULES**

**Explanation:** An input/output (I/O) error occurred (for example, module down) while copying IPLB to a module other than the prime module. If there are multiple I/O errors to modules, this message is issued only once.

(This is a warning message only — processing resumes to EOJ.)

**System Action:** None.

**User Response:** Do the following:

1. Correct the problem that is causing the I/O errors.
2. Load IPLB again.

**CTLB0051E ERROR(S) FILING DUPLICATE COPY**

**Explanation:** A module input/output (I/O) error occurred while copying a core image restart area program to a duplicate module.

**Note:** This error is issued only once for any execution of the auxiliary loader.

**System Action:** None.

**User Response:** Do the following:

1. Correct the problem that is causing the I/O errors.
2. Load the core image restart area program again.

**CTLC0001A A REIPL IS REQUIRED TO INCLUDE THE TAPE LOAD DATA LOADED BY PROCESSOR *n* FOR SUBSYSTEM *yyyy***

**Where:**

*n* The processor ID.

*yyyy*
The subsystem name.

**Explanation:** Data was loaded through a ZTPLD request on the processor specified in the message for the subsystem named in the message. A re-IPL is required before the subsystem can be cycled above the 1052 state.

**System Action:** None.

**User Response:** As soon as possible you should perform a hardware re-IPL.

**Note:** A software re-IPL (through an irrecoverable error or a ZRIPL request) may destroy the content of any keypoints that were loaded.

See *TPF Operations* for more information about the ZRIPL command.

**CTLD0051A SIPC TIMED OUT TRYING TO INFORM PROCESSOR *n* THAT A REIPL IS REQUIRED TO INCLUDE THE TAPE LOAD DATA FOR SUBSYSTEM *yyyy***

**Where:**

*n* The processor ID.

*yyyy*
The subsystem name.

**Explanation:** The system interprocessor communications (SIPC) message processing timed out trying to inform the processor specified in the message that a re-IPL is required for the subsystem specified in the message before the subsystem should be allowed to cycle.

**System Action:** None.

**User Response:** Have the prime computer room agent set (CRAS) console operator for the processor specified in the message perform a hardware re-IPL as soon as possible.

**Note:** An irrecoverable error or a ZRIPL request may destroy the content of any keypoints that were loaded.

See *TPF Operations* for more information about the ZRIPL command.

**CTME0001W THE PCE CAN PERFORM ONLY A SUBSET OF FUNCTIONS. FOLLOW LOCAL PROCEDURES FOR REPORTING A PCE PROBLEM.**

**Explanation:** CTME received a service signal external interrupt indicating that the processor controller failed and fell back to limited function mode.

**System Action:** No overt software action is taken. The TPF system tries to continue running as long as the required processor functions are available.

**User Response:** See your IBM service representative.

**CTMS0001I TIME-SLICE INITIALIZATION COMPLETE**

**Explanation:** Initialization of the time-slice name table has completed successfully.

**System Action:** TPF system restart continues.

**User Response:** None.

**CTMS0002W RECORD ID CHECK ERROR ON TIME-SLICE NAME TABLE, RECORD IS BEING INITIALIZED**

**Explanation:** During TPF system restart, one of the following errors occurred with the time-slice name table (file copy):

- The table was not initialized.
- The table was corrupted.

**System Action:** The time-slice name table will be initialized from the hardcoded IBM defaults in the CTMS segment. A system error dump is issued and the TPF system restart continues. The original contents of the record are found in the system error dump.

**User Response:** This message is normal following the first IPL after loading the new time-slice support. If this message occurred under any other condition, the database could be corrupted further requiring more investigation.

**CTMS0003E UNABLE TO READ TIME-SLICE NAME TABLE**

**Explanation:** During TPF system restart, the TPF system was unable to read the time-slice name table (file copy) from file.

**System Action:** A system error dump is issued and TPF system restart continues.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Correct the error.

**CTMS0004E THE NUMBER OF TIME-SLICE NAMES HAS EXCEEDED THE MAXIMUM ALLOWABLE VALUE**

**Explanation:** The time-slice name table is initialized and the excess time-slice names are removed. The original contents of the file copy of the time-slice name table are found in the system error dump. You can rebuild the time slice name table by using the ZTMSL command. The maximum number of time-slice names that can be supported is 100.

**System Action:** A system error dump is issued and system restart continues.

**User Response:** Do the following:

1. Determine which excess time-slice names you need.
2. Enter the ZTMSL command with the REMOVE parameter specified to remove the excess time-slice names.
3. Enter the ZTMSL command with the ADD parameter specified to add the appropriate time slice names.

See *TPF Operations* for more information about the ZTMSL command.

**CTOC0002E UNIT CHECK RECEIVED FROM DEVICE TYPE *hhhh*, SDA *iiii*, NAME *jjjjjjj*, SENSE DATA *kkkk*, OLD CSW *llllllll llllllll***

**Where:**

*hhhh*
The device type.

*iiii* The symbolic device address (SDA).

*jjjjjjj*
The device name.

*kkkk*
The sense data.

*llllllll*
The channel status word (CSW).

**Explanation:** A unit check is received from the device specified in the message. The device is sensed to determine its status.

**System Action:** The last input/output (I/O) command is redriven if the error is recoverable. Otherwise, the symbolic device address (SDA) is halted and any associated path is stopped.

**User Response:** Do the following:

1. Correct the hardware problem.
2. Enter the START PATH command to re-establish communication after a path is stopped and provided spare SDAs are available.

---

**CTOC0005E HARDWARE PATH ERROR — DEVICE** *hhhhhhhh* **— UNITS** *uuuu uuuu*

**Where:**

*hhhhhhhh*
The device name.

*uuuu*
The units.

**Explanation:** A SENSE value of ATTN, BUSY during path startup normally indicates improper path definition, for example, the write unit is matched with a write unit or the read unit is matched with a read unit. A SENSE value of IR, ID normally indicates a reset on the other side of the path. This reset can be caused by a STOP PATH, a system reset, or an IPL.

**System Action:** The path is reprimed.

**User Response:** Errors other than unit check (UC) with intervention required (IR) and interface disconnect (ID) indicate unusual status that indicate potential hardware problems.

Do the following:

1. Correct the hardware problem.
2. Enter the START PATH command to re-establish communication after a path is stopped.

---

**CTSR0001I TCP/IP NATIVE STACK TABLES HAVE BEEN BUILT**

**Explanation:** This message is displayed during TPF system restart after the tables used by TCP/IP native stack support are built.

**System Action:** None.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP native stack support.

---

**CTSR0002I IP CONFIGURATION RECORD HAS BEEN INITIALIZED**

**Explanation:** This message is displayed during TPF system restart when the Internet Protocol (IP) configuration record is initialized.

**System Action:** None.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IP configuration record.

---

**CTSX0001I IP ROUTING TABLE BUILT**

**Explanation:** Internet Protocol (IP) restart processing completed building the in-core IP routing table from the IP routing table fixed file records (#IPRTE).

**System Action:** IP restart continues.

**User Response:** None.

See *TPF System Generation* and *TPF ACF/SNA Network Generation* for more information about the #IPRTE fixed file record type.

---

**CTSX0002I IP ROUTING TABLE RECORD HAS BEEN INITIALIZED**

**Explanation:** Internet Protocol (IP) restart processing has built the in-core IP routing table for the first time and has filed out the table header information in the initial IP routing table fixed file record (#IPRTE).

**System Action:** IP restart continues.

**User Response:** None.

See *TPF System Generation* and *TPF ACF/SNA Network Generation* for more information about the #IPRTE fixed file record type.

---

**CTSX0003W IP ROUTING RECORDS DEFINED —** *allocated* **RECORDS REQUIRED FOR MAX SIZE TABLE —** *required*

**Where:**

*allocated*
The total number of Internet Protocol (IP) routing table fixed file records (#IPRTE) allocated.

*required*
The number of #IPRTE records required to file out the maximum number of in-core IP routing table entries.

**Explanation:** IP restart processing determined that there are not enough #IPRTE records available to file out the in-core IP routing table if the table reaches its maximum size.

**System Action:** IP restart continues.

**User Response:** Determine if it is necessary to allocate more #IPRTE records.

See *TPF System Generation* and *TPF ACF/SNA Network Generation* for more information about the #IPRTE fixed file record type.

---

**CTSX0004E FACS ERROR ON IP ROUTING TABLE RECORD RECORDS REQUIRED FOR MAX SIZE TABLE —** *required*

**Where:**

*required*
The total number of Internet Protocol (IP) routing table fixed file records (#IPRTE) required to file out the maximum number of in-core IP routing table entries.

**Explanation:** IP restart processing determined that the in-core IP routing table has been allocated, but there are no #IPRTE records to file out the contents of the table.

**System Action:** IP restart continues. The IP routing table cannot be used and has no entries available and no entries in-use.

**User Response:** Do one of the following:

- If there should be no IP routing table support defined, do the following:
  1. Enter the ZNKEY command with a value of zero specified for the MAXRTE parameter to remove IP routing table support.
  2. Perform an initial program load (IPL) of the TPF system.
- If there should be IP routing table support defined, do the following:
  1. Define and allocate the appropriate number of #IPRTE records. This number can be as high as the number of records required to file out the maximum number of in-core IP routing table entries that is indicated in the message.
  2. IPL the TPF system.

See *TPF Operations* for more information about the ZNKEY command. See *TPF System Generation* and *TPF ACF/SNA Network Generation* for more information about the #IPRTE fixed file record type.

---

**CTSX0007I IP ROUTING RECORDS INCREASED FROM** *previous* **TO** *current*

**Where:**

*previous*
The number of Internet Protocol (IP) routing table fixed file records (#IPRTE) allocated by IP restart at the time of the previous IP routing table build.

*current*
The number of #IPRTE records currently allocated.

**Explanation:** IP restart processing determined that additional #IPRTE records have been allocated to the TPF system.

**System Action:** IP restart continues.

**User Response:** Verify that this increase in the number of #IPRTE records is correct.

See *TPF System Generation* and *TPF ACF/SNA Network Generation* for more information about the #IPRTE fixed file record type.

---

**CTSX0008W IP ROUTING RECORDS DECREASED FROM** *previous* **TO** *current*

**Where:**

*previous*
The number of Internet Protocol (IP) routing table fixed file records (#IPRTE) allocated by IP restart at the time of the previous IP routing table build.

*current*
The number of #IPRTE records currently allocated.

**Explanation:** IP restart processing determined that the number of #IPRTE records allocated to the TPF system has been decreased.

**System Action:** IP restart continues.

**User Response:** Verify that this reduction in the number of #IPRTE records is correct.

See *TPF System Generation* and *TPF ACF/SNA Network Generation* for more information about the #IPRTE fixed file record type.

---

**CTSX0009E IP ROUTING TABLE CANNOT HOLD ALL IPRTE RECORD DATA IP ROUTING TABLE ENTRIES REQUIRED —** *entries*

**Where:**

*entries*
The number of in-core Internet Protocol (IP) routing table entries that are required to hold all of the entries on file.

**Explanation:** IP restart processing determined that the number of entries filed out in the #IPRTE records will not fit in the in-core IP routing table.

**System Action:** A system error is issued and the entry control block (ECB) exits. The RESTART ABORTED STATE CHANGE DISABLED message may be printed and the restart schedule ends abnormally.

**User Response:** Do the following:

1. Enter the ZNKEY command with the MAXRTE parameter specified to increase the number of in-core IP routing table entries.
2. Perform an initial program load (IPL) of the TPF system.

See *TPF Operations* for more information about the ZNKEYcommand. See *TPF System Generation* and *TPF ACF/SNA Network Generation* for more information about the #IPRTE fixed file record type.

# CT09–CVZB

---

**CT090001I RLOG ALLOCATION REDUCED TO FIT INTO VPARS BUFFER AREA**

**Explanation:** Segment CT09 determined that the number of records allocated for the recovery log that is used by TPF transaction services is more than can be contained in the VPARS buffer area. Segment CT09 reduced the number of records to be a percentage (contained in keypoint A) of the records allocated for the VPARS buffer area.

**System Action:** Initialization continues.

**User Response:** None.

---

**CT090002W UNABLE TO REDUCE RLOG ALLOCATION FOR VPARS**

**Explanation:** Segment CT09 determined that the number of records allocated for the recovery log that is used by TPF transaction services cannot be reduced by the percentage contained in keypoint A. Any attempt to do so would result in a recovery log that is too small to use.

**System Action:** Initialization continues.

**User Response:** Do the following:

1. Enter the ZCTKA ALTER command with the RLVAL parameter specified to change the percentage value in keypoint A to be a higher percentage of the VPARS buffer area.
2. IPL the TPF system again.
3. If this approach is not successful, increase the size of the VPARS buffer area.

See *TPF Operations* for more information about the ZCTKA ALTER command.

---

**CT240002I TPFDF CENTRAL DATABASE TABLE ALLOCATED**

**Explanation:** The TPF Database Facility (TPFDF) central database table was allocated successfully. This table is an index into the TPFDF database descriptors (DBDEF).

**System Action:** None.

**User Response:** None.

See the IBM TPFDF library for more information about the IBM TPFDF product.

---

**CT240003I TPFDF FAST-LINK TABLE ALLOCATED**

**Explanation:** The TPF Database Facility (TPFDF) fast-link table was allocated successfully. This table contains the addresses of the TPFDF fast-link programs.

**System Action:** None.

**User Response:** None.

See the IBM TPFDF library for more information about the IBM TPFDF product.

---

**CT240004I TPFDF CRUISE KEYPOINT AREA ALLOCATED**

**Explanation:** The TPF Database Facility (TPFDF) capture/restore utility, information and statistics environment (CRUISE) keypoint area was allocated successfully.

**System Action:** None.

**User Response:** None.

See the IBM TPFDF library for more information about the IBM TPFDF product.

---

**CT400001I VFA DELAYED FILE DATA DESTROYED — CONTINUING**

**Explanation:** The size of virtual file access (VFA) was reduced to allow working storage blocks to fit below the start of VFA.

**System Action:** IPL is continued unless CCCTIN is aborted. Also see the CT400002E, CT400003E, and CT400004E messages.

**User Response:** None unless CCCTIN is aborted or a ZFKPA CAN or a ZFKPA RED command is needed during TPF system restart.

---

**CT400002E WORKING STORAGE LESS THAN 3 MEG — ABORTING**

**Explanation:** The size of working storage is too small to continue TPF system initialization.

**System Action:** The values of the current registers and the old PSW program are written to the console and the TPF system enters a disabled wait state.

**User Response:** Do the following:

1. Increase the amount of storage.
2. IPL the TPF system again.

---

**CT400003E FRAMES MUST BE BELOW 15 MEG — ABORTING**

**Explanation:** The start of working storage cannot be allocated above the 15M storage line. When carving working storage, the TPF system needs to allocate all of the common blocks below the 15M storage line before it allocates all of the frames.

**System Action:** The values of the current registers and the old PSW program are written to the console and the TPF system enters a disabled wait state.

**User Response:** Do the following:

1. Remove some of the data that is above the 15 M storage line because there is too much there or move it above 16 MB.
2. IPL the TPF system again.

---

**CT400004E UNABLE TO REDUCE TO FIT — ABORTING**

**Explanation:** The TPF system was unable to reduce the number of blocks allocated in working storage so that these blocks would fit below the start of virtual file access (VFA).

**System Action:** The values of the current registers and the old PSW program are written to the console and the TPF system enters a disabled wait state.

**User Response:** Do the following:

1. Increase the amount of storage or reduce the size of VFA.
2. IPL the TPF system again.

---

**CT400005I WORKING STORAGE REDUCED — CONTINUING**

**Explanation:** The number of blocks allocated in working storage was reduced so that these blocks would fit below the start of virtual file access (VFA).

**System Action:** The IPL of the TPF system is continued but it will prompt you during TPF system restart to enter the ZFKPA RED or the ZFKPA CAN command.

**User Response:** During TPF system restart, do one of the following:

- Enter a ZFKPA RED command to continue TPF system restart.
- Enter a ZFKPA CAN command to cancel TPF system restart.

---

**CT400006I NUMBER OF COMMON BLOCKS REDUCED — CONTINUING**

**Explanation:** The number of common blocks allocated in working storage was reduced because they all need to be allocated below the 15M storage line.

**System Action:** The IPL of the TPF system is continued but it will prompt you during TPF system restart to enter a ZFKPA RED or a ZFKPA CAN command.

**User Response:** During TPF system restart, do one of the following:

- Enter a ZFKPA RED command to continue TPF system restart.
- Enter a ZFKPA CAN command to cancel TPF system restart.

**CT400007I NUMBER OF ECBS/FRAMES REDUCED — CONTINUING**

**Explanation:** In virtual equals-real (VEQR) mode, all the frames and ECBs must be below 16MB because remapping through the use of virtual addresses is not allowed. This message indicates that the number of frames or ECBs was reduced to fit below 16MB. This will only happen in VEQR mode.

**System Action:** The IPL of the TPF system is continued but it prompts you during TPF system restart to enter the ZFKPA RED or the ZFKPA CAN command.

**User Response:** During TPF system restart, do one of the following:

- Enter a ZFKPA RED command to continue TPF system restart.
- Enter a ZFKPA CAN command to cancel TPF system restart.

**CT400008I MAXIMUM NUMBER OF THREADS PER PROCESS REDUCED — CONTINUING**

**Explanation:** Threads are enabled by setting the MTHD field in keypoint A (CTKA) to a value greater than 0. The MTHD field specifies the maximum number of threads allowed for each process. This message is displayed if the TPF system cannot allocate the number of threads specified in the MTHD field.

**System Action:** The TPF system initial program load (IPL) continues, but you are prompted during TPF system restart to enter the ZFKPA RED or ZFKPA CAN command.

**User Response:** During TPF system restart, do one of the following:

- Enter the ZFKPA RED command to continue TPF system restart.
- Enter the ZFKPA CAN command to cancel TPF system restart.

See *TPF Operations* for more information about the ZFKPA RED and ZFKPA CAN commands.

**CT400009I PAGES REMOVED TO ACCOMMODATE VIRTUAL ADDRESS SPACE — CONTINUING**

**Explanation:** The TPF system detected that there was a conflict between real storage and virtual addresses required by the TPF system. The conflict occurs because there is more real storage on the processor than what the current TPF system configuration can use.

**System Action:** The pages in conflict are moved from online system use to the machine check queue. The TPF system IPL continues but you are prompted during TPF system restart to enter the ZFKPA RED or the ZFKPA CAN command.

**User Response:** During TPF system restart, do one of the following:

- Enter the ZFKPA RED command to continue TPF system restart.
- Enter the ZFKPA CAN command to cancel TPF system restart.

See *TPF Operations* for more information about the ZFKPA RED and ZFKPA CAN commands.

**CT400010I THREADS DISABLED BECAUSE THREAD STACK SIZE IS 0 — CONTINUING**

**Explanation:** Space for threads cannot be allocated because the size of the C stack for a thread is defined in keypoint A (CTKA) as zero. If an application program tries to create a thread, an error will occur.

**System Action:** The TPF system initial program load (IPL) continues, but threads will not be created.

**User Response:** Enter the ZCTKA ALTER command with the TSTK parameter specfied to change the size of the thread stack and enable threads.

See *TPF Operations* for more information about the ZCTKA ALTER command.

**CMVR0001I VIPA-*x.x.x.x* MOVED FROM CPU-*y* to CPU-*z***

**Where:**

*x.x.x.x*
The virtual IP address (VIPA).

*y* The TPF processor ID from which the VIPA moved.

*z* The TPF processor ID to which the VIPA moved.

**Explanation:** A VIPA was moved from one TPF processor to another TPF processor because of a processor failure.

**System Action:** None.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about movable VIPAs.

**CMVR0002I OSA SHARED IP TABLE INITIALIZATION IS COMPLETED**

**Explanation:** The OSA shared IP address table (OSIT) was initialized during TPF system restart.

**System Action:** None.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about OSIT.

---

**CMVR0003W DEFAULT IP-*x.x.x.x* IS NOT OWNED BY THIS PROCESSOR**

**Where:**

*x.x.x.x*
The virtual IP address (VIPA).

**Explanation:** The default local Internet Protocol (IP) address for this processor is a movable VIPA that has been moved to another processor. This can happen in one of two ways:

- The ZVIPA command was entered with the MOVE parameter specified.
- When the processor failed or became inactive, the VIPA processor deactivation user exit (UVIP) moved the VIPA in question to another processor.

**System Action:** None.

**User Response:** A default IP address is required when the TPF system is the client and the application does not bind to a specific, local IP address. Do one of the following to select this IP address:

- Enter the ZTTCP CHANGE command to select a new default local IP address.
- Enter the ZOSAE or ZTTCP DEFINE command to define a new IP address and make it the default local IP address.
- Enter the ZVIPA command with the MOVE parameter specified to move the VIPA back to the central processing unit (CPU).

See *TPF Operations* for more information about the ZOSAE and ZTTCP commands. See *TPF System Installation Support Reference* for more information about the UVIP user exit.

---

**CUAK0023E ERROR ON OBR/MDR TAPE WRITE**

**Explanation:** An error was found while trying to log the EREP unit record device information to the primary real-time (RTA) tape.

**System Action:** The logging ECB is ended.

**User Response:** None.

See *TPF Database Reference* for more information about the unit record error logging program.

---

**CUDZ0001E SOCKET ERROR READING UDD CLIENT MESSAGE - *rtcode***

**Where:**

*rtcode*
The return code to the socket call in decimal format.

**Explanation:** The universal data display server (UDDS) tried to read a message from the client, but a Transmission Control Protocol/Internet Protocol (TCP/IP) error occurred.

**System Action:** The UDDS communication ends for this client session.

**User Response:** Determine the cause of the TCP/IP error and correct the problem.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the socket error return code.

---

**CUDZ0002E SOCKET ERROR PROCESSING UDD CLIENT SELECT - *rtcode***

**Where:**

*rtcode*
The return code to the socket call in decimal format.

**Explanation:** The universal data display server (UDDS) received an error from the Transmission Control Protocol/Internet Protocol (TCP/IP) `select` application programming interface (API).

**System Action:** The UDDS communication ends for this client session.

**User Response:** Determine the cause of the TCP/IP error and correct the problem.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the socket error return code.

---

**CUDZ0003E SOCKET ERROR WRITING UDD CLIENT MESSAGE - *rtcode***

**Where:**

*rtcode*
The return code to the socket call in decimal format.

**Explanation:** The universal data display server (UDDS) tried to send a message to the client, but a Transmission Control Protocol/Internet Protocol (TCP/IP) error occurred.

**System Action:** The UDDS communication ends for this client session.

**User Response:** Determine the cause of the TCP/IP error and correct the problem.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the socket error return code.

---

**CUDZ0099E NOT ENOUGH STORAGE TO START THE UDD SERVER**

**Explanation:** The universal data display server (UDDS) tried to start, but there was not enough entry control block (ECB) heap storage available to allocate the Transmission Control Protocol/Internet Protocol (TCP/IP) buffers.

**System Action:** The UDDS ends for this client session.

**User Response:** Do the following:

1. Enter the ZCTKA ALTER command to increase the amount of ECB heap storage.
2. Perform an initial program load (IPL) of the TPF system.
3. Run the ECB again.

See *TPF Operations* for more information about the ZCTKA ALTER command.

---

**CUPT0001I RECORD ID DOES NOT MATCH, RECORDS WILL BE INITIALIZED**

**Explanation:** A mismatch in the record ID for the positive feedback records was found unexpectedly.

**System Action:** The TPF system handles the proper initialization of the positive feedback records.

**User Response:** None.

**CVAD0000E APPLICATION NOT AVAILABLE**

**Explanation:** The command entered is destined for an application program that is not available or is stopped.

**System Action:** None.

**User Response:** Do the following:

1. Determine the status of the application program.
2. Take the necessary corrective action.
3. Entered the command again.

See *TPF Operations* for more information about the ZROUT and ZDRCT commands, and the message prefixing function.

**CVAD0004E INVALID DELIMITER**

**Explanation:** The character following the four character secondary action code must be a blank, a carriage return, an end of message, or two slashes when prefixing is used.

**System Action:** None.

**User Response:** Enter the command again correctly.

See *TPF Operations* for more information about the message prefixing function.

**CVAD0008E ILLEGAL FUNCTION — 1052 TERMINAL NOT CRAS**

**Explanation:** The terminal address (TA) is not in the computer room agent (CRAS) table.

**System Action:** None.

**User Response:** Add the TA to the CRAS table.

See *TPF Operations* for more information about the ZACRS command and the message prefixing function.

**CVAD0012E ILLEGAL FUNCTION — NO LINKAGE FOUND**

**Explanation:** The command entered is not found in the command editor table.

**System Action:** None.

**User Response:** See your system programmer for more information.

See *TPF Operations* for more information about the message prefixing function.

**CVAD0013E ZMSG—Z*xxxx* TRIES TO ENTER *yyyy*, BUT SEGMENT IS NOT LOADED**

**Where:**

*xxxx*
The secondary action code of the command.

*yyyy*
The segment defined to process the command.

**Explanation:** One of the following errors occurred:

- The command entered does not have the segment associated with the command loaded to the subsystem where the message was entered.
- The BSS copy of the segment was requested to process the command on a subsystem, but the BSS does not have the segment loaded.

**System Action:** The command specified in this message is rejected.

**User Response:** One of the following errors occurred:

- The command may have been entered on a subsystem that does not have the segment loaded to process the command.
- In the case of the ZFMSG-created commands, the segment to be associated with the new command may have been specified incorrectly when entering theZFMSG command.

See *TPF Operations* for more information about the message prefixing function and about theZFMSG command.

**CVAD0016E ILLEGAL FUNCTION — CP NOT IN TEST MODE**

**Explanation:** The command entered is restricted to a TPF system that was generated as a test TPF system.

**System Action:** None.

**User Response:** If entry is required on a production system, enter the ZFMSG command with the CHANGE parameter specified and the NOTST keyword specified to enable use of this command.

See *TPF Operations* for more information about the message prefixing function and the ZFMSG command.

**CVAD0024E ILLEGAL FUNCTION — EP PROCESSOR ONLY ID — *cpuid***

**Where:**

*cpuid*
The central processing unit (CPU) ID.

**Explanation:** The command entered can only be processed in the emulator program (EP) processor.

**System Action:** None.

**User Response:** Do one of the following:

- Enter the command again with a prefix of the EP processor.
- Enter the command from a computer room agent set (CRAS) console connected to the EP processor.

See *TPF Operations* for more information about the message prefixing function.

### CVAD0028E ILLEGAL FUNCTION — BASIC SUBSYSTEM ONLY

**Explanation:** The command entered can only be processed within the basic subsystem (BSS).

**System Action:** None.

**User Response:** Enter the command again, ensuring that it is directed to the BSS.

See *TPF Operations* for more information about the message prefixing function.

### CVAD0032E ILLEGAL FUNCTION — SSU DORMANT

**Explanation:** The command is not authorized to be processed in a dormant subsystem.

**System Action:** None.

**User Response:** Do the following:

1. Ensure that the receiving subsystem is active.
2. Enter this command again.

See *TPF Operations* for more information about the message prefixing function.

### CVAD0036E INVALID REQUEST

**Explanation:** A command processor entered CVAD with a message index that is not valid.

**System Action:** None.

**User Response:** Do one of the following:

- Update the command processor to dated to call CVAD with the correct message index.
- Add the appropriate message to the CVAD at that index.

See *TPF Operations* for more information about message prefixing.

### CVAD0040E ILLEGAL FUNCTION — SUBSYSTEM/APPL NAME INVALID

**Explanation:** The application program name or the subsystem name specified is not valid.

**System Action:** None.

**User Response:** Enter the command again with the correct prefix.

See *TPF Operations* for more information about message prefixing.

### CVAD0044E

**Explanation:** The designated subsystem was not included in the last IPL or is inactive.

**System Action:** None.

**User Response:** Re-IPL the designated subsystem.

See *TPF Operations* for more information about message prefixing.

### CVAD0048E APPLICATION PREFIXING RESTRICTED TO BSS

**Explanation:** The prefixing of application programs is restricted to the basic subsystem (BSS).

**System Action:** None.

**User Response:** Ensure that all application program prefixing is entered in the BSS.

See *TPF Operations* for more information about message prefixing.

### CVAD0052E ALL PREFIX IS VALID ONLY FROM PRC OR LOCAL 3270

**Explanation:** The ALL prefix can be specified only from the prime computer room agent set (CRAS) console or a local 3270 defined as an alternate CRAS console.

**System Action:** None.

**User Response:** Do one of the following:

- Enter the command from the prime CRAS or a local 3270 defined as an alternate CRAS.
- Enter the command once for each destination (prefixed with each destination) from the remote CRAS terminal.

See *TPF Operations* for more information about message prefixing.

### CVAD0056E FUNCTION ONLY VALID FROM PRIME CRAS

**Explanation:** A command was entered from a terminal other than the prime computer room agent set (CRAS) console and the command was defined as being restricted to the prime CRAS console.

**System Action:** None.

**User Response:** Do one of the following:

- Enter the command from the prime computer room agent set (CRAS) console..
- Remove the restriction by entering the ZFMSG CHANGE command with the NOPCO keyword specified.

See *TPF Operations* for more information about message prefixing and the ZFMSG CHANGE command.

### CVCO0005T INVALID CYCLE REQUEST

**Explanation:** The TPF system is already in the requested state (basic subsystem (BSS) only) or an attempt was made to cycle up from or cycle down to UTIL state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

**CVCT0001I CYCLE TO *xxxx*–STARTED**

**Where:**

*xxxx*
The TPF system state (1052, NORM, CRAS, MESW, UTIL).

**Explanation:** This is a normal response to the ZCYCL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

---

**CVCT0002A TURN OFF FOLLOWING ACTIVE UTILITIES OR ALLOW TO COMPLETE. THEN RE-ENTER ZCYCL MSG.** *zzz...zzz <zzz...zzz>*

**Where:**

*zzz* The utility names.

**Explanation:** The utilities specified in the message are *lethal utilities:*. Cycling is not allowed while these utilities are running because the:

- TPF system integrity may be damaged
- Data generated by the utility would not incorrect.

**System Action:** The ZCYCL request is not honored and the ECB is ended.

**User Response:** Do one of the following:

- Turn off the utilities or wait for them to complete before entering the ZCYCL command again.
- If the TPF system must be cycled while utilities are active, then force cycling by entering the ZCYCL command with the BP parameter specified.

See *TPF Operations* for more information about the ZCYCL command.

---

**CVCT0003W THE FOLLOWING ACTIVE LETHAL UTILITIES WERE RUNNING PRIOR TO IPL.** *zzz...zzz <zzz...zzz>*

**Where:**

*zzz* The utility names.

**Explanation:** A software IPL occurred while a *lethal utility* was running.

**System Action:** The TPF system returned back to its original state. The utilities specified in the message ended or were stopped and can be restarted.

**User Response:** None.

See *TPF Operations* for more information about the ZRIPL and ZCYCL commands.

---

**CVCT0004W IF YOU ARE ABOUT TO SWITCHOVER, TURN OFF FOLLOWING UTILITIES WHEN YOU GET TO 1052 STATE.** *zzz...zzz <zzz...zzz>*

**Where:**

*zzz* The utility names.

**Explanation:** The utilities listed are *non-lethal utilities*. These utilities allow a state change, but they should be turned off if switching over to a standby machine. This message appears only when the TPF system is being cycled down.

**System Action:** The TPF system continues cycling down to the requested state.

**User Response:** Turn off the utilities if you are switching over to a standby machine.

See *TPF Operations* for more information about the ZCYCL command.

---

**CVCT0005A UTILITY PROGRAMS ACTIVE, NAMES UNKNOWN DUE TO READ ERROR.**

**Explanation:** A read error occurred that prevented a listing of active TPF system or user utilities following a ZCYCL request. Cycling is not allowed while *lethal utilities* are running because the:

- TPF system integrity may be damaged
- Data generated by the utility would be incorrect.

**System Action:** The ZCYCL request is not honored and the ECB is ended.

**User Response:** Do one of the following:

- Force cycling by entering the ZCYCL BP command.
- Do the following:
  1. See your system program or your IBM service representative to determine whether a physical problem exists at the address allocated to the CVCM program.
  2. Correct the hardware problem.

See *TPF Operations* for more information about the ZCYCL command.

---

**CVCT0006A UTILITY PROGRAMS ACTIVE PRIOR TO IPL, NAMES UNKNOWN DUE TO READ ERROR.**

**Explanation:** A read error occurred that prevented a listing of active lethal TPF system or user utilities that were active prior to the IPL.

**System Action:** The TPF system returned back to its original state. The utilities not specified in the message ended or were stopped and can be restarted.

**User Response:** See your system programmer or your IBM service representative to determine whether a physical problem exists at the address allocated to the CVCM program. Then, correct the hardware problem.

See *TPF Operations* for more information about the ZCYCL command.

---

**CVCX0001I** *ss zzzz* **NOW IN** *xxxx* **STATE**

**Where:**

*ss* The subsystem name.

*zzzz*
The function code from which the message originated.

*xxxx*
The TPF system state (1052, NORM, CRAS, MESW, UTIL).

**Explanation:** This is a normal response to the ZCYCL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

---

**CVCX0002I SYSTEM IN 1052. TO SWITCHOVER PRESS SYS RESET THIS M/C, IPL OTHER**

**Explanation:** This message replaces the CVCX0001I message upon reaching 1052 state when the cycle request is to 1052 state and is for the basic subsystem (BSS).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

---

**CVCX0003I RCVY IPL**

**Explanation:** This message is issued as a result of the ZCYCL command or an external interrupt. Prior to this message the system state indicator is set.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

---

**CVCW0001I START OF MISSING ECBS**

**Explanation:** During the cycle down all attempts to purge activity from the TPF system were unsuccessful. The count of active ECBs cannot be reduced to one. While scanning the list of all ECBs in the TPF system, it was found that one or more ECBs were not available and therefore missing. This message is followed by the list of the missing ECB addresses.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

---

**CVCW0002I ECB ADDRESS** *xxxxxxxx*

**Where:**

*xxxxxxxx*
The missing ECB address.

**Explanation:** During the cycle down all attempts to purge activity from the TPF system were unsuccessful. The count of active ECBs cannot be reduced to one. While scanning the list of all ECBs in the TPF system, it was found that the displayed ECB address was not available and therefore missing.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

---

**CVCW0003I END OF MISSING ECBS**

**Explanation:** During the cycle down all attempts to purge activity from the TPF system were unsuccessful. The count of active ECBs cannot be reduced to one. While scanning the list of all ECBs in the TPF system, it was found that one or more ECBs were not available and therefore missing. This message follows the list of the missing ECB addresses.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

---

**CVDW0146A** *zzzz nnnn* **MOUNT** *yyy* **TAPE**

**Where:**

*zzzz*
The function code from which the message originated.

*nnnn*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*yyy* The symbolic tape name.

**Explanation:** This message indicates that a tape mount ECB is waiting on the tape wait list. The COSK079A message was issued previously but the tape has not been mounted.

**System Action:** None.

**User Response:** Enter the ZTMNT command to mount hte tape specified in the message.

See *TPF Operations* for more information about the ZTMNT command.

---

**CVFI0001I ZSTAT CRET RESUMED**

**Explanation:** A CRET from the previous IPL was reactivated.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTAT command.

---

**CVFI0051E UNABLE TO UPDATE CCP KEYPOINT FREQUENCY**

**Explanation:** The TPF system is unable to retrieve keypoint A. Processing continues without updating the CCP keypoint frequency.

**System Action:** None.

**User Response:** None.

---

**CVML0001W LOST INTERRUPT RETRY ON SUBCHANNEL** *num*, *type* **LINE** *line*

**Where:**

*num*
The subchannel number.

*type*
The line type.

*line* The symbolic line number.

**Explanation:** An input/output (I/O) was not received from a non-SNA device within the interval specified in keypoint E (CTKE).

**System Action:** The I/O is retried once.

**User Response:** Check the device to ensure that the device is online and functional.

---

**CVML0002E INTERRUPT IS LOST ON SUBCHANNEL** *num*, *type* **LINE** *line*

**Where:**

*num*
The subchannel number.

*type*
The line type.

*line* The symbolic line number.

**Explanation:** An input/output (I/O) interrupt was not received from a non-SNA device within the interval specified in keypoint E (CTKE) after the retry.

**System Action:** The device is invalidated and a backup device is used if it is available.

**User Response:** Determine why the device is not functional.

---

**CVMQ0000I DEVICE QUEUE RESTARTED, SCA** *addr*, **SLN** *ln*

**Where:**

*addr*
The subchannel address in hexadecimal.

*ln* The symbolic line number in hexadecimal.

**Explanation:** A hung 3270 local device queue was restarted. This message is sent only to the hung device except in the case of the prime computer room agent set (CRAS) console when the message is copies to the receive-only (RO) CRAS console.

This message is a symptom of input/output (I/O) (or the lack of interrupts) not consistent with what 3270 local interrupt routines expect either for successful I/O or for error conditions. Regular receipt of this message may indicate problems in the device or in the channel hardware servicing the device.

**System Action:** None.

**User Response:** None.

---

**CVMQ0001I CONTROL UNIT QUEUE RESTARTED, SCA** *addr*, **SLN** *ln*

**Where:**

*addr*
The subchannel address in hexadecimal.

*ln* The symbolic line number in hexadecimal.

**Explanation:** A hung 3270 local control unit queue was restarted. This message is sent only to the device attempting input/output (I/O) through the hung queue, except in the case of the prime computer room agent set (CRAS) console when the message is copied to the receive-only (RO) CRAS console.

This message is a symptom of I/O interrupts (of the lack of interrupts) not consistent with what 3270 local interrupt routines expect either for successful I/O or for error conditions. Regular receipt of this message may indicate problems in the device or in the channel hardware servicing the device.

**System Action:** None.

**User Response:** None.

---

**CVRI0001E UNABLE TO VERIFY IMAGE STATUS**

**Explanation:** An error occurred during restart when retrieving the image control record or image history record.

**System Action:** Restart is continued without verifying the image status.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Re-IPL the TPF system.

See *TPF Main Supervisor Reference* for more information.

---

**CVRI0002W IMAGE** *name* **IS NO LONGER ENABLED**

**Where:**

*name*
The image name.

**Explanation:** A restart determined that the image selected during IPL (which was enabled at that time) was disabled by another processor.

**System Action:** None.

**User Response:** To run the TPF system with this image, enable the image and re-IPL the processor using it.

See *TPF Main Supervisor Reference* for more information.

---

**CVRI0003W IMAGE** *name* **VERIFICATION ERROR**

**Where:**

*name*
The image name.

**Explanation:** Restart found that one of the enabled images in the TPF system has address mismatches against the file address compute program (FACE) table being used in the processor that is being IPLed.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the FCTB address mismatch.
2. Load the TPF system again or re-IPL it.

See *TPF Main Supervisor Reference* for more information.

---

**CVRI0004E UNABLE TO PERFORM LOADER REQUESTED UPDATES**

**Explanation:** An error occurred while restart was trying to complete updates requested by the offline loader.

**System Action:** Restart continues.

**User Response:** This message is preceded by other messages that provide more information about the type of error that occurred. Refer to the explanation of those messages to determine the appropriate action.

See *TPF Main Supervisor Reference* and *TPF System Installation Support Reference* for more information.

---

**CVRM0001E FIND ERROR — CTKV SUBSYSTEM** *xxxx*

**Where:**

*xxxx*
The subsystem name.

**Explanation:** There was a FIND error in the CTKV subsystem specified in the message. The error may be the result of a hardware or software error.

**System Action:** The restart processing is continued without updating CTKV for the test subsystem specified at IPL time.

**User Response:** Have your system programmer determine if the error is a software error and correct it. Be sure to specify the volume number at the next TPF system IPL to the test subsystem is included.

---

**CVRM0002E FILE ERROR — CTKV, SUBSYSTEM** *xxxx*

**Where:**

*xxxx*
The subsystem name.

**Explanation:** There was a FILE error in the CTKV subsystem specified in the message.

**System Action:** The restart processing is continued without updating the volume serial number keypoint record (CTKV) for the test subsystem specified at IPL time.

**User Response:** See your system programmer for more information.

See the CVRM01E message for more information.

---

**CVRM0003E FILE ERROR – CTKM, CYCLE UP INHIBITED**

**Explanation:** There was a FILE error that has inhibited the cycle up.

**System Action:** The state change is disabled and the restart processing is continued.

**User Response:** Do the following:

1. Have your system programmer determine the cause of the problem and correct it.
2. IPL the TPF system again.

---

**CVRM0004T FIND ERROR — CTKM, RESTART TERMINATED**

**Explanation:** There was a FIND error so the restart ended.

**System Action:** None.

**User Response:** See your system programmer or an IBM service representative to correct the problem.

---

**CVRM0005T MDBF ENVIRONMENT NOT SAME IN ALL PROCESSORS SWITCH TO UNI-PROC TO CHANGE THE ENVIRONMENT — RESTART TERMINATED**

**Explanation:** The subsystem ID in keypoint M is not valid or is not available.

**System Action:** A CTL-41E system error is issued followed by this message and restart is ended.

**User Response:** None.

---

**CVRM0006T INVALID SS ID IN CTKM, RESTART TERMINATED**

**Explanation:** One of the following errors occurred:

- Another processor, under a loosely coupled environment, filed a modified copy of keypoint M and this processor is not synchronized with the other processors.
- The core copy or file copy of keypoint M was corrupted.

**System Action:** A CTL-41E system error is issued followed by this message and restart is ended.

**User Response:** None.

---

**CVRN0004I RESTART COMPLETED — 1052 STATE**

**Explanation:** TPF system restart is completed and the TPF system can now be cycled up.

**System Action:** None.

**User Response:** None.

---

**CVRN0005W DUMP STORAGE KEYWORD LIST CHANGED SINCE LAST IPL — ZIDOT DUMP OVERRIDES DELETED FROM SYSTEM**

**Explanation:** The number of dump keywords defined in the TPF system changed since the last IPL. This effectively invalidates any ZIDOT overrides stored on file since the DOBT entries on file are no longer of the correct size.

**System Action:** The ZIDOT overrides on file are deleted and the file records are initialized again. Restart is continued.

**User Response:** None.

---

**CVRQ0002I KEYPT COPY FOR SS *xxxx* FROM REL MOD *yy* COMPLETE**

**Where:**

*xxxx*
The subsystem name.

*yy* The relative module number.

**Explanation:** Keypoints were copied successfully from the IPL module to the prime module.

**System Action:** None.

**User Response:** None.

**CVRQ0003I KEYPT COPY FOR SS *xxxx* FROM FALLBACK EXT #KFBX*nnn* COMPLETE**

**Where:**

*xxxx*
The subsystem name.

*nnn*
The fallback extent number in decimal.

**Explanation:** Keypoints were copied successfully from the fallback extent area specified in the message to the prime module.

**System Action:** None.

**User Response:** None.

**CVRQ0010E KEYPT COPY ABORTED FOR SS *xxxx***

**Where:**

*xxxx*
The subsystem name.

**Explanation:** An error condition occurred such that keypoint copy could not complete.

**System Action:** None.

**User Response:** None.

**CVVA0000E INVALID TPFDF FUNCTIONAL MESSAGE, ECB EXITED**

**Explanation:** A TPF Database Facility (TPFDF) command that is not valid was entered.

**System Action:** The command is rejected.

**User Response:** Enter a valid TPFDF command.

See the IBM TPFDF library for more information about the IBM TPFDF product.

**CVVA0002E TPFDF ENTRY NOT ALLOWED IN 1052/UTIL STATE**

**Explanation:** A TPF Database Facility (TPFDF) command was entered that is not valid in 1052 or UTIL state.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZCYCL command to cycle to a higher TPF system state.
2. Enter the TPFDF command again.

See *TPF Operations* for more information about the ZCYCL command. See the IBM TPFDF library for more information about the IBM TPFDF product.

**CVVA0003E INVALID TPFDF ZUDFM MESSAGE**

**Explanation:** A TPF Database Facility (TPFDF) command was entered that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter a valid TPFDF command.

See the IBM TPFDF library for more information about the IBM TPFDF product.

**CVX00055E SSNAME– *name* SSID– *id* IPL DEVICE ADDRESS– *addr* PRIME AND PRIME DUP CTK6 RECORD OUT OF SYNC — SS DISABLED**

**Where:**

*name*
The subsystem name.

*id* The subsystem ID.

*addr*
The device address.

**Segment Reference:** CVX0

**Explanation:** During restart, a mismatch occurred while comparing the prime and the prime dupe CTK6 records, specifically, the CTK6 update counter (CJ6UPD).

**System Action:** The subsystem referenced in the message is disabled.

**User Response:** Do the following:

1. Determine the cause of the mismatch.
2. Correct the problem.
3. IPL the TPF system again.

**CVX30050E SSNAME– *name* SSID– *id* IPL DEVICE ADDRESS– *addr* RETRIEVAL ERROR FOR CTK6 — SS DISABLED**

**Where:**

*name*
The subsystem name.

*id* The subsystem ID.

*addr*
The device address.

**Segment Reference:** CVX3

**Explanation:** During restart, keypoint 6 (CTK6) could not be retrieved.

**System Action:** The subsystem displayed in the message is disabled.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. IPL the TPF system again.

---

**CVX30055E SSNAME– *name* SSID– *id* IPL DEVICE ADDRESS– *addr* PRIME AND PRIME DUP CTK6 RECORD OUT OF SYNC — SS DISABLED**

**Where:**

*name*
The subsystem name.

*id* The subsystem ID.

*addr*
The device address.

**Segment Reference:** CVX3

**Explanation:** During TPF system restart, a mismatch occurred during the comparison of the prime and the prime dupe CTK6 records, specifically, the CTK6 update counter (CJ6UPD).

**System Action:** The subsystem displayed in the message is disabled.

**User Response:** Do the following:

1. Determine the cause of the mismatch.
2. Correct the problem.
3. IPL the TPF system again.

---

**CVZ10001I LAST EXTENT COPY OF CP KEYPTS FILED AT INDEX *xx***

**Where:**

*xx* The keypoint extent index.

**Segment Reference:** CVZB

**Explanation:** The time-initiated keypoints were filed successfully to the extent area specified.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* and *TPF Main Supervisor Reference* for more information.

---

**CVZ10002I LAST EXTENT COPY OF CP KEYPOINTS COPIED TO #KFBX*nnn***

**Where:**

**#KFBX*nnn***
The fallback extent fixed record type to which the control program (CP) keypoints have been copied, where *nnn* is a number in the range 0 – 254.

**Explanation:** Time-initiated keypoint copy has copied the system keypoints to the fallback extent definition specified. Respond to message IPLB0001A with the value *nnn* to use these keypoints to IPL the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* and *TPF Main Supervisor Reference* for more information about CP keypoints.

---

**CVZ10003E FALLBACK EXTENT #KFBX*nnn* NOT DEFINED**

**Where:**

**#KFBX*nnn***
The fallback extent fixed record type to which the TPF system is trying to copy the control program (CP) keypoints, where *nnn* is a number in the range 0 – 254.

**Explanation:** Time-initiated keypoint copy is trying to copy the TPF system keypoints to the fallback extent definition specified. The fixed records are not defined in the FACE table (FCTB). The NFBACK parameter of the system initialization program (SIP) RAM macro was coded with a value greater than specifed by *nnn*; therefore, the record type specified by #KFBX*nnn* should have been defined.

**System Action:** The keypoints are not copied and the specified fallback extent cannot be used by the IPL.

**User Response:** Do the following:

1. Confirm that the FACE table generator (FCTBG) is at the latest level.
2. Define the required fixed record type.
3. Rebuild and load the FCTB.

See *TPF Database Reference* and *TPF Main Supervisor Reference* for more information about CP keypoints.

---

**CVZ10004E EXTENT INDEX *hh* SPLIT IN #KEYPT**

**Where:**

*hh* The keypoint extent index.

**Explanation:** Time-initiated keypoint copy is trying to copy the TPF system keypoints to the extent index specified. The #KEYPT records where all or part of this extent is located are not part of the base extent of the #KEYPT definition (RAMFIL with PRIOR=1). This is not allowed.

**System Action:** The keypoints are not copied to the part of the specified extent that is outside the base extent. This fallback extent cannot be used by the IPL.

**User Response:** Do one the following:

- Increase the base extent for #KEYPT so that it is large enough to hold the required number of fallback extents.
- Reduce the number of fallback extents so that they fit in the base extent defined for #KEYPT.

Enter the ZKPTR command with the DISPLAY parameter specified to display the extents in the #KEYPT record definition.

See *TPF Database Reference* and *TPF Main Supervisor Reference* for more information about CP keypoints. See *TPF Operations* for more information about the ZKPTR command.

---

**CVZ60001A KEYPOINT POINTER RECORD CORRUPTED ALLOW REPLACEMENT WITH THE REBUILT RECORD ZKPTR REPLACE TO ABORT THE IPL ZKPTR CANCEL TO DISPLAY THE CORRUPTED RECORD ZKPTR DISPLAY**

**Explanation:** During system restart, it was determined that the keypoint pointer record was corrupted.

**System Action:** The TPF system is waiting for an operator command to replace the keypoint record and continue, to abort the IPL, or to display the corrupted keypoint record.

**User Response:** Do one of the following:

- To replace the file copy of the keypoint pointer record with the keypoint pointer record created by system restart, enter the ZKPTR command with the REPLACE parameter specified.
- To abort the IPL without updating the file copy of the keypoint pointer record, enter the ZKPTR command with the CANCEL parameter specified.
- To display the corrupted keypoint pointer record, enter the ZKPTR command with the DISPLAY parameter specified. After viewing the display, you must enter the ZKPTR command with either the REPLACE or CANCEL parameter specified.

See *TPF Operations* for more information about the ZKPTR command.

**CVZ60002A KEYPOINT POINTER RECORD OUT OF SYNC ALLOW REPLACEMENT WITH THE UPDATED RECORD ZKPTR REPLACE TO ABORT THE IPL ZKPTR CANCEL TO CONTINUE THE IPL WITHOUT FILING THE RECORD ZKPTR CONTINUE TO DISPLAY THE OUT OF SYNC RECORD ZKPTR DISPLAY**

**Explanation:** The keypoint pointer record on file does not match the current FACE table (FCTB) definition of the #KEYPT record.

**System Action:** The TPF system is waiting for an operator command to update the keypoint pointer record and continue, to abort the IPL, to continue without updating the keypoint pointer record, or to display the out-of-sync record.

**User Response:** Do one of the following:

- To replace the file copy of the keypoint pointer record with the keypoint pointer record updated by system restart, enter the ZKPTR command with the REPLACE parameter specified.
- To abort the IPL without updating the file copy of the keypoint pointer record, enter the ZKPTR command with the CANCEL parameter specified.
- To continue the IPL without updating the file copy of the keypoint pointer record, enter the ZKPTR command with the CONTINUE parameter specified.
- To display the corrupted keypoint pointer record, enter the ZKPTR command with the DISPLAY parameter specified. After viewing the display, you must enter the ZKPTR command with the REPLACE, CANCEL, or CONTINUE parameter specified.

See *TPF Operations* for more information about the ZKPTR command.

**CVZ60003E ZKPTR CONTINUE NOT ALLOWED WHEN KPTR IS CORRUPTED**

**Explanation:** The ZKPTR command with the CONTINUE parameter specified was entered in response to message CVZ60001A.

**System Action:** Message CVZ60001A is displayed again and system restart is suspended awaiting a response from the operator.

**User Response:** Respond as directed by message CYZ60001A.

See *TPF Operations* for more information about the ZKPTR command.

**CVZ60004I KEYPOINT POINTER RECORD FILED**

**Explanation:** The keypoint pointer record was updated on file in response to the ZKPTR command with the REPLACE parameter specified.

**System Action:** TPF system restart continues.

**User Response:** None.

See *TPF Operations* for more information about the ZKPTR command.

**CVZ60005W CONTINUE RESTART WITH NO UPDATE TO KEYPOINT POINTER RECORD**

**Explanation:** The ZKPTR command with the CONTINUE parameter specified was entered in response to message CVZ60002A. The keypoint pointer is record is out of sync with the #KEYPT definition in the FACE table (FCTB).

**System Action:** TPF system restart continues.

**User Response:** None.

See *TPF Operations* for more information about the ZKPTR command.

**CVZ60006T RESTART ABORTED**

**Explanation:** The ZKPTR command with the CANCEL parameter specified was entered in response to message CVZ60001A or CVZ60002A. The keypoint pointer record is corrupted or out of sync with the #KEYPT definition in the FACE table (FCTB).

**System Action:** System error 005100 is issued and the system restart entry control block (ECB) exits.

**User Response:** You must re-IPL the TPF system and respond appropriately to message CVZ60001A or CVZ60002A when it is issued by system restart.

See *TPF Operations* for more information about the ZKPTR command.

**CVZB0002E NO DISK AVAILABLE FOR TIME INITIATED CP KEYPOINT COPY**

**Segment Reference:** CVZB

**Explanation:** No fallback disk was available for the time-initiated keypoint copy.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* and *TPF Main Supervisor Reference* for more information.

**CVZB0001I LAST FALLBACK COPY OF CP KEYPOINTS ON SYMBOLIC MODULE:** *mmm* **DEVICE** *dddd*

**Where:**

*mmm*
The symbolic module number.

*dddd*
The device address.

**Segment Reference:** CVZB

**Explanation:** The time-initiated keypoints were filed successfully to the module and device specified.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* and *TPF Main Supervisor Reference* for more information.

# CWAL–CYC6

**CWAL0001E INVALID SCK RECORD** *xxxx*

**Where:**

*xxxx*
The system communication keypoint record containing the data that is not valid.

**Explanation:** A non-SNA line restart detected errors in the TPF system communication keypoint (SCK) record definitions. Either the SCK records were corrupted or input that is not valid was used when creating the SCK pilot tape.

**System Action:** The CWAL0001E error message is generated and the definitions that are not valid are ignored.

**User Response:** Do one of the following:

- If a new SCK pilot tape was loaded, then verify that the job used to create the tape ran successfully.
- If the online records were corrupted, the SCK pilot tape should be loaded again.

See *TPF System Generation* for more information.

**CYAA0072E** *pgm text* **INVLD FUNC. WHEN SYSTEM IS CYCLING, RETRY LATER**

**Where:**

*pgm text*
The text that was issued in the command.

**Explanation:** You entered a pool command but the TPF system is cycling between states.

**System Action:** None.

**User Response:** Enter the command again when the cycle is completed.

See *TPF Operations* for more information about the file pool commands.

**CYAB0001W REQ PERM TO USE POOL** *xxx* **DEVICE** *yyyy zzzzzzzz* **MINTUES LEFT BEFORE USE**

**Where:**

*xxx* The pool type.

*yyyy*
The device type.

*zzzzzzzz*
The time in minutes.

**Segment Reference:** CYAB

**Explanation:** The directories for the pool type and device specified in the message, which are currently in main storage, were not aged sufficiently for them to be used again. They can be used again when they are aged sufficiently or forced by entering the ZGFSP RCY command.

**System Action:** Any requests for this type of pool are dispensed from the primary or secondary fallback section until a forced reuse is issued or adequate time passes.

**User Response:** Have your system programmer determine whether a forced reuse should be issued.

See *TPF Operations* for more information about the ZGFSP RCY command.

**CYAC0086E PROCESSOR NOT POOL OWNER**

**Explanation:** During processing of a pool command it was determined that the message was entered on a processor other than the processor that owns pools.

**System Action:** None.

**User Response:** Have your system programmer determine whether pool ownership or the processor designated to run the task must be changed.

See *TPF Database Reference* for more information.

**CYAC0087E PROT RETRIEVAL ERROR**

**Explanation:** During processing of a pool command an error occurred while trying to retrieve the processor ownership table.

**System Action:** None.

**User Response:** Have your system programmer why the

processor ownership table was not retrieved.

See *TPF Database Reference* for more information.

---

**CYAC0088E PROC(S) NOT IN 1052 STATE**

**Explanation:** A pool function was tried for which the TPF system must be in 1052 state and it is not.

**System Action:** None.

**User Response:** Do one of the following:

- If a command caused the error, bring the TPF system to the proper state before entering the command again.
- If a pool generation function caused the error, then TPF system state change is disabled and the processor is hung in the cycle-up process. Do not try a pool generation again on this or any other processor in the TPF system until this processor is IPLed and the TPF system is brought to the proper state.

See *TPF Database Reference* for more information.

---

**CYAE0005I POOL RPFS-PERFORMED**

**Explanation:** This is the normal response to the ZPOOL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPOOL commands.

---

**CYAE0009I** *pgm text* **FUNCTION ALREADY ACTIVE, RETRY LATER**

**Where:**

*pgm text*
The text that was issued in the command.

**Explanation:** The operator entered a pool command for a special pool function (recoup, directory capture, directory update, pool counts reconcile, and so on) that is already active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the file pool commands.

---

**CYAE0072E** *pgm text* **INVLD FUNC. WHEN SYSTEM IS CYCLING, RETRY LATER**

**Where:**

*pgm text*
The text that was issued in the command.

**Explanation:** The operator entered a pool command but the TPF system is cycling between states.

**System Action:** None.

**User Response:** Enter the command again when the cycle is complete.

See *TPF Operations* for more information about the file pool commands.

---

**CYAE0074E** *pgm text*—**NO SON POOLS**

**Where:**

*pgm text*
The text that was issued in the command.

**Segment Reference:** CYE3, CYAE

**Explanation:** The operator entered a pool command but the pool configuration mask shows that there are no pools in the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the file pool commands.

---

**CYAE0077E** *pgm text*—**INVALID OPTION**

**Where:**

*pgm text*
The text that was issued in the command.

**Explanation:** The operator entered a pool command with an option that is not valid.

**System Action:** None.

**User Response:** Enter the command again.

See *TPF Operations* for more information about the file pool commands.

---

**CYAE0088E PROC(S) NOT IN 1052 STATE**

**Explanation:** A pool related command was entered for which the TPF system must be in 1052 state and it is not.

**System Action:** None.

**User Response:** Do the following:

1. Bring the TPF system to the proper state.
2. Enter the command again.

See *TPF Database Reference* for more information.

---

**CYAE0092E MUTUALLY EXCLUSIVE POOL FUNCTION ALREADY ACTIVE, RETRY LATER**

**Explanation:** Recoup, directory capture, pool reconcile, directory update, pool area deactivation, ZGFSP set or display, or various miscellaneous functions that are defined as mutually exclusive are being attempted to be run concurrently.

**System Action:** None.

**User Response:** Defer running the desired function until other mutually exclusive pool functions are complete.

See *TPF Database Reference* for more information.

---

**CYAR0083E** *devx xyz dnnnnn*—**CHECK SUM ERROR**

**Where:**

*devx*
The device type.

*xyz* One of the following: SLT, SST, SDP, LLST, LST, LDP, 4LT, 4ST, 4DP, or 4D6.

*nnnnn*
The record ordinal number of the directory record.

**Note:** The device type, directory ordinal, and pool type may be overwritten by an unknown ordinal. This indicates that the caller of the message writing segment failed to supply a correct ordinal number.

**Explanation:** During directory retrieval, a directory check sum that is not valid was found. The directory could not be used.

**System Action:** None.

**User Response:** Have your system programmer determine why the directory check sum was not successful.

See *TPF Database Reference* for more information.

---

**CYAR0089E** *devx xyz dnnnnn*—**DIRECTORY BASE ORDINAL NUMBER VALIDATION ERROR**

**Where:**

*devx*
The device type.

*xyz* One of the following: SLT, SST, SDP, LLT, LST, LDP, 4LT, 4ST, 4DP, or 4D6.

*nnnnn*
The record ordinal number of the directory record.

**Note:** The device type, directory ordinal, and pool type may be overwritten by an unknown ordinal. This indicates that the caller of the message writing segment failed to supply a correct ordinal number.

**Explanation:** During directory retrieval, an error was detected when trying to compute the file address for the starting pool ordinal number in this directory. The directory could not be used.

**System Action:** None.

**User Response:** Have your system programmer determine why the directory base ordinal number validation was not successful.

See *TPF Database Reference* for more information.

---

**CYA00091E UNABLE TO READ CTK9**

**Explanation:** During pool cycle up, reorder, or ZGFSP set and display functions, an input/output (I/O) error occurred while trying to retrieve keypoint 9 from the online packs.

**System Action:** None.

**User Response:** Have your system programmer determine why the I/O error occurred while reading keypoint 9.

See *TPF Database Reference* for more information.

---

**CYA00093E INVALID SON POOL RCDS (SEE ZPOOL)**

**Explanation:** During pool cycle up, the pool descriptor record indicated a pool format that is not valid.

**System Action:** None.

**User Response:** See your system programmer for more information.

See *TPF Database Reference* for more information.

---

**CYA00096E CYE0-FACE ERROR** *x*

**Where:**

*x* FACS error type. If 1, then FACS ID INVALID. If 2, then FACS INPUT ORDINAL NUMBER OUTSIDE RANGE.

**Explanation:** During pool cycle up, directory reorder, or ZGFSP display or modify functions, FACS resolution for the pool descriptor record, a pool directory record, or a short term directory control record failed due to entering FACS with a record ID that is not valid or a record ordinal number that is out of the range of that record type.

**System Action:** None.

**User Response:** Have your system programmer determine why there was a FACS error.

See *TPF Database Reference* for more information.

---

**CYA00097E UNABLE TO READ CTKA**

**Explanation:** During pool cycle up, a retrieval error occurred while trying to retrieve keypoint A.

**System Action:** None.

**User Response:** Have your system programmer determine why there was a keypoint A retrieval error.

See *TPF Database Reference* for more information.

---

**CYA00098E UNABLE TO READ CYPDR**

**Explanation:** During pool cycle up, ZGFSP display, or ZGFSP set, the TPF system failed to retrieve the pool descriptor record.

**System Action:** None.

**User Response:** Have your system programmer determine why the pool descriptor record could not be retrieved.

See *TPF Operations* for more information about the ZGFSP command. Also see *TPF Database Reference* for more information.

---

**CYA10085E UNABLE TO FILE CTK9**

**Explanation:** During pool cycle up, a file operation of keypoint 9 through CYYA failed.

**System Action:** None.

**User Response:** Have your system programmer determine why the filing of keypoint 9 was not successful.

See *TPF Database Reference* for more information.

**CYA10091E UNABLE TO READ CTK9**

**Explanation:** During pool cycle up, the reorder or ZGFSP set and display functions, an input/output (I/O) error occurred while trying to retrieve keypoint 9 from the online packs.

**System Action:** None.

**User Response:** Have your system programmer determine why an I/O error occurred while reading keypoint 9.

See *TPF Database Reference* for more information.

**CYA10095E POOL/DIRECTORY COUNTS ARE INVALID**

**Explanation:** During pool cycle up, the CY3CNT count field of an online directory was found to be negative or during directory reorder the pool section counts CY2PCT was found to be less than the new directory's counts CY3CNT or during directory reorder the pool section counts do not show zero but there are no available directories to reorder.

**System Action:** None.

**User Response:** Have your system programmer determine why the pool counts were not valid.

See *TPF Database Reference* for more information.

**CYA20001I POOL TYPE *pool* DEVICE *dev* STPCR INITIALIZED**

**Where:**

*pool*
The short-term pool type.

*dev* The device type.

**Explanation:** During pool cycle-up processing, the current processor determined that the short-term processor control records (STPCRs) for the pool type and device needed to be initialized.

**System Action:** The STPCRs for the pool type and device are initialized for the current processor. This is a normal action following a pool generation or reallocation. The STPCRs of all other processors and pool sections are unchanged.

**User Response:** None.

**CYA20084E STCCR/STPCR SHORT TERM DIRECTORY CONTROL RECORD IN ERROR**

**Explanation:** During pool cycle up or short term reorder, a logic error in the short term directory control record for a given short term pool section precludes directory selection.

**System Action:** None.

**User Response:** Have your system programmer determine why the logical error in the short term directory control record or short term processor control record occurred. There may be a problem with the structure or the set size may be too large.

See *TPF Database Reference* for more information.

**CYA20085E UNABLE TO FILE CTK9**

**Explanation:** During pool cycle up, a file operation of keypoint 9 (CTK9) through CYYA failed.

**System Action:** None.

**User Response:** Have your system programmer determine why the filing of keypoint 9 was not successful.

See *TPF Database Reference* for more information.

**CYA20090E UNABLE TO FIND/FILE STCCR/STPCR**

**Explanation:** During pool cycle up or reorder of a short term pool, an input/output (I/O) error occurred while trying to read the short term master control records (CY$CR) or short term processor control records (ICY$PR).

**System Action:** None.

**User Response:** Have your system programmer determine why an I/O error occurred.

See *TPF Database Reference* for more information.

**CYA20096E CYE0-FACE ERROR *x***

**Where:**

*x* FACS error type. If 1, then FACS ID INVALID. If 2, then FACS INPUT ORDINAL NUMBER OUTSIDE RANGE.

**Explanation:** During pool cycle up, directory reorder, or ZGFSP display or modify functions, FACS resolution for the pool descriptor record, a pool directory record or a short term directory control record failed due to entering FACS with a record ID that is not valid or a record ordinal number that is out of the range of that record type.

**System Action:** None.

**User Response:** Have your system programmer determine why a FACS error occurred.

See *TPF Database Reference* for more information.

**CYA30084E STCCR/STPCR SHORT TERM DIRECTORY CONTROL RECORD IN ERROR**

**Explanation:** During pool cycle up or short term reorder, a logic error in the short term directory control record for a given short term pool section precludes directory selection.

**System Action:** None.

**User Response:** Have your system programmer determine why there was a logical error in the short term directory control record or short term processor control record. There may be problem with the structure or the set size may be too large.

See *TPF Database Reference* for more information.

**CYA40085E UNABLE TO FILE CTK9**

**Explanation:** During pool cycle up, a file operation of keypoint 9 through CYYA failed.

**System Action:** None.

**User Response:** Have your system programmer determine

why the filing of keypoint 9 was not successful.

See *TPF Database Reference* for more information.

---

**CYA90004I** *devx xyz dnnnnn*—**ZEROED DURING SKIPPING**

**Where:**

*devx*
The device type.

*xyz* One of the following: SLT, SST, SDP, LLT, LST, LDP, 4ST, 4LT, 4DP, or 4D6.

*nnnnn*
Record ordinal number of the directory record.

**Note:** The device type, directory ordinal, and pool type may be overwritten by UNKNOWN ORDINAL. This indicates that the caller of the message writing segment failed to supply a correct ordinal number.

**Explanation:** During pool cycle up and after an unplanned shutdown, a directory was zeroed as a result of applying SKP and KUL.

**System Action:** None.

**User Response:** See your system programmer for more information.

See *TPF Database Reference* for more information.

---

**CYA90089E FIND/FILE ERROR ON CYSDR**

**Explanation:** During pool cycle up or keypointing of a short term pool directory, an input/output (I/O) error occurred while trying to read or write the short term directory keypoint record.

**System Action:** None.

**User Response:** Have your system programmer determine why there was an I/O failure while reading or writing the short term directory keypoint.

See *TPF Database Reference* for more information.

---

**CYA90096E CYE0-FACE ERROR** *x*

**Where:**

*x* FACS error type. If 1, then FACS ID INVALID. If 2, then FACS INPUT ORDINAL NUMBER OUTSIDE RANGE.

**Explanation:** During the pool cycle up, directory reorder, or ZGFSP display or modify functions, FACS resolution for the pool descriptor record, a pool directory record or a short term directory control record failed due to entering FACS with a record ID that is not valid or a record ordinal number that is out of the range of that record type.

**System Action:** None.

**User Response:** Have your system programmer determine why there was a FACS error.

See *TPF Database Reference* for more information.

---

**CYB00082E** *devx xyz dnnnnn*—**READ/WRITE ERROR ON CYSDR**

**Where:**

*devx*
The device type.

*xyz* One of the following: SLT, SST, SDP, LLT, LST, LDP, 4ST, or 4LT, 4DP, or 4D6.

*nnnnn*
Record ordinal number of the directory record.

**Note:** The device type, directory ordinal, and pool type may be overwritten by UNKNOWN ORDINAL. This indicates that the caller of the message writing segment failed to supply a correct ordinal number.

**Explanation:** During pool cycle up or reorder, a directory read or write operation failed.

**System Action:** None.

**User Response:** Have your system programmer determine why there was a read/write failure.

See *TPF Database Reference* for more information.

---

**CYB00085E UNABLE TO FILE CTK9**

**Explanation:** During pool cycle up, a file operation of keypoint 9 through CYYA failed.

**System Action:** None.

**User Response:** Have your system programmer determine why the filing of keypoint 9 was not successful.

See *TPF Database Reference* for more information.

---

**CYB00091E UNABLE TO READ CTK9**

**Explanation:** During the pool cycle up, reorder, or ZGFSP set and display functions, an input/output (I/O) error occurred while trying to retrieve keypoint 9 from the online packs.

**System Action:** None.

**User Response:** Have your system programmer to determine why there was an I/O error while trying to read keypoint 9.

See *TPF Database Reference* for more information.

---

**CYB00096E CYE0-FACE ERROR** *x*

**Where:**

*x* FACS error type. If 1, then FACS ID INVALID. If 2, then FACS INPUT ORDINAL NUMBER OUTSIDE RANGE.

**Explanation:** During the pool cycle up, directory reorder, or ZGFSP display or modify functions, FACS resolution for the pool descriptor record, a pool directory record or a short term directory control record failed due to entering FACS with a record ID that is not valid or a record ordinal number that is out of the range of that record type.

**System Action:** None.

**User Response:** Have your system programmer determine why there was a FACS error.

See *TPF Database Reference* for more information.

**CYCL0001I CYCLE TO *xxxx* — STARTED**

**Where:**

*xxxx*
The TPF system state (1052, NORM, CRAS, MESW, UTIL).

**Explanation:** This message is issued in response to a request to change the TPF system to a specific state. Prior to this message, all critical utilities associated with cycling were checked.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command and for a description of the different TPF system states.

**CYCL0001T INVALID MESSAGE FORMAT**

**Explanation:** This may indicate one of the following errors:

- A parameter that is not valid
- Option parameters that are not valid
- A subsystem name that is more than four characters long
- The number of subsystems specified are more than 10
- No subsystem name was specified with the INC or EXC option.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

**CYCL0002T STATE CHANGE NOT ALLOWED — BSS CYCLING**

**Explanation:** Subsystems cannot be cycled when the basic subsystem (BSS) is cycling in a Multiple Database Function (MDBF) environment.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

**CYCL0003T SYSTEM IN RESTART MODE**

**Explanation:** The TPF system is in restart mode.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

**CYCL0004T BSS STATE MUST BE THE HIGHEST IN THE SYSTEM CHECK INPUT MESSAGE/STATE OF SS(S)**

**Explanation:** The requested cycle TO state will make the start of the subsystems higher than the TPF system state of the basic subsystem (BSS).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

**CYCL0006T UNABLE TO CYCLE BSS/SS(S) — CYCLE TERMINATED**

**Explanation:** During cycle down, one or more subsystems could not be cycled to requested state so the basic subsystem (BSS) cycle down ended. In cycle up, because of an error in cycling BSS to the requested state, cycle up of the remainder of the subsystems is ended.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

**CYCL0007T ALL, EXC, OR INC OPTION NOT ALLOWED FROM NON-BSS**

**Explanation:** There is a restriction that these options must be used with the prefix of the basic subsystem (BSS) or without a prefix.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

**CYCL0008T INVALID SUBSYSTEM NAME LIST**

**Explanation:** The subsystem name list was not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

**CYCL0009T BSS CYCLE UP/DOWN NOT ALLOWED — SUBSYSTEM CYCLING**

**Explanation:** The basic subsystem (BSS) cycling up or down was not allowed because the subsystem is cycling.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

**CYCL0010T NO SS CYCLED CHECK INPUT MESSAGE/SYSTEM STATE OF SS(S)**

**Explanation:** No subsystem requires a state change. One of the following errors occurred:

- The command excluded all the active subsystems.
- All the requested subsystems are in already in the desired TPF system state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

**CYCL0011T STATE CHANGE DISABLED**

**Segment Reference:** CVCY, CVCI, CVCO

**Explanation:** The state change was disabled.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZCYCL command.

**CYCL0012T WAIT FOR FORCED POOL CYCLE UP TO COMPLETE, THEN RE-ENTER ZCYCL REQUEST**

**Explanation:** The ZCYCL request cannot be processed while a forced pool cycle up is in progress.

**System Action:** None.

**User Response:** Do the following:

1. Wait for the forced pool cycle up to complete.
2. Enter the ZCYCL command again.

See *TPF Operations* for more information about the ZCYCL command.

**CYCL0013T CYCLE UP NOT ALLOWED-ZRIPL IN PROGRESS**

**Explanation:** The ZCYCL request cannot be processed while a TPF system re-ipl is in progress.

**System Action:** None.

**User Response:** Do the following:

1. Wait for the TPF system IPL to complete.
2. Enter the ZCYCL command again.

**CYC00001W POOL TYPE *xxx* DEVICE *yyyy* DIRECTORIES *fffffff* THRU *lllllll* COUNTS *nnnnnnnn* REJECTED**

**Where:**

*xxx* The pool type.

*yyyy*
The device address.

*fffffff*
The first set member directory ordinal.

*lllllll*
The last set member directory ordinal.

*nnnnnnnn*
The total number of available addresses in set.

**Explanation:** The directories specified in the message were rejected during the course of a reorder. The counts in the set are not high enough to meet the user tunable rejection criteria (specified through ZGFSP command for modifying rejection level). This message is applicable to long-term pools only.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information.

**CYC00002W POOL TYPE *xxx* DEVICE *yyyy* REORDER FAILURE DUE TO TOO LARGE A SET SIZE**

**Where:**

*xxx* The pool type.

*yyyy*
The device address.

**Explanation:** The new set size, as designated by the ZGFSP command, is large enough to cause the active and standby sets of a specific processor to always overlap.

**System Action:** None.

**User Response:** Enter the ZGFSP command to reduce the new set size. This will cause GRFS to drive another reorder.

See *TPF Database Reference* for more information.

**CYC00003I POOL TYPE *xxx* DEVICE *yyyy* DIRECTORIES *fffffff* THRU *lllllll* COUNTS *nnnnnnnn* IN USE**

**Where:**

*xxx* The pool type.

*yyyy*
The device address.

*fffffff*
The first set member directory ordinal.

*lllllll*
The last set member directory ordinal.

*nnnnnnnn*
The total number of available addresses in set.

**Explanation:** The directories specified in the message were reordered successfully and are in use. This message is applicable to long-term pools only.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information.

**CYC00004W POOL TYPE *type* DEVICE *addr* TOTAL NUMBER OF POOL SETS REJECTED DURING THIS REORDER *num***

**Where:**

*type*
The pool type.

*addr*
The device address.

*num*
The number of pool sets excluded during reorder.

**Explanation:** The number of pool sets specified were excluded during reorder because there were not enough available records within the set.

**System Action:** None.

**User Response:** If an excessive number of pool sets are rejected, do one of the following:

- Enter the ZGFSP command to define the minimum number of of available records needed in a set.
- Run recoup.
- Do a pool directory update (PDU).

See *TPF Operations* for more information about the ZGFSP commands. See *TPF Database Reference* for more information about reorder, recoup, and PDU.

**CYC00005W C2EC FACE ERROR**

**Explanation:** The ZSDEA command was entered but an error condition was detected by a FACE-type call for the online directory deactivation control (#$C2EC) record.

**System Action:** The command is rejected.

**User Response:** Check the FACE table for #$C2EC.

See *TPF Operations* for more information about the ZSDEA command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

**CYC00006W C2EC FIND ERROR**

**Explanation:** The ZSDEA command was entered but an error condition was detected while trying to find the online directory deactivation control (#$C2EC) record.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

**CYC00085E UNABLE TO FILE CTK9**

**Explanation:** During pool cycle up, a file operation of keypoint 9 through CYYA failed.

**System Action:** None.

**User Response:** Have your system programmer determine why the filing of keypoint 9 was not successful.

See *TPF Database Reference* for more information.

**CYC00091E UNABLE TO READ CTK9**

**Explanation:** During the pool cycle up, reorder, or ZGFSP set and display functions, an input/output (I/O) error occurred while trying to retrieve keypoint 9 from the online packs.

**System Action:** None.

**User Response:** Have your system programmer determine why the filing of keypoint 9 was not successful.

See *TPF Database Reference* for more information.

**CYC00094E LONG-TERM POOL SECTION DEPLETED**

**Segment Reference:** CYE0, CYA9, and CYC0

**Explanation:** One of the following errors occurred:

- During the reorder process, the counts in the pool section were found to be zero, making no reorder possible.
- During pool cycle, up no available directories were found.

**System Action:** None.

**User Response:** See your system programmer for more information. This should not occur on the online system. A recoup or directory update needs to be done immediately to recover the pool addresses.

See *TPF Database Reference* for more information.

**CYC00095E POOL/DIRECTORY COUNTS ARE INVALID**

**Explanation:** One of the following errors occurred:

- During pool cycle up, the CY3CNT count field of an online directory was found to be negative.
- During directory reorder, the CY2PCT counts in the pool section were found to be less than the new directory's counts CY3CNT.
- During a directory reorder, the pool section counts do not show zero but there are no available directories to reorder.

**System Action:** None.

**User Response:** Have your system programmer determine why the pool counts were not valid.

See *TPF Database Reference* for more information.

**CYC10004I POOL TYPE *xxx* DEVICE *yyyy* COUNTS *nnnnnnnn* IN USE**

**Where:**

*xxx* The pool type.

*yyyy*
The device address.

*nnnnnnnn*
The total number of available addresses in the set.

**Explanation:** A short-term section was reordered successfully and is in use. This message is applicable to short-term pools only.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information.

**CYC10005A REQ PERM TO USE POOL *xxx* DEVICE *yyyy* *mmmmmmmm* MINUTES LEFT BEFORE USE**

**Where:**

*xxx* The pool type.

*yyyy*
The device address.

*mmmmmmmm*
The time in minutes that must elapse before the TPF system puts the set into use.

**Explanation:** A short-term section was reordered successfully but is not in use because the directories were not aged long enough. This message is applicable to short-term pools only.

**System Action:** None.

**User Response:** The operator can force an early reuse by entering the ZGFSP RCY command.

See *TPF Operations* for more information about the ZGFSP RCY command and other file support commands. See *TPF Database Reference* for more information.

---

**CYC10085E UNABLE TO FILE CTK9**

**Explanation:** During pool cycle up, a file operation of keypoint 9 through CYYA failed.

**System Action:** None.

**User Response:** Have your system programmer determine why the filing of keypoint 9 was not successful.

See *TPF Database Reference* for more information.

---

**CYC10090E UNABLE TO FIND/FILE STCCR/STPCR**

**Explanation:** During pool cycle up or reorder of a short term pool, an input/output (I/O) error occurred while trying to read the short term master control records (CY$CR) or short term processor control records (ICY$PR).

**System Action:** None.

**User Response:** Have your system programmer determine why there was an I/O failure.

See *TPF Database Reference* for more information.

---

**CYC10091E UNABLE TO READ CTK9**

**Explanation:** During the pool cycle up, reorder, or ZGFSP set and display functions, an input/output (I/O) error occurred while trying to retrieve keypoint 9 from the online packs.

**System Action:** None.

**User Response:** Have your system programmer determine why there was an I/O error while trying to read keypoint 9.

See *TPF Database Reference* for more information.

---

**CYC10096E CYE0-FACE ERROR *x***

**Where:**

*x* FACS error type. If 1, then FACS ID INVALID. If 2, then FACS INPUT ORDINAL NUMBER OUTSIDE RANGE.

**Explanation:** During the pool cycle up, directory reorder, or ZGFSP display or modify functions, FACS resolution for the pool descriptor record, a pool directory record, or a short-term directory control record failed due to entering FACS with a record ID that is not valid or a record ordinal number that is out of the range of that record type.

**System Action:** None.

**User Response:** Have your system programmer determine why there was a FACS error.

See *TPF Database Reference* for more information.

---

**CYC20089E FIND/FILE ERROR ON CYSDR**

**Explanation:** During pool cycle up or keypointing of a short-term pool directory, an input/output (I/O) error occurred while trying to read or write the short-term directory keypoint record.

**System Action:** None.

**User Response:** Have your system programmer determine why there was an I/O failure while reading or writing the short-term directory keypoint.

See *TPF Database Reference* for more information.

---

**CYC30089E FIND/FILE ERROR ON CYSDR**

**Explanation:** During pool cycle up or keypointing of a short-term pool directory, an input/output (I/O) error occurred while trying to read or write the short-term directory keypoint record.

**System Action:** None.

**User Response:** Have your system programmer determine why there was an I/O failure while reading or writing the short-term directory keypoint.

See *TPF Database Reference* for more information.

---

**CYC60001E POOL TYPE *pooltype* DEVICE *devaddr* ALREADY IN USE**

**Where:**

*pooltype*
The type of pool file.

*devaddr*
The device address.

**Explanation:** The operator requested early reuse of a short-term pool section by entering the ZGFSP command but the section is already in use.

**System Action:** None.

**User Response:** Check that the command was entered for the proper section and that the TPF system did not put the section in use on its own. This can be done by checking the system console.

See *TPF Database Reference* for more information.

---

**CYC60002I POOL TYPE** *pooltype* **DEVICE** *devaddr* **COUNTS** *availaddr* **IN USE**

**Where:**

*pooltype*
The type of pool file.

*devaddr*
The device address.

*availaddr*
The number of addresses available.

**Explanation:** This is the normal response to the ZGFSP command with the RCY parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZGFSP commands. Also see *TPF Database Reference* for more information.

**CYC60090E UNABLE TO FIND/FILE STCCR/STPCR**

**Explanation:** During the short term pool reuse, an input/output (I/O) error occurred while trying to read the short term master control records (CY$CR) or short term processor control records (ICY$PR).

**System Action:** None.

**User Response:** Have your system programmer determine why there was an I/O failure.

See *TPF Database Reference* for more information.

**CYC60096E CYE0-FACE ERROR** *x*

**Where:**

*x* FACS error type. If 1, then FACS ID INVALID. If 2, then FACS INPUT ORDINAL NUMBER OUTSIDE RANGE.

**Explanation:** During the pool cycle up, directory reorder, or ZGFSP display or modify functions, FACS resolution for the pool descriptor record, a pool directory record, or a short-term directory control record failed due to entering FACS with a record ID that is not valid of a record ordinal number that is out of the range of that record type.

**System Action:** None.

**User Response:** Have your system programmer determine why there was a FACS error.

See *TPF Database Reference* for more information.

# CYEA–CZSA

**CYEA0022I SUBSYSTEM STORAGE PHYSICALLY ENABLED ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) ID (SSID).

**Explanation:** A state change interrupt was received from the 3990 RCS SSID specified in the message, indicating that the subsystem cache is no longer disabled for maintenance.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding reset for the 3990 RCS SSID specified in the message, if it is no longer degraded.

**User Response:** Have your system support personnel determine whether corrective action is required to enable the subsystem cache for use.

**CYEA0023I NONVOLATILE STORAGE PHYSICALLY ENABLED ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) ID (SSID).

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystem (RCS) ID (SSID) specified in the message, indicating that the nonvolatile storage (NVS) is no longer disabled for maintenance on the 3990 RCS SSID specified in the message.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding reset for the 3990 RCS SSID specified in the message, if it is no longer degraded.

**User Response:** Have your system support personnel determine whether corrective action is required to enable the nonvolatile storage (NVS) for use.

**CYEA0024I FAST WRITE FUNCTIONS RESUMED ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) ID (SSID).

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystem (RCS) ID (SSID) specified in the message, indicating that the fast-write suspend state is no longer active on the 3990 RCS SSID specified in the message. Fast-write function were resumed. Fast-write functions were resumed during RCS shutdown processing.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding reset for the RCS SSID specified in the message, if it is no longer degraded.

**User Response:** None.

**CYEA0025W FAST WRITE FUNCTIONS SUSPENDED ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) ID (SSID).

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystem (RCS) ID (SSID) specified in the message, indicating that the fast-write function was suspended on the 3990 RCS SSID specified in the message. Fast-write functions are suspended during RCS shutdown processing.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding activated for the 3990 RCS SSID specified in the message.

**User Response:** See your system support personnel if an RCS

shutdown is not currently active. This may indicate a status change initiated by a non-TPF attached system.

---

**CYEA0026I IML DEVICE AVAILABLE ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) ID (SSID).

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystem (RCS) ID (SSID) specified in the message, indicating that the initial machine load (IML) device for the 3990 RCS SSID specified in the message is now available.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding reset for the 3990 RCS SSID specified in the message, if it is no longer degraded.

**User Response:** None.

---

**CYEA0027I CACHE FAST WRITE ACTIVATED ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystem (RCS) SSID that is specified in the message, indicating that the cache fast-write capability is now activated for the 3990 RCS SSID specified in the message.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding reset for the 3990 RCS SSID specified in the message, if it is no longer degraded.

**User Response:** Have your system support personnel determine whether corrective action is required to use the cache fast-write function in the subsystem.

---

**CYEA0028W NONVOLATILE STORAGE BATTERY DEFECTIVE ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystem (RCS) SSID specified in the message, indicating that the nonvolatile storage (NVS) battery is defective on the 3990 RCS SSID specified in the message.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding activated for the 3990 RCS SSID specified in the message.

**User Response:** Have your system support personnel determine whether corrective action is required to repair or replace the defective nonvolatile storage (NVS) battery.

---

**CYEA0029A CACHING TERMINATED ON RCS SSID** *ssss* **DUE TO SUBSYSTEM STORAGE MALFUNCTION.**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystm (RCS) SSID specified in the message, indicating that caching was ended due to an error in the 3990 RCS SSID specified in the message.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding activated for the 3990 RCS SSID specified in the message.

**User Response:** See your IBM service representative to address this error condition.

---

**CYEA0030A DASD FAST WRITE TERMINATED ON RCS SSID** *ssss* **DUE TO NONVOLATILE CACHE MALFUNCTION.**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystem (RCS) SSID specified in the message, indicating that DASD fast-write capability is ended due to an error in the 3990 RCS SSID specified in the message.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding activated for the 3990 RCS SSID specified in the message.

**User Response:** See your IBM service representative to address this error condition.

---

**CYEA0051W POSSIBLE CACHE FAST WRITE DATA LOSS FOR RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystem (RCS) SSID specified in the message, indicating that the cache fast-write ID (CFWID) was changed. Cache fast-write data may be lost from this action.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding activated for the 3990 RCS SSID specified in the message.

**User Response:** Have your system support personnel determine whether corrective action is required to restore or recreate any lost cache fast-write data.

---

**CYEA0053W CACHING DEACTIVATED ON RCS SSID** *ssss* **DUE TO EXPLICIT HOST REQUEST**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystem (RCS) ID (SSID) specified in the message, indicating that the caching capability was ended due to an explicit host request for the 3990 RCS SSID specified in the message.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding activated for the 3990 RCS SSID specified in the message.

**User Response:** Ensure this condition was expected as a result of a prior ZBUFC ALLOCATE IMPLEMNT command request.

**CYEA0054W CACHE FAST WRITE DEACTIVATED ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystem (RCS) ID (SSID) specified in the message, indicating that the fast-write capability was ended due to an explicit host request for the 3990 RCS SSID specified in the message.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding activated for the 3990 RCS SSID specified in the message.

**User Response:** Ensure this condition was expected as a result of a prior ZBUFC FILE command request.

**CYEA0055W NONVOLATILE CACHE DEACTIVATED ON RCS SSID** *ssss* **DUE TO EXPLICIT HOST REQUEST.**

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystem ID (SSID) specified in the message, indicating that the nonvolatile cache was ended due to an explicit host request.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding activated for the 3990 RCS SSID specified in the message.

**User Response:** Ensure this condition was expected as a result of a prior ZBUFC FILE command request.

**CYEA0058W CACHING DEACTIVATED FOR DEVICE** *dddd* **ON RCS SSID** *ssss*

**Where:**

*dddd*
Represents a 3990 Record Cache device address.

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystem ID (SSID) that is specified in the message, indicating that the caching capability was ended for the device specified in the message due to an explicit host request.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding activated for the 3990 RCS SSID specified in the message.

**User Response:** This is not an expected condition. Enter the ZBUFC ENABLE command to enable caching again, if required.

**CYEA0083I CACHING ACTIVE ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystem ID (SSID) that is specified in the message, indicating that the subsystem storage is available for caching due to an explicit host request or a resetting event in the control unit.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding reset for the 3990 RCS SSID specified in the message if it is no longer degraded.

**User Response:** None.

**CYEA0084I CACHING IS PENDING ACTIVE ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystem ID (SSID) that is specified in the message, indicating that the subsystem storage is being made available for caching due to an explicit host request or a resetting event in the control unit.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding reset for the 3990 RCS SSID specified in the message if it is no longer degraded.

**User Response:** None.

**CYEA0085W CACHE SUSPENDED ON RCS SSID** *ssid*

**Where:**

*ssid* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 Record Cache Subsystem ID (SSID) that is specified in the message, indicating that the the caching status is suspended due to a request to make subsystem storage unavailable while users of the concurrency filter lock facility (CFLF) are connected to lock partitions.

This condition results from:

- A ZBUFC SETCACHE command that was entered in an attempt to deactivate subsystem storage
- An inadvertent attempt to make subsystem storage unavailable through the 3990 support facility by service personnel.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding activated for the 3990 RCS SSID specified in the message due to the loss of caching capability. In this state, lock entities in the subsystem are preserved and lock activity is allowed but further caching of data records is denied.

**User Response:** Do one of the following:

- If you want to reallocate the cache space partitions, enter the ZBUFC ALLOC command to perform the task.
- If you want to perform maintenance, copy devices on the subsystem to another control unit. Once all devices are removed from the subsystem, enter a ZBUFC SETCACHE command to a known device on the subsystem to put subsystem storage in the deactivated state.

**CYEA0086W CACHING PENDING OFF IN PROGRESS ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 RCS SSID specified in the message, indicating that subsystem storage is being made unavailable for caching due to an explicit host request.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding activated for the 3990 RCS SSID specified in the message.

**User Response:** Ensure this condition was the result of a ZBUFC ALLOCATE IMPLEMNT command request. If required, enter a ZBUFC ENABLE command request to activate caching for the subsystem.

---

**CYEA0087I NVS ACTIVE ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 RCS SSID specified in the message, indicating that the nonvolatile storage (NVS) is available for fast-write cache functions.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding reset for the 3990 RCS SSID specified in the message, if it is no longer degraded.

**User Response:** None.

---

**CYEA0089W NVS DEACTIVATE PENDING ON RCS SSID** *ssss*

**Where:**

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 RCS SSID specified in the message, indicating that the nonvolatile storage (NVS) is being made unavailable for fast-write caching functions due to an explicit host request.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding activated for the 3990 RCS SSID specified in the message.

**User Response:** Ensure this condition was the result of a ZBUFC FILE command request. If required, enter a ZBUFC ENABLE command request to enable fast-write caching again.

---

**CYEA0090I CACHING ACTIVATED FOR DEVICE** *dddd* **ON RCS SSID** *ssss*

**Where:**

*dddd*
Represents a 3990 Record Cache device address.

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 RCS SSID specified in the message, indicating that the device specified in the message is available for caching functions.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding reset for the 3990 RCS SSID specified in the message, if it is no longer degraded.

**User Response:** None.

---

**CYEA0092I DASD FAST WRITE ALLOWED FOR DEVICE** *dddd* **ON RCS SSID** *ssss*

**Where:**

*dddd*
Represents a 3990 Record Cache device address.

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 RCS SSID specified in the message, indicating that the device specified in the message is available for fast-write caching functions.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding reset for the 3990 RCS SSID specified in the message, if it is no longer degraded.

**User Response:** None.

---

**CYEA0093W FAST WRITE SUSPENDED FOR DEVICE** *dddd* **RCS SSID** *ssss* **DUE TO PINNED DATA**

**Where:**

*dddd*
Represents a 3990 Record Cache device address.

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 RCS SSID specified in the message, indicating that fast-write capability is suspended for the device specified in the message due to the pinned data threshold being exceeded.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding set for the 3990 RCS SSID specified in the message, if required.

**User Response:** Action is required to clear the pinned data condition before fast-write capability is restored for the device.

---

**CYEA0094I RECORD MODE ALLOWED FOR DEVICE** *dddd* **ON RCS SSID** *ssss*

**Where:**

*dddd*
Represents a 3990 Record Cache device address.

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 RCS SSID specified in the message, indicating that the device specified in the message is allowed to perform record caching functions.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding reset for the 3990 RCS SSID specified in the message, if it is no longer degraded.

**User Response:** None.

---

**CYEA0095I NO PINNED DATA EXISTS FOR DEVICE** *dddd* **ON RCS SSID** *ssss*

**Where:**

*dddd*
Represents a 3990 Record Cache device address.

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 RCS SSID specified in the message, indicating that the device specified in the message no longer has any pinned data in the subsystem.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding reset for the 3990 RCS SSID specified in the message, if it is no longer degraded.

**User Response:** None.

**CYEA0096W PINNED DATA EXISTS FOR DEVICE** *dddd* **ON RCS SSID** *ssss*

**Where:**

*dddd*
Represents a 3990 Record Cache device address.

*ssss* Represents a 3990 Record Cache Subsystem (RCS) SSID.

**Explanation:** A state change interrupt was received from the 3990 RCS SSDI specified in the message, indicating that the device specified in the message has pinned data tracks in the subsystem.

**System Action:** Processing is continued with the input/output (I/O) queue thresholding activated for the 3990 RCS SSID specified in the message.

**User Response:** Enter the ZBUFC DISPLAY PINNED command, as required, to determine where the pinned data resides. If required, start a DASD copy operation to ensure data is filed to another DASD volume surface before taking the module offline.

**CYED0001I MODULE QUEUE FOR** *xxxx* **MAY BE STALLED.**

**Where:**

*xxxx*
The device address.

**Explanation:** A nonempty queue is detected in the file status table for this device and this device has had no activity since the last scan of the table. This indicates that the TPF system is probably running in a stressed environment. If the capture function or the file copy function is running, this message may appear intermittently.

**System Action:** The normal CYED message sequence is: CYED01, CYED04, and CYED05. The first time CYED detects a device whose queue has not moved in two scans, it writes the CYED01 message and time stamps the device. On the next scan, if the device queue still has not moved, it issues the CYED04 message. Afterward, it issues the CYED05 message until the device queue moves. When the device queue moves, CYED resets and starts the process over.

**User Response:** If the message continues, a manual intervention is required to analyze and correct the problem.

**CYED0004I POSSIBLE STALLED MODULE QUEUE FOR** *addr*

**Where:**

*addr*
The device address.

**Explanation:** A nonempty queue is detected in the file status table for this device and this device has had no activity in the last three scans of the table. This indicates that the TPF system is probably running in a very stressed environment. If the capture function or the file copy function is running, this message may appear intermittently.

**System Action:** The normal CYED message sequence is: CYED01, CYED04, and CYED05. The first time CYED detects a device whose queue has not moved in two scans, it writes the CYED01 message and time stamps the device. On the next scan, if the device queue still has not moved, it issues the CYED04 message. Afterward, it issues the CYED05 message until the device queue moves. When the device queue moves, CYED resets and starts the process over.

**User Response:** If this message continues, a dump and manual intervention are required to analyze and correct the problem.

**CYED0005I MODULE QUEUE FOR** *xxxx* **STALLED FOR ABOUT** *yyyy* **SECONDS, CURRENT QUEUE COUNT** *zzzzzz*

**Where:**

*xxxx*
The device address.

*yyyy*
The approximate number of seconds the queue has been stalled.

*zzzzz*
The number of input/output blocks (IOBs) on the module queue.

**Explanation:** A nonempty queue is detected in the file status table for this device and this device has had no activity for three or more scans of the table. This indicates that the TPF system is probably running in a stressed environment and this message will appear intermittently.

**System Action:** None.

**User Response:** Manual intervention is required to analyze and correct the problem.

**CYED0007W CFLF RECONNECT FAILED FOR DEVICE** *dddd* **SSID** *ssss*

**Where:**

*dddd*
The device address for which a multi-path lock facility (MPLF) connect request was requested.

*ssss* The associated DASD subsystem ID to which the device is attached.

**Explanation:** A path to the MPLF connect device has been lost. The attempt to connect to the device again over an alternate path failed.

**System Action:** None.

**User Response:** Manual intervention is required to analyze and correct the problem.

---

**CYED0008T CFLF RECONNECT ABANDONED FOR SSID** *ssss*

**Where:**

*ssss* The DASD subsystem ID for which an attempt to establish a multi-path lock facility (MPLF) connect device has been abandoned.

**Explanation:** The DASD subsystem connect device was taken offline. The attempt to establish a new MPLF connect device on the DASD subsystem was abandoned because no usable modules were found.

**System Action:** None.

**User Response:** Manual intervention is required to analyze and correct the problem.

---

**CYED0009I CFLF RECONNECT COMPLETE ON DEVICE** *dddd* **SSID** *ssss*

**Where:**

*dddd*
The newly established multi-path lock facility (MPLF) connect device address.

*ssss* The associated DASD subsystem ID to which the device is attached.

**Explanation:** The DASD subsystem connect device was taken offline. The attempt to establish a new MPLF connect device on the DASD subsystem completed successfully.

**System Action:** None.

**User Response:** None.

---

**CYED0010I** *nnnn* **MODULES WERE STALLED. SOME MESSAGES WERE SUPPRESSED.**

**Where:**

*nnnn*
The total number of stalled module queues detected on this scan.

**Explanation:** During stalled module queue processing in CCSONS(CJIC), the indicated number of stalled modules were detected. Detailed diagnostic messages were previously issued for the first 50 stalled modules detected; all subsequent stalled module queue messages were suppressed.

**System Action:** The TPF system has performed the appropriate scanning and queue restart functions for all DASD modules. However, only the first 50 affected modules are individually reported.

**User Response:** Detailed diagnostic messages were issued for the first 50 stalled modules. Follow the user responses indicated for those diagnostic messages.

---

**CYEM0100E** *errdesc*, **SSID-***ssid*, **DVC-***ccud*, **TYPE-***tttt*, **MOD-***sym*, *faddr*, **CHR-***ccchhrr*, **CSW-***stst*, **CCW-***cc*, **SNS-***ssssssss ssssssss ssssssss ssssssss*, **CHPID-***path*

**Where:**

*errdesc*
Message text varies based on the error condition.

*ssid* The 3990 record cache subsystem (RCS) ID, if applicable.

*ccud*
The device address in hexadecimal.

*tttt* The device type.

*sym*
The symbolic module in hexadecimal, which is only displayed when the module is a real-time module or the copy module.

*faddr*
One of the following:

**FADR-***fileaddr*
The file address of the associated data record, where *fileaddr* is a 16-digit hexadecimal file address. This field is omitted if the operation is FNSPC, FLSPC, FDCTC, or the address is not in file address reference format (FARF).

**MCHR-***mmcchhrr*
The file address of the associated data record, where *mmcchhrr* is a hexadecimal file address in MCHR format. This field is omitted when the operation is FDCTC.

*ccchhrr*
The cylinder, head, and record, in hexadecimal, where the I/O error occurred. This is omitted when there is no disk address associated with the error.

*stst* Status bytes, in hexadecimal, of the channel status word.

*cc* The command code, in hexadecimal, of the channel command word being processed during the error. This defaults to ** if there is no command code.

*ssssssss*
32 sense bytes if the device supports 32 sense bytes; otherwise, 24 sense bytes and 8 bytes of zeros are displayed.

*path*
1-byte channel path ID (CHPID) value, in hexadecimal, representing the last path used mask (LPUM) associated with the error.

**Explanation:** A hardware error or a channel program error has been detected.

**System Action:** None.

**User Response:** Do the following:

1. Run the EREP utility to obtain more information about the error.
2. Give the information collected in step 1 to your IBM service representative. If frequent errors continue, consider taking the device offline.

See the following publications from the IBM Storage Subsystem product library:

- *3990 Storage Control Reference (Models 1, 2, and 3)* for general information about these errors
- *3990 Operations and Recovery Reference* for information about the service information messages (SIMs).

---

**CYEN0099E DVC–*ccud* MOD–*sym* TAKEN OFF-LINE DUE TO *errdesc***

**Where:**

*ccud*
The device address (in hexadecimal).

*sym*
The symbolic module (in hexadecimal). The symbolic module is displayed only when the module is a real-time module or the copy module.

*errdesc*
Provides a brief description of why the module is being taken offline.

**CC-3 ON ALL PATHS**
Unable to communicate with the device over any defined path.

**CFLF SUBSYSTEM FAILURE**
The concurrency filter lock facility (CFLF) subsystem failed. See the information provided for the CYGN-prefixed messages that follow this message.

**CHANNEL CHECKS**
Channel checks were detected while trying to communicate with the device over all defined paths.

**DEVICE NOT OPERATIONAL**
There are path errors with the equipment check, and intervention required is set.

**EQUIP CHECK**
The device equipment check that caused the loss of paths.

**EQUIP CHECK – PATH UNAVAILABLE**
The equipment check on the path.

**INTERNAL CONTROL I/O FAILURE**
An internally-initiated recovery I/O operation failed to the device referenced in the message.

**INTERVENTION REQUIRED**
The device reported that intervention is required; loss of ready status.

**LOST INTERRUPT**
Unable to communicate with the device within a user-defined time period.

**PERSISTENT LOCK FAILURE**
An undefined multi-path lock facility (MPLF) return code was found while processing a lock input/output (I/O) operation. The device is taken offline following a 000706 system error.

**PERSISTENT SENSE FAILURE**
A sense failure was detected. After resetting and clearing the subchannel and retrying I/O, the sense failed again.

**PINNED DATA CONDITION**
An I/O operation failed because of a pinned data condition on the 3990 Record Cache Subsystem. An attempt is made to clear the pinned data for the device prior to taking the device offline.

**RCS QUEUE THRESHOLD EXCEEDED**
The TPF system was directed (through a user exit interface) to take the specified record cache subsystem (RCS) device offline because the total subsystem I/O queue exceeded a computed I/O queue threshold limit.

**SUBCHANNEL REMOVED FROM CONFIGURATION**
A channel report word (CRW) was received and an analysis by common input/output (CIO) indicates that the subchannel belonging to the specified device was deleted from the configuration. This is probably the result of detaching a device while running under the IBM Virtual Machine (VM) system.

**RCS STATE-CHANGE-PENDING TIMER EXPIRED**
A stalled device queue associated with an RCS device in the state change pending condition, persisted beyond the user specified time-out value.

**Explanation:** The device referenced in the message was taken offline because of the error referenced in the message. Depending on the cause of the failure, the CYEM0099E error message may accompany this message.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Correct the error.
3. Enter the ZMCPY UP command to bring the module back online.

See *TPF Operations* for more information about the ZMCPY UP command.

---

**CYF90001T UNABLE TO READ CTK9 (CYYM ERROR)**

**Explanation:** Program CYF9 entered program CYYM to retrieve CTK9, but CYYM could not retrieve it.

**System Action:** Recoup processing ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start the function again.

---

**CYGM0005W UNABLE TO RETRIEVE CTK9 WILL TRY AGAIN IN ONE MINUTE**

**Explanation:** The CYYM monitor called program experienced a problem retrieving keypoint 9.

**System Action:** The monitor tries to retrieve keypoint 9 again in one minute. A CTL-0FB precedes this message indicating a possible DASD hardware error or system definition problem.

**User Response:** Review the system error dump to determine the cause of the error and to correct it.

---

**CYGM0006W IN *xxx devtype* POOL, *numaddr* ADDRESSES HAVE BEEN ADDED**

**Where:**

*xxx* One of the following pool types: SLT, LLT, 4LT, SDP, LDP, 4DP, or 4D6.

*devtype*
The device type.

*numaddr*
The number of addresses from the pool type that were added.

**Explanation:** The number of available addresses for the pool type specified in this message has increased.

**System Action:** None.

**User Response:** None.

**CYGM0007W EXCESSIVE USE OF *xxx devtype* ADDRS– *numaddr* USED IN LAST 3 MIN.**

**Where:**

*xxx* One of the following pool types: SLT, LLT, 4LT, SDP, LDP, 4DP, or 4D6.

*devtype*
The device type.

*numaddr*
The number of addresses from the pool type that were used in the last 3 minutes.

**Explanation:** The pool type specified in the message exceeded the usage limits set in keypoint 9 in the three previous 1-minute intervals. These limits can be set by entering the ZGFSP command.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the excess usage.
2. Adjust the limits, if needed, by entering the ZGFSP command.

**CYGM0008W *xxx devtype* POOL IS BELOW MINIMUM LIMIT, *numaddr* AVAILABLE**

**Where:**

*xxx* One of the following pool types: SLT, LLT, 4LT, SDP, LDP, 4DP, or 4D6.

*devtype*
The device type.

*numaddr*
The number of addresses available.

**Explanation:** The number of addresses available for the pool type specified in the message has fallen below the minimum level.

**System Action:** None.

**User Response:** Replenish the pool records through a directory update or a pool recoup.

**CYGM0009W FACS ERROR ON CY2KT ORDINAL *xx* WILL TRY AGAIN IN ONE MINUTE**

**Where:**

*xx* Record ordinal number of a #CY2KT fixed file record.

**Explanation:** The pool monitor experienced a problem while retrieving a #CY2KT fixed file record.

**System Action:** The pool monitor tries to retrieve the #CY2KT fixed file record again in 1 minute.

**User Response:** Determine the cause of the problem and whether the pool monitor needs to be turned off by entering the ZGFSP OPT command with the NOMON parameter specified.

See *TPF Operations* for more information about the ZGFSP OPT command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

**CYGM0010W FIND ERROR ON CY2KT ORDINAL *xx* WILL TRY AGAIN IN ONE MINUTE**

**Where:**

*xx* Record ordinal number of a #CY2KT fixed file record.

**Explanation:** The pool monitor experienced a problem while retrieving a #CY2KT fixed file record.

**System Action:** The pool monitor tries to retrieve the #CY2KT fixed file record again in 1 minute.

**User Response:** Determine the cause of the problem and whether the pool monitor needs to be turned off by entering the ZGFSP OPT command with the NOMON parameter specified.

See *TPF Operations* for more information about the ZGFSP OPT command. See *TPF General Macros* and *TPF Application Programming* for more information about find errors.

**CYGM0011W *xxx devtype* POOL USE HAS EXCEEDED LIMIT. *numaddr* ADDRESSES USED IN LAST MIN.**

**Where:**

*xxx* One of the following pool types: SLT, LLT, 4LT, SDP, LDP, 4DP, and 4D6.

*devtype*
The device type.

*numaddr*
The number of addresses from pool type that were used in the last minute.

**Explanation:** The pool type specified in the message exceeded the usage limits set in keypoint 9 in the last minute. These limits can be set by entering the ZGFSP command.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the excess usage.
2. Adjust the limits, if needed, by entering the ZGFSP command.

**CYGN0001E CFLF ERROR CODE *ret_code* ON**

**Where:**

*ret_code*
The return code.

**Explanation:** An abnormal return code is returned from a concurrency filter lock facility (CFLF) operation. This message is followed by the CYGN0002I message to identify the subsystem on which the error occurred.

**System Action:** Processing is continued.

**User Response:** None.

See *3990 Transaction Processing Facility Support RPQs* for more information about the return codes.

**CYGN0002I DASD SUBSYSTEM ID *ssid***

**Where:**

*ssid* The subsystem identifier.

**Explanation:** This message accompanies the CYGN01E, CYGN03I, and CYGN09W messages to identify the subsystems these messages refer to.

**System Action:** Processing is continued.

**User Response:** None.

**CYGN0003I LOCK RECOVERY STARTING**

**Explanation:** Lock recovery has started. This message is preceded by the CYGN0002I message to indicate the subsystem ID on which the recovery is taking place.

**System Action:** Lock recovery processing is continued.

**User Response:** None.

**CYGN0004I SUBSYSTEM IN LOCK SUSPENSE**

**Explanation:** This message is issued during lock recovery to inform you that all modules on the affected subsystem are placed in lock-suspended state

**System Action:** Lock recovery processing is continued.

**User Response:** None.

**CYGN0005I SUBSYSTEM CLEARED**

**Explanation:** This message is issued during lock recovery to inform you that global disconnect orders were completed. The affected subsystem is cleared and ready to be rebuilt.

**System Action:** Lock recovery processing is continued.

**User Response:** None.

**CYGN0006I SUBSYSTEM RECONNECTED**

**Explanation:** This message is issued during lock recovery to inform you that reconnect orders were completed. Each processor is reconnected to the affected subsystem.

**System Action:** Lock recovery processing is continued.

**User Response:** None.

**CYGN0007I LOCK RECOVERY COMPLETED**

**Explanation:** Lock recovery is complete. Modules on the affected subsystems are now usable.

**System Action:** The TPF system is now available for use.

**User Response:** None.

**CYGN0008E LOCK RECOVERY FAILURE**

**Explanation:** Lock recovery cannot complete because:

- Of a bad concurrency filter lock facility (CFLF) return code
- A function could not be processed.

**System Action:** The modules are brought offline.

**User Response:** Do the following:

1. Correct the affected subsystem.
2. Bring the modules back online.

See *3990 Transaction Processing Facility Support RPQs* for more information.

**CYGN0009W SUBSYSTEM IS BEING TAKEN DOWN**

**Explanation:** This message is issued when the lock recovery fails and, as a result, a permanent concurrency filter lock facility (CFLF) error occurs.

**System Action:** All of the modules on the subsystem are taken offline.

**User Response:** Do the following:

1. Correct the affected subsystem.
2. Bring the modules back online.

See *3990 Transaction Processing Facility Support RPQs* for more information.

**CYGN0010E RECOVERY DISCONNECT/RECONNECT FAILURE**

**Explanation:** During concurrency filter lock facility (CFLF) lock recovery processing, CYGN is unable to disconnect or reconnect to the affected subsystem.

**System Action:** The subsystem is brought offline.

**User Response:** Do the following:

1. Correct the affected subsystem.
2. Bring the modules back online.

See *3990 Transaction Processing Facility Support RPQs* for more information.

**CYGN0011E RECOVERY EVENT NOT FOUND**

**Explanation:** During concurrency filter lock facility (CFLF) lock recovery processing and while CYGN is requesting various functions, an event is not found.

**System Action:** The subsystem is brought offline.

**User Response:** Do the following:

1. Correct the affected subsystem.

2. Bring the modules back online.

See *3990 Transaction Processing Facility Support RPQs* for more information.

---

**CYGR0001T PXP MIGRATION NOT COMPLETE ON SS-*ssuname***

**Where:**

*ssuname*
The subsystem user (SSU) name.

**Explanation:** Pool expansion migration was not completed before integrated online pool maintenance and recoup support was installed on the TPF system.

**System Action:** State change is disabled, and restart processing is stopped.

**User Response:** Do the following:

1. Bring up the TPF system with the old image.
2. Follow the instructions in *TPF Migration Guide: Program Update Tapes* for pool expansion migration.
3. Follow the instructions in *TPF Migration Guide: Program Update Tapes* for integrated online pool maintenance and recoup support migration.

See *TPF Migration Guide: Program Update Tapes* for more information about pool expansion and integrated online pool maintenance and recoup support migration.

---

**CYGR0002T STORAGE CARVED FOR POOL STRUCTURES WAS TOO SMALL. CARVE SIZE HAS BEEN RESET FOR THE NEXT IPL.**

**Explanation:** Storage carved by the CTIN programs for pool structures is based on an aggregate carve size value stored in keypoint B. When segment CYGR attempted to use this storage to set up various pool structures, the storage was found to be too small. The correct amount of storage required has been calculated and stored in keypoint B. The correct value is used the next time you IPL the TPF system.

**System Action:** State change is disabled and restart processing is stopped.

**User Response:** IPL the TPF system again to pick up the corrected storage carve size value.

---

**CYGR0099T POOL RESTART FAILED – STATE CHANGE DISABLED.**

**Explanation:** A severe error occurred causing pool restart processing to fail. To obtain diagnostic information, view the console for online message CYGR0001T or CYGR0002T, or system error message 000690, 000698, 00069A, or 00069B.

**System Action:** Restart processing is stopped with state change disabled.

**User Response:** See the user response for the online error message CYGR0001T or CYGR0002T, or system error 000690, 000698, 00069A, or 00069B to correct the problem.

---

**CYYE0050E ERROR OCCURRED DURING FILING OF KEYPOINT C**

**Explanation:** The CYYA program returned an error to the CYYE program while trying to file the updated core copy of keypoint C.

**System Action:** None.

**User Response:** Do the following:

1. Review the system error dump to determine the cause of the error.
2. Correct the error.

See *TPF Operations* for more information about displaying keypoint C.

---

**CYYE0051E ERROR OCCURRED DURING FINDING OF KEYPOINT C**

**Explanation:** The CYYA program returned an error to the CYYE program while trying to retrieve the file copy of keypoint C.

**System Action:** None.

**User Response:** Do the following:

1. Review the system error dump to determine the cause of the error.
2. Correct the error.

See *TPF Operations* for more information about displaying keypoint C.

---

**CZSA0001E SYSPLEX TIMER SYNCHRONISM CHECK**

**Explanation:** The sysplex timer (STR) machine check handler (CZSA) issues this message when a machine check interruption reports an STR synchronism check.

**System Action:** None.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information about machine check handling. Also see *ESA/390 Principles of Operation* for more information about machine check handling.

# DADD–DADF

---

**DADD0003I UNIQUE COPIES OF THIS RECORD EXIST FOR OTHER I-STREAMS, PROCESSORS, OR SUBSYSTEM USERS**

**Explanation:** The record type specified in the ZDADD command is one of the following:

- I-stream unique
- Processor unique
- Subsystem-user unique.

**System Action:** The file address is displayed for the current (default) I-stream, processor, and subsystem user where the command was entered. Other records, with different file addresses, may exist for other I-streams, processors, or subsystem users.

**User Response:** Use the IS-x CPUID-y SSU-zzzz optional parameters to display the file address for a specific I-stream, processor, or subsystem user.

See *TPF Operations* for more information about the ZDADD command.

---

**DADD0004I FARF ADDRESS-*fileaddr* PRIME ADDRESS-*mmcchhr* DUPLICATE ADDRESS-*mmcchhr***

**Where:**

*fileaddr*
The 16-digit hexadecimal file address.

*mmcchhr*
The 7-byte module, cylinder, head, and record (MCHR) address of the file.

**Explanation:** This is a normal response to the ZDADD command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDADD command.

---

**DADD0005I FARF ADDRESS-*fileaddr* PRIME ADDRESS-*mmcchhr***

**Where:**

*fileaddr*
The 16-digit hexadecimal file address.

*mmcchhr*
The 7-byte module, cylinder, head, and record (MCHR) address of the file.

**Explanation:** This is a normal response to the ZDADD command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDADD command.

---

**DADD0052E ORDINAL NUMBER TOO LARGE**

**Segment Reference:** CFD1

**Explanation:** The specified ordinal number is larger then the value defined for the record type.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDADD command.

---

**DADD0053E RECORD TYPE NOT IN USE**

**Segment Reference:** CFD1

**Explanation:** The specified record type was not defined to the TPF system according to the file address compute (FACE) program.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDADD command.

---

**DADD0056E ORDINAL NUMBER NOT IN VALID RANGE**

**Segment Reference:** CFD1

**Explanation:** The ordinal number specified falls within an undefined gap in the ordinal number range of this record type. Usually this is a PSON gap within a pool section. There may be larger, valid ordinal numbers.

**System Action:** This message is issued and the ECB is exited.

**User Response:** Enter the ZDADD command again with a valid ordinal number.

See *TPF Operations* for more information about the ZDADD command.

---

**DADD0057E INVALID I-STREAM NUMBER**

**Explanation:** The I-stream number specified in the ZDADD command is not valid.

**System Action:** None.

**User Response:** Enter the ZDADD command again with the correct I-stream number.

See *TPF Operations* for more information about the ZDADD command.

---

**DADD0058E INVALID CPU ID**

**Explanation:** The CPU ID specified in the ZDADD command is not valid.

**System Action:** None.

**User Response:** Enter the ZDADD command again with the correct CPU ID.

See *TPF Operations* for more information about the ZDADD command.

---

**DADD0059E INVALID SUBSYSTEM USER NAME**

**Explanation:** The subsystem user (SSU) name specified in the ZDADD command is not valid.

**System Action:** None.

**User Response:** Enter the ZDADD command again with the correct SSU name.

See *TPF Operations* for more information about the ZDADD command.

---

**DADD0060E RECORD DOES NOT EXIT FOR REQUESTED I-STREAM, CPUID, OR SSU**

**Explanation:** A request to display the I-stream unique, processor unique, or subsystem user (SSU) unique records was made by entering the ZDADD command. But the specified record does not exist for the requested I-stream, processor, or SSU.

**System Action:** None.

**User Response:** Enter the ZDADD command again with the correct I-stream number, CPU ID, or SSU name.

See *TPF Operations* for more information about the ZDADD command.

---

**DADD0061E ESFAC UNABLE TO TRANSLATE FILE ADDRESS-*fileaddr***

**Where:**

*fileaddr*
The 16-digit hexadecimal file address.

**Explanation:** A ZDADD command was entered, but the ESFAC macro was unable to translate the output file address from the file address compute (FACE) program.

**System Action:** The command is rejected.

**User Response:** Enter the ZDADD command again and specify a valid file address.

See *TPF Operations* for more information about the ZDADD command. See *TPF System Macros* for more information about the ESFAC macro.

---

**DADD0062E INPUT RECORD TYPE IS NOT VALID**

**Explanation:** The ZDADD command was entered, but the record type value was not specified or the value specified was greater than 4 hexadecimal digits.

**System Action:** The command is rejected.

**User Response:** Enter the ZDADD command again and specify a valid record type value.

See *TPF Operations* for more information about the ZDADD command.

---

**DADF0001E INVALID INPUT MESSAGE FORMAT**

**Segment Reference:** CYB6

**Explanation:** The TPF system issues this message when you enter a command with a format that is not valid.

**System Action:** The display or alter request is not processed.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZDREC, ZAREC, ZDFIL, ZAFIL, ZADCA, and ZDDCA commands.

---

**DADF0002E INVALID STARTING ADDRESS**

**Segment Reference:** CYB6

**Explanation:** The TPF system issues this message when you specify a starting address in the command that is not valid.

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again and specify a valid starting address.

See *TPF Operations* for more information about the ZDPGM, ZAPGM, ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

---

**DADF0004E ALTER DATA TOO LONG**

**Segment Reference:** CYB6

**Explanation:** The alter data specified in the ZAREC or ZAFIL commands is too long.

**System Action:** The alter request is not processed.

**User Response:** Enter the command again and specify less alter data.

See *TPF Operations* for more information about the ZAREC and ZAFIL commands.

---

**DADF0005E PROGRAM NOT FOUND**

**Segment Reference:** CYB6

**Explanation:** The program specified in the command is not allocated.

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again and specify a valid program name.

See *TPF Operations* for more information about the ZDPGM and ZAPGM commands.

---

**DADF0009E INVALID MODULE NUMBER**

**Segment Reference:** CYB6

**Explanation:** The module number specified in the command is note valid.

**System Action:** The display or alter command is not processed.

**User Response:** Enter the command again and specify a valid module number.

See *TPF Operations* for more information about the ZDPGM, ZAPGM, ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

---

**DADF0010E INVALID CYLINDER NUMBER**

**Segment Reference:** CVBA

**Explanation:** The TPF system issues this message when the address you specified contains an a cylinder number that is not valid.

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again and specify a valid cylinder number.

See *TPF Operations* for more information about the ZDPGM, ZAPGM, ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

---

**DADF0011E INVALID HEAD NUMBER**

**Segment Reference:** CVBA

**Explanation:** The TPF system issues this message when the address you specified contains an a head number that is not valid.

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again with a valid head number.

See *TPF Operations* for more information about the ZDPGM, ZAPGM, ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

---

**DADF0013E INVALID DISPLAY LENGTH**

**Segment Reference:** CYB6

**Explanation:** The number of bytes specified in the command is not valid. The maximum number of bytes that can be displayed is 4K (4096 bytes).

**System Action:** The display request is not processed.

**User Response:** Enter the command again and specify a valid display length.

See *TPF Operations* for more information about the ZDREC, ZDFIL, and ZDDCA commands.

---

**DADF0014E MODULE OFF-LINE**

**Segment Reference:** CYB6

**Explanation:** The record that was requested to be displayed or altered resides on a DASD module that is offline.

**System Action:** The display or alter request is not processed.

**User Response:** Do the following:

1. Enter the ZMCPY UP command to bring the DASD module online.
2. Enter the command again once the DASD module is back online.

See *TPF Operations* for more information about the ZDPGM, ZAPGM, ZAREC, ZDREC, ZAFIL, and ZDFIL commands.

---

**DADF0015E GENERAL FILE NOT MOUNTED**

**Segment Reference:** CYB6

**Explanation:** The general file is not mounted.

**System Action:** The display or alter request is not processed.

**User Response:** Do the following:

1. Enter the ZFMNT command to mount the general file.
2. Enter the command again after the general file is mounted.

See *TPF Operations* for more information about the ZDPGM, ZAPGM, ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

---

**DADF0016E PRIME/DUP ERROR**

**Segment Reference:** CYB6

**Explanation:** A request was made for the duplicate copy but it does not exist.

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again without the TYPE-D parameter specified.

See *TPF Operations* for more information about the ZDPGM, ZAPGM, ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

---

**DADF0017E INVALID FARF ADDRESS**

**Segment Reference:** CYB6

**Explanation:** The file address specified in the command is not valid.

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again and specify a valid file address.

See *TPF Operations* for more information about the ZDPGM, ZAPGM, ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

---

**DADF0018E INVALID GF RELATIVE RECORD NUMBER**

**Segment Reference:** CYBA

**Explanation:** The TPF system issues this message when the address you specified contains a pool general file relative record number that is not valid.

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again and specify a valid general file relative record number.

See *TPF Operations* for more information about the ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

---

**DADF0019E ERROR FILING RECORD**

**Segment Reference:** CYB6

**Explanation:** An error occurred while trying to file the altered copy.

**System Action:** The record was not altered successfully.

**User Response:** Do the following:

1. Refer to the other error messages displayed at the prime computer room agent set (CRAS) console to determine why the updated record could not be filed.
2. Take the appropriate corrective action to resolve the problem.
3. Enter the command again (once the problem is corrected) to update the record again.

See *TPF Operations* for more information about the ZAPGM, ZAREC, and ZAFIL commands.

---

**DADF0022E INVALID MCHR ADDRESS**

**Segment Reference:** CYB6

**Explanation:** The MCHR address specified in the command is note valid.

**System Action:** The display or alter request is not processed.

**User Response:** Be sure that:

- The correct version of the file address compute (FACE) program table (FCTB) is loaded to the TPF system
- You are running with the correct version of CTKX.

See *TPF Operations* for more information about the ZAPGM and ZDPGM commands.

---

**DADF0025E INVALID RECORD TYPE**

**Segment Reference:** CYB6

**Explanation:** The record type specified in the command is not valid.

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again and specify a valid record type.

See *TPF Operations* for more information about the ZDREC and ZAREC commands.

**DADF0026E INVALID ORDINAL NUMBER**

**Segment Reference:** CYB6

**Explanation:** The ordinal number specified in the command is not valid.

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again and specify a valid ordinal number.

See *TPF Operations* for more information about the ZDREC and ZAREC commands.

**DADF0027E PRIME/DUP REQUEST VALID ONLY FOR FARF**

**Segment Reference:** CYB6

**Explanation:** The PRIME/DUPLICATE parameter is only valid for file address reference format (FARF) addresses.

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again and do not specify the PRIME/DUP parameter.

See *TPF Operations* for more information about the ZDPGM, ZAPGM, ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

**DADF0028E THIS REQUEST VALID ONLY FOR FARF FORMAT**

**Segment Reference:** CYB6

**Explanation:** The request specified is only valid for file address reference format (FARF) addresses.

**System Action:** The display request is not processed.

**User Response:** Enter the command again without the PRINT parameter specified.

See *TPF Operations* for more information about the ZDFIL command.

**DADF0029E INVALID I-STREAM NUMBER**

**Segment Reference:** CYB6

**Explanation:** The I-stream number specified in the command is not within the range of valid I-streams in the TPF system.

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again and specify a valid I-stream number.

See *TPF Operations* for more information about the ZDCOR, ZACOR, ZDDCA, ZADCA, ZAREC, and ZDREC commands.

**DADF0030E ATTEMPT TO DISPLAY/ALTER PAST END OF SVM**

**Segment Reference:** CYB6

**Explanation:** The values specified in the command exceed past the end of the system virtual memory (SVM) main storage.

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again and specify a lower starting address or a shorter length.

See *TPF Operations* for more information about the ZDCOR, ZACOR, ZDDCA, and ZADCA commands.

**DADF0031E INCORRECT SUBSYSTEM USER NAME**

**Segment Reference:** CYB6

**Explanation:** The dump tag was not found on the subsystem user (SSU).

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again and specify a correct subsystem user (SSU) name or a correct dump tag.

See *TPF Operations* for more information about the ZDDCA and ZADCA commands.

**DADF0032E ENTRY RESTRICTED TO BASIC SUBSYSTEM**

**Segment Reference:** CYB6

**Explanation:** The dump tag was found on the basic subsystem (BSS) but not on the subsystem that issued the command.

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again from the basic subsystem (BSS).

See *TPF Operations* for more information about the ZDDCA and ZADCA commands.

**DADF0034E INVALID TYPE CODE SPECIFIED**

**Segment Reference:** CYB6

**Explanation:** The type code specified in the command is not valid. The valid type codes vary depending on which command is used.

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again and specify a valid type code.

See *TPF Operations* for more information about the ZDPGM, ZAPGM, ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

**DADF0035E I/O HARDWARE ERROR**

**Segment Reference:** CYB6

**Explanation:** The record that was requested to be display or altered could not be retrieved due to an input/output (I/O) hardware error.

**System Action:** The display or alter request is not processed.

**User Response:** Do the following:

1. Refer to the other error messages displayed at the prime computer room agent set (CRAS) console to determine why the record could not be retrieved.
2. Take the appropriate corrective action to resolve the problem.
3. Enter the command again to display or alter the record once the problem is corrected.

See *TPF Operations* for more information about the ZDPGM and ZAPGM commands.

**DADF0036E RECORD ID CHECK ERROR**

**Segment Reference:** CYB6

**Explanation:** The record that was requested to be displayed or altered could not be retrieved due to a record ID check error.

**System Action:** The display or alter request is not processed.

**User Response:** Be sure that:

- The program you are displaying or altering was loaded to the TPF system
- You are running with the correct version of CTKX and the file address compute (FACE) program table (FCTB).

See *TPF Operations* for more information about the ZDPGM and ZAPGM commands.

**DADF0037E RECORD CODE CHECK ERROR**

**Segment Reference:** CYB6

**Explanation:** The record that was requested to be displayed or altered could not be retrieved due to a record code check error.

**System Action:** The display or alter request is not processed.

**User Response:** Be sure that:

- The program you are displaying or altering was loaded to the TPF system
- You are running with the correct version of CTKX and the file address compute (FACE) program table (FCTB).

See *TPF Operations* for more information about the ZDPGM and ZAPGM commands.

**DADF0038E INVALID SHORT LENGTH**

**Segment Reference:** CYB6

**Explanation:** The record that was requested to be displayed or altered could not be retrieved because the requested record length does not match the actual length of the record.

**System Action:** The display or alter request is not processed.

**User Response:** Be sure that:

- The correct version of the file address compute (FACE) program table (FCTB) is loaded to the TPF system
- You are running with the correct version of CTKX
- You have properly formatted your online DASD packs during initial TPF system generation.

See *TPF Operations* for more information about the ZDPGM and ZAPGM commands.

**DADF0039E INVALID LONG LENGTH RECORD**

**Segment Reference:** CYB6

**Explanation:** The record that was requested to be displayed or altered could not be retrieved because the requested record length does not match the actual length of the record.

**System Action:** The display or alter request is not processed.

**User Response:** Be sure that:

- The correct version of the file address compute (FACE) program table (FCTB) is loaded to the TPF system
- You are running with the correct version of CTKX
- You have properly formatted your online DASD packs during initial TPF system generation.

See *TPF Operations* for more information about the ZDPGM and ZAPGM commands.

**DADF0040E END OF FILE**

**Segment Reference:** CYB6

**Explanation:** The record that was requested to be displayed or altered could not be retrieved because the end of file was reached.

**System Action:** The display or alter request is not processed.

**User Response:** Be sure that:

- The correct version of the file address compute (FACE) program table (FCTB) is loaded to the TPF system
- You are running with the correct version of CTKX
- You have properly formatted your online DASD packs during initial TPF system generation.

See *TPF Operations* for more information about the ZDPGM and ZAPGM commands.

**DADF0041E INVALID FILE ADDRESS**

**Segment Reference:** CYB6

**Explanation:** The record requested to be displayed or altered could not be retrieved because a file address was specified that is not valid.

**System Action:** The display or alter request is not processed.

**User Response:** Be sure that:

- The correct version of the file address compute (FACE) program table (FCTB) is loaded to the TPF system
- You are running with the correct version of CTKX

- You enter the command again and specify a valid file address.

See *TPF Operations* for more information about the ZDPGM, ZAPGM, ZAREC, ZDREC, ZAFIL, and ZDFIL commands.

---

**DADF0042E INVALID COPY SPECIFIED**

**Segment Reference:** CIPY

**Explanation:** The TPF system issues this message when a value that is not valid was specified on the COPY parameter. Valid parameters are F, C, or B.

**System Action:** The display or alter request is not processed.

**User Response:** Enter the command again and specify a valid COPY parameter.

See *TPF Operations* for more information about the ZDPGM and ZAPGM commands.

---

**DADF0043E ERROR IN FINDING PATCH ROOT FILE**

**Segment Reference:** CIPY

**Explanation:** The TPF system issues this message when an error occurs while trying to retrieve the memory patch deck root file.

**System Action:** The requested alteration is not made.

**User Response:** Enter the ZIFIL IBMMS/00E7/00/23/23/NNN/N command to force the ZPTCH root file fixed record to be initialized again.

See *TPF Operations* for more information about the ZAPGM and ZPTCH commands.

---

**DADF0044E VALIDITY CHECK ERROR**

**Segment Reference:** CIPY, CVBC, CVAX

**Explanation:** The TPF system issues this message when hexadecimal validation data specified on the VALDATA parameter does not match the data to be altered at the specified address.

**System Action:** The requested alteration is not made.

**User Response:** Enter the command again and specify a corrected starting address or corrected validation data.

See *TPF Operations* for more information about the ZAPGM, ZADCA, ZACOR, ZAREC and ZAFIL commands.

---

**DADF0045E CORE ONLY UPDATES ALLOWED WHEN IN PATCH MODE**

**Segment Reference:** CIPY

**Explanation:** An active patch deck was found for the terminal where the command was entered.

**System Action:** The requested activation is not made.

**User Response:** Do one of the following:

- Enter the command again with the COPY-C parameter
- Deactivate ZPTCH processing by entering the ZPTCH STOP command.

See *TPF Operations* for more information about the ZAPGM and ZPTCH commands.

---

**DADF0046E INVALID PRINT OPTION SPECIFIED**

**Segment Reference:** CVBA

**Explanation:** The TPF system issues this message when a value was specified on the PRINT parameter that is not valid. Valid parameters are R, RC, or RCP.

**System Action:** The display request is not processed.

**User Response:** Enter the command again and specify a valid PRINT parameter.

See *TPF Operations* for more information about the ZDFIL command.

---

**DADF0047E CORE UPDATE NOT ALLOWED FOR PRIVATE PROGRAMS**

**Segment Reference:** CIPY

**Explanation:** A request was made to alter the core copy of a private program. This cannot be done by entering the ZAPGM command.

**System Action:** The requested alteration is not made.

**User Response:** Do the following:

1. Enter the ZRPGM command to lock the program in core.
2. Enter the ZACOR command to alter the program.

See *TPF Operations* for more information about the ZAPGM command.

---

**DADF0048E CORE DISPLAY NOT ALLOWED FOR PRIVATE PROGRAMS**

**Segment Reference:** CIPY

**Explanation:** A request was made to display the core copy of a private unique program. This cannot be done by entering the ZDPGM command.

**System Action:** The program is not displayed.

**User Response:** Enter the ZRPGM command to lock the program and enter a ZDCOR command to display the program.

See *TPF Operations* for more information about the ZDPGM command.

---

**DADF0049E ORDINAL NUMBER NOT SPECIFIED**

**Segment Reference:** CIPZ

**Explanation:** The TPF system issues this message when a request was made to alter a fixed-file record or a pool record without specifying a valid hexadecimal ordinal number.

**System Action:** The fixed-file record or the pool record is not displayed or altered.

**User Response:** Enter the command again and specify the ordinal number.

See *TPF Operations* for more information about the ZDREC

and ZAREC commands. Also see *TPF Main Supervisor Reference* for more information.

### DADF0050E PROGRAM HEADER ALTER NOT ALLOWED

**Segment Reference:** CIPY

**Explanation:** A request was made to alter the program header of a segment.

**System Action:** The segment is not altered.

**User Response:** Enter the command again with a larger relative starting address (RSA).

See *TPF Operations* for more information about the ZAPGM command.

### DADF0051E PROGRAM NOT IN CORE

**Segment Reference:** CIPY

**Explanation:** A request was made (by using the COPY-C or COPY-B parameter) to display the core copy of a program. The program is not currently in core.

**System Action:** The segment is not displayed.

**User Response:** Use the COPY-F parameter to display the file copy of the program or enter the ZRPGM command to lock the program in core before displaying it.

See *TPF Operations* for more information about the ZDPGM command.

### DADF0052E ADDRESS NOT VALID FOR GIVEN I-STREAM

**Segment Reference:** CVAN

**Explanation:** A request was made to alter or display memory at an address that was not valid for the specified I-stream.

**System Action:** The memory contents are not altered or displayed.

**User Response:** Enter the command again and specify a corrected address or a corrected I-stream number.

See *TPF Operations* for more information about the ZACOR, ZDDCA, and ZADCA commands.

### DADF0054E CORE UPDATE NOT ALLOWED FOR ISUNIQUE PROGRAMS

**Segment Reference:** CYB6

**Explanation:** The core copy of an I-stream unique program cannot be updated by entering the ZAPGM command.

**System Action:** The alter request is not processed.

**User Response:** Enter the ZRPGM command to lock the program in core and a ZACOR command to update it.

See *TPF Operations* for more information about the ZAPGM commands.

### DADF0055E CORE DISPLAY NOT ALLOWED FOR ISUNIQUE PROGRAMS

**Segment Reference:** CYB6

**Explanation:** The core copy of an I-stream unique program cannot be displayed by entering the ZAPGM command.

**System Action:** The display request is not processed.

**User Response:** Enter the ZRPGM command to lock the program in core and a ZDCOR command to display it.

See *TPF Operations* for more information about the ZDPGM command.

### DADF0056E ERROR READING IMAGE CONTROL RECORD

**Explanation:** An error was found while reading the image control record (ICR).

**System Action:** Processing for the command is ended.

**User Response:** Be sure that:

- The correct version of the file address compute (FACE) program table (FCTB) is loaded to the TPF system
- You are running with the correct version of CTKX
- You have properly formatted and initialized your online DASD packs during initial TPF system generation.

See *TPF Operations* for more information about the ZAPGM and ZDPGM command. Also see *TPF System Installation Support Reference* for more information.

### DADF0057E ERROR READING IMAGE HISTORY RECORD

**Explanation:** An error was found while reading the image history record (IHR).

**System Action:** Processing for the command is ended.

**User Response:** Be sure that the correct version of the file address compute (FACE) program table. (FCTB) is loaded to the TPF system. Be sure that you are running with the correct version of CTKX.

See *TPF Operations* for more information about the ZAPGM and ZDPGM command. Also see *TPF System Installation Support Reference* for more information.

### DADF0058E FACS ERROR ENCOUNTERED

**Explanation:** An error was found while calculating a file address.

**System Action:** Processing for the command is ended.

**User Response:** Be sure that:

- The correct version of the file address compute (FACE) program table (FCTB) is loaded to the TPF system
- You are running with the correct version of CTKX.

See *TPF Operations* for more information about the ZAPGM and ZDPGM commands. Also see *TPF System Installation Support Reference* for more information.

### DADF0059E ERROR RETRIEVING USER COMPONENT RECORD

**Explanation:** An error was found while retrieving USR1 or USR2 from file.

**System Action:** Processing for the command is ended.

**User Response:** Be sure that:

- The user component you are displaying or altering was loaded to the TPF system
- You are running with the correct version of CTKX and the file address compute (FACE) program table (FCTB).

See *TPF Operations* for more information about the ZAPGM and ZDPGM commands. Also see *TPF System Installation Support Reference* for more information.

### DADF0060E ERROR READING IMAGE POINTER RECORD

**Explanation:** An error was found while reading the image pointer record (CTKX).

**System Action:** Processing for the command is ended.

**User Response:** Be sure that:

- CTKX was loaded into the TPF system.
- You are running with the correct version of CXTX and the file address compute (FACE) program table (FCTB).

See *TPF Operations* for more information about the ZAPGM and ZDPGM commands. Also see *TPF System Installation Support Reference* for more information.

### DADF0061E TYPE-G OPTION IS ONLY VALID FOR 4-BYTE GF ADDRESS

**Explanation:** A request was made to display or alter a file record with the type parameter identifying the file address as a 4-byte *relative record number* general file address. The address specified was, however, not a 4-byte address. Rather, it was a 7-byte address. The TYPE-G parameter is only valid with a 4-byte *relative record number* general file address.

**System Action:** Processing for the command is ended. The file record is not displayed or altered.

**User Response:** Enter the command again with a corrected address or a corrected type parameter.

See *TPF Operations* for more information about the ZDFIL and ZAFIL commands. Also see *TPF Database Reference* for more information.

### DADF0062E ERROR RETRIEVING CIMR RECORD

**Explanation:** An error was found while retrieving a CIMR component from file.

**System Action:** Processing for the command is ended.

**User Response:** Do the following:

1. Be sure that the CIMR component you are displaying or altering was loaded to the TPF system.
2. Be sure that you are running with the correct version of CTKX and the file address compute (FACE) program table (FCTB).

See *TPF Operations* for more information about the ZAPGM and ZDPGM commands. Also see *TPF System Installation Support Reference* for more information.

### DADF0063E SYSTEM HEAP ADDRESS NOT CURRENTLY IN USE

**Explanation:** One of the following occurred:

- A ZACOR or ZDCOR command was entered, but the starting or ending system heap address specified is not in use.
- A ZADCA or ZDDCA command was entered specifying a dump tag that resides in the system heap. However, the starting or ending system heap address is not in use.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a starting system heap address that is in use, or specify less data to be displayed or altered.

See *TPF Operations* for more information about the ZACOR, ZDCOR, ZADCA, and ZDDCA commands.

### DADF0064E VALIDATION DATA EXTENDS PAST END OF RECORD

**Explanation:** A ZAFIL, ZAPGM, or ZAREC command was entered, but the length of the validation data specified with the VALDATA parameter extends beyond the end of the record.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify less validation data.

See *TPF Operations* for more information about the ZAFIL, ZAPGM, and ZAREC commands.

### DADF0065E PRINT OPTION DOES NOT SUPPORT FARF6

**Explanation:** The ZDFIL command was entered with an 8-byte file address and the PRINT parameter specified. The PRINT parameter does not support 8-byte file addresses.

**System Action:** The command is rejected.

**User Response:** Enter the ZDFIL command again without the PRINT parameter specified.

See *TPF Operations* for more information about the ZDFIL command.

### DADF0100E LOADSET OR VERSION PARAMETER VALID ONLY WHEN E-TYPE LOADER RECORDS HAVE BEEN ALLOCATED

**Explanation:** No E-type loader records (#OLDx) were defined for the TPF system. Therefore, you cannot specify a program version code or the LOADSET parameter when you enter the ZAPGM or ZDPGM command.

**System Action:** The command is rejected.

**User Response:** Enter the ZAPGM or ZDPGM command again and do not specify a program version code or the LOADSET parameter.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command.

---

**DADF0101E LOADSET PARAMETER VALID ONLY AFTER E-TYPE LOADER RESTART HAS COMPLETED**

**Explanation:** The E-type loader restart routine did not complete. Therefore, you can specify the LOADSET parameter for the ZAPGM or ZDPGM command only when you specify the Copy-F parameter.

**System Action:** The command is rejected.

**User Response:** Wait until the E-type loader restart routine completes and then enter the ZAPGM or ZDPGM command again.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command.

---

**DADF0103E LOADSET OR VERSION VALID ONLY FOR REALTIME PROGRAMS**

**Explanation:** The specified program is not a real-time program. Therefore, you cannot specify a program version code or the LOADSET parameter when you enter the ZAPGM or ZDPGM command.

**System Action:** The command is rejected.

**User Response:** Enter the ZAPGM or ZDPGM command again. Specify the name of a real-time program if you specify a program version code or the LOADSET parameter.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command.

---

**DADF0104E LOADSET *lsname* DOES NOT EXIST**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The loadset name specified for the ZAPGM or ZDPGM command is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZAPGM or ZDPGM command again and specify a valid loadset name.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command.

---

**DADF0105E LOADSET *lsname* BEING LOADED, CANNOT PERFORM Z*x*PGM**

**Where:**

*lsname*
The name of the loadset.

*ZxPGM*
The ZAPGM or ZDPGM command.

**Explanation:** The specified loadset is in the process of being loaded. Therefore, you cannot alter or display programs contained in that loadset.

**System Action:** The command is rejected.

**User Response:** Enter the ZAPGM or ZDPGM command again after the loadset is loaded.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command or about loading loadsets.

---

**DADF0106E LOADSET *lsname* BEING DELETED, CANNOT PERFORM Z*x*PGM**

**Where:**

*lsname*
The name of the loadset.

*x* The ZAPGM or ZDPGM command.

**Explanation:** The specified loadset is marked for deletion and can no longer be accessed. You cannot alter or display the programs in that loadset anymore.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command or about deleting a loadset.

---

**DADF0107E PROGRAM *progname* VERSION *version* LOADSET *lsname* DOES NOT EXIST**

**Where:**

*progname*
The name of the program.

*version*
The program version code.

*lsname*
The name of the loadset.

**Explanation:** You cannot alter or display the specified version of the program because it does not exist in the specified loadset.

**System Action:** The command is rejected.

**User Response:** Enter the ZAPGM or ZDPGM command again. Specify the name of the loadset that contains the version of the program you want to alter or display.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command.

---

**DADF0108E PROGRAM *progname* LOADSET *lsname* DOES NOT EXIST**

**Where:**

*progname*
The name of the program.

*lsname*
The name of the loadset.

**Explanation:** You cannot alter or display the specified program because it does not exist in the specified loadset.

**System Action:** The command is rejected.

**User Response:** Enter the ZAPGM or ZDPGM command again. Specify the name of the loadset that contains the program you want to alter or display.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command.

---

**DADF0109E LOADSET *lsname* NOT ACTIVE, CANNOT PROCESS CORE COPY**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The specified loadset is not active. Therefore, a core copy of the program does not exist.

**System Action:** The command is rejected.

**User Response:** Enter the ZAPGM or ZDPGM command again and specify the Copy-F parameter.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command.

---

**DADF0110E PROGRAM *progname* VERSION *version* NOT ACTIVE**

**Where:**

*progname*
The name of the program.

*version*
The program version code.

**Explanation:** The specified version of the program was not found because it is not active. If you do not specify a loadset name for the ZAPGM or ZDPGM command, the TPF system searches only the active loadsets for the specified version of the program.

**System Action:** The command is rejected.

**User Response:** Enter the ZAPGM or ZDPGM command again. Specify the name of the loadset that contains the version of the program you want to alter or display.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command or about activating loadsets.

---

**DADF0111E MULTIPLE ACTIVE COPIES OF PROGRAM *progname* VERSION *version* EXIST, SPECIFY LOADSET NAME ON Z*x*PGM.**

**Where:**

*progname*
The name of the program.

*version*
The program version code.

*x* The ZAPGM or ZDPGM command.

**Explanation:** The specified version of the program was found in more than one active loadset. If you do not specify a loadset name for the ZAPGM or ZDPGM command, the TPF system searches all the active loadsets for the specified version of the program.

**System Action:** The command is rejected.

**User Response:** Enter the ZAPGM or ZDPGM command again. Specify the name of the loadset that contains the version of the program you want to alter or display.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command.

---

**DADF0112E PROGRAM *progname* IS UNALLOCATED, CANNOT PROCESS BASE VERSION**

**Where:**

*progname*
The name of the program.

**Explanation:** You cannot specify the LOADSET-BASE parameter for an unallocated program because unallocated programs do not have a base version.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command.

---

**DADF0113E FIND ERROR ON E-TYPE LOADER RECORD, Z*x*PGM ABORTED**

**Where:**

*x* The ZAPGM or ZDPGM command.

**Explanation:** An error occurred while attempting to access one of the E-type loader file records.

**System Action:** The command is rejected.

**User Response:** Review any previous error messages for information about the type of error that occurred and the type of E-type loader record that was involved.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command.

---

**DADF0114E LENGTH OF VERSION CODE MUST BE 2**

**Explanation:** The version code that was specified for the ZAPGM or ZDPGM command did not contain 2 characters.

**System Action:** The command is rejected.

**User Response:** Enter the ZAPGM or ZDPGM command again and specify a 2-character program version code.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command.

---

**DADF0115E LOADSET *lsname* IS BEING ACCEPTED, REISSUE Z*x*PGM WITH LOADSET NAME OF BASE**

**Where:**

*lsname*
The name of the loadset.

*x* The ZAPGM or ZDPGM command.

**Explanation:** The specified loadset is in the process of being accepted. The TPF system considers programs in that loadset to be part of the base version.

**System Action:** The command is rejected.

**User Response:** Enter the ZAPGM or ZDPGM command again and specify the LOADSET-BASE parameter.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command or about accepting loadsets.

---

**DADF0116E PROGRAM NAME MISMATCH – EXPECTING *progname1*, FOUND PROGRAM *progname2***

**Where:**

*progname1*
The name of the program the TPF system expected to find.

*progname2*
The name of the program the TPF system found instead.

**Explanation:** A program other than the one expected by the TPF system was found at the file address specified in the program allocation table (PAT). Either the PAT slot of *progname1* is damaged, or *progname2* was loaded at the wrong file address.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Perform a full load.
2. If the problem continues, load a new copy of the PAT.

See *TPF System Installation Support Reference* for more information about loading a new copy of the PAT.

---

**DADF0117E ERROR TRYING TO LOCK PROGRAM *progname* LOADSET *lsname* INTO CORE, ZAPGM ABORTED**

**Where:**

*progname*
The name of the program.

*lsname*
The name of the loadset.

**Explanation:** An I/O error was found while trying to lock the specified real-time program into core.

**System Action:** The ZAPGM command is rejected.

**User Response:** Determine the cause of the hardware problem and take the appropriate corrective action.

See *TPF Operations* for more information about the ZAPGM or ZDPGM command.

---

**DADF0118E INVALID CPU ID**

**Explanation:** The specified CPU ID is not valid.

**System Action:** None.

**User Response:** Enter the ZAREC or ZDREC command again with a correct CPU ID.

See *TPF Operations* for more information about the ZAREC and ZDREC commands.

---

**DADF0119E INVALID SUBSYSTEM USER NAME**

**Explanation:** The specified subsystem user (SSU) name is not valid.

**System Action:** None.

**User Response:** Enter the ZAREC or ZDREC command again with the correct SSU name.

See *TPF Operations* for more information about the ZAREC and ZDREC commands.

---

**DADF0120E RECORD DOES NOT EXIST FOR REQUESTED I-STREAM, CPUID, OR SSU**

**Explanation:** A request to display or alter I-stream unique, processor unique, or subsystem user (SSU) unique records was made by entering the ZDREC or ZAREC commands. But the specified record does not exist for the requested I-stream, processor, or SSU.

**System Action:** None.

**User Response:** Enter the ZDREC or ZAREC command again with a correct I-stream number, CPU ID, or SSU name.

See *TPF Operations* for more information about the ZDREC and ZAREC commands.

---

**DADF0121E ORDINAL NUMBER NOT IN VALID RANGE**

**Explanation:** The requested record ordinal number does not exist but other records may exist with higher ordinal numbers.

**System Action:** None.

**User Response:** Enter the ZAREC or ZDREC command again with the correct record ordinal number.

See *TPF Operations* for more information about the ZDREC and ZAREC commands.

---

**DADF0123E PROGRAM *xxxx* IS UNALLOCATED, IN SELECTIVE ACTIVE LOAD NOT ENABLED HERE — SPECIFY LOADSET OR VERSION**

**Where:**

*xxxx*
The requested program name.

**Explanation:** A loadset with the unallocated program referenced in the message was selectively activated but not enabled for the ECB processing the ZDPGM or ZAPGM request.

**System Action:** The ZDPGM or ZAPGM processing cannot determine which version of the program to process.

**User Response:** Do one of the following:

- Enter the ZAPGM or ZDPGM command again with LOADSET or version code information.
- Enable the loadset for the ECB and enter the command again.

See *TPF Operations* for more information about the ZAPGM or ZDPGM commands.

**DADF0124E LOADSET NAME *yyyy* IS NOT VALID—MUST BE GREATER THAN 4 CHARACTERS IF NOT LOADSET-BASE**

**Where:**

*yyyy*
The loadset name.

**Explanation:** The loadset names must be between 5 and 8 characters, with the exception of the default loadset name, which is BASE.

**System Action:** None.

**User Response:** Enter the command again and specify a loadset name that is between 5 and 8 characters long.

**DADF0125E *xxxx* IS A TRANSFER VECTOR OF *yyyy* – REISSUE FUNCTIONAL MESSAGE USING *yyyy***

**Where:**

*xxxx*
The requested program.

*yyyy*
The parent of the requested program.

**Explanation:** This message follows an attempt to submit a command with a transfer vector specified as the requested program name. The command is unable to complete the request by using the transfer vector.

**System Action:** The command is rejected.

**User Response:** Enter the command again by using the parent of the transfer vector (which is *yyyy*).

**DADF0127E THE FILE COPIES OF C LOAD MODULES CANNOT BE DISPLAYED OR ALTERED**

**Explanation:** The ZDPGM or ZAPGM command was entered with the COPY-F or COPY-B parameter specified for a program that is a C load module. You cannot display or alter the file copy of a C load module.

**System Action:** The request is ended and no data is displayed or altered.

**User Response:** Enter the ZDPGM or ZAPGM command again with the COPY-C parameter specified.

See *TPF Operations* for more information about the ZDPGM and ZAPGM commands and an example of the informational display.

**DADF0128E ATTEMPT TO ALTER PAST THE END OF THE PROGRAM OR MAIN STORAGE**

**Explanation:** An error occurred because the data length specified for alteration in the ZAPGM command exceeds the length of the C-load module or main storage.

**System Action:** The request is ended and no data is altered.

**User Response:** Enter the ZAPGM command again and specify a smaller value for the data length.

See *TPF Operations* for more information about the ZAPGM command.

# DBRI–DBRO

**DBRI0001E REQUEST REJECTED...DBR RUNNING**

**Explanation:** The request to start database reorganization (DBR) was rejected because DBR is already running.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRI0003E INVALID REQUEST**

**Explanation:** The request is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRI0006E OUT OF SEQUENCE...IPL GENERAL FILE AND REPEAT**

**Explanation:** The ZDBRI START command was entered but the TPF system IPLed is not a general file.

**System Action:** The ZDBRI START command is rejected.

**User Response:** Do the following:

1. IPL the general file.
2. Enter the command again.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRI0007E OUT OF SEQUENCE...WAIT UNTIL IPL OF PRIME MOD.**

**Explanation:** A ZDBRI START pool command was entered while running on the general file.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. IPL the prime module.
2. Enter the command again.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRI0020I DBR INPUT PHASE STARTED**

**Explanation:** The database reorganization (DBR) input phase was started.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRI0021E REJECTED...DBR START/RESTART INVALID BELOW 1052 STATE**

**Explanation:** The database reorganization (DBR) start or restart is not valid because the TPF system is below 1052 state.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Cycle the TPF system to 1052 state.
2. Enter the command again.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRI0024E REJECTED...MUST BE IN 1052 STATE FOR ZDBRI**

**Explanation:** The ZDBRI command was entered when the TPF system was not in 1052 state.

**System Action:** The command is ignored.

**User Response:** Do the following:

1. Cycle the TPF system (GF for fixed and prime mod for pool) to 1052 state.
2. Enter the ZDBRI command again.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRI0027E OPEN DATABASE TAPE(S) HAVE TO BE DISMOUNTED.**

**Explanation:** The ZDBRO command was entered when DBF/database reorganization (DBR) tapes are open.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZTOFF command with the BP parameter specified.
2. Enter the ZDBRO command again.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRI0032I RECORD TYPE ZZ FILED TO NEW SYSTEM RECORD. TYPE** *rectype*, **ORDINAL NUMBER** *ordnum*, **FARF ADDRESS** *fileaddr*

**Where:**

*rectype*
The record type.

*ordnum*
The 16-digit hexadecimal ordinal number.

*fileaddr*
The 16-digit hexadecimal file address.

**Explanation:** During the output phase, an error occurred when trying to find a record. A core block was zeroed out and a dummy (ZZ) record was placed in the zeroed block. The record ID for the dummy record is X'FFFF'.

**System Action:** The record is being filed on the new TPF system in the zeroed format and can be corrected as necessary.

**User Response:** Do the following:

1. Correct the dummy record, if necessary.
2. File the dummy record on the new TPF system again.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRI0040E ERROR ON FILING TO NEW SYSTEM..IGNORED RECORD TYPE** *rectype*, **ORDINAL NUMBER** *ordnum*, **FARF ADDRESS** *fileaddr*

**Where:**

*rectype*
The record type.

*ordnum*
The 16-digit hexadecimal ordinal number.

*fileaddr*
The 16-digit hexadecimal file address.

**Explanation:** An error occurred when filing to a new TPF system.

**System Action:** None.

**User Response:** Do the following:

1. Save the system console log.
2. See your system support personnel to correct the error.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRI0052E FIND ERROR ON DBR EXCEPTION RECORD**

**Explanation:** This message is appended to the 00047C system error.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRI0058I RECORD NOT FILED TO NEW SYSTEM RECORD TYPE** *rectype*, **ORDINAL NUMBER** *ordnum*, **FARF ADDRESS** *fileaddr*

**Where:**

*rectype*
The record type.

*ordnum*
The 16-digit hexadecimal ordinal number.

*fileaddr*
The 16-digit hexadecimal file address.

**Explanation:** The ID was taken from the header of the record type ordinal number specified in the message and checked in the record ID attribute table (RIAT). The restore attribute associated with this ID is NO, so this record is not restored in the new TPF system.

**System Action:** The record is not written to the new TPF system.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRI0060E FILE ERROR ON DBR MASTER RECORD**

**Explanation:** An error was found while trying to file a database reorganization (DBR) control record.

**System Action:** The 00047C system error is issued and database reorganization (DBR) is aborted.

**User Response:** Do the following:

1. Check the system console sheet and system error dump to determine the cause of the error.
2. Correct the error.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRI0070E FACE ERROR ON DBR CONTROL RECORD**

**Explanation:** There was a file address compute (FACE) program error on the database reorganization (DBR) control record.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRI0084T TAPE ERROR DBR INPUT PHASE...ABORTING**

**Explanation:** A tape error occurred during the database reorganization (DBR) input phase.

**System Action:** DBR is aborted.

**User Response:** Do the following:

1. Correct or remake the input tape.
2. Start or restart the input phase of DBR.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRI0087I DBR HAS FINISHED INPUT PROCESSING FOR REC.TYPE *rectype*, SSU *ssu*, PROC *x*, ISTREAM *yy***

**Where:**

*rectype*
The record type.

*ssu* The subsystem user.

*x* The processor ID.

*yy* The I-stream, which is displayed as a decimal number.

**Explanation:** The user captured subsystem user (SSU)/processor/I-stream unique records. This is an informational message stating when database reorganization (DBR) completes a record type for a particular SSU/processor/I-stream. When the entire record type is done, then DBRI0015I message is issued.

**System Action:** DBR continues processing input records from tape.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRI0089T FRAME TIME-OUT...DBR ABORTED**

**Explanation:** During the input phase of database reorganization (DBR), DBR does not file records from the DBF/DBP tape until there are enough frames available in the TPF system If enough frames to process DBR do not become available within 5 minutes, DBR is ended.

**System Action:** DBR is ended.

**User Response:** Do one of the following:

- Enter a ZCTKA A FRM-*xxxx* command to increase the number of frames available in the TPF system. Then, IPL the TPF system again.
- Enter a ZDBRO IECB xx command to decrease the number of ECBs needed to process DBR. Then, start DBR again.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0000I REQUEST COMPLETE**

**Explanation:** The command request completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0001E REQUEST REJECTED...DBR RUNNING.**

**Explanation:** A command was entered while database reorganization (DBR) was running. Only DISPLAY, ABORT, STATUS, or XECB commands are valid while DBR is running.

**System Action:** The command is ignored and processing is continued.

**User Response:** Enter the command again when DBR is completed.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0002E REQUEST REJECTED...OUT OF SEQUENCE**

**Explanation:** A command was entered, however, database reorganization (DBR) is presently in a state where the function requested cannot be honored. An example of this would be a second request to start DBR before the present run is complete.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Verify that the TPF system and DBR are in the proper state.
2. Ensure that DBR is not active in the same subsystem or subsystem user (SSU) on a different processor in a loosely coupled complex.
3. Enter the command again.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0003E INVALID REQUEST**

**Explanation:** A command that is not valid was entered.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0004E DBR RECORDS NOT INITIALIZED**

**Explanation:** The database reorganization (DBR) control and exception records were not initialized.

**System Action:** The command is ignored.

**User Response:** Enter the INIT command to initialize the DBR control and exception records.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0005E ERROR MESSAGE BEING REPORTED IS GREATER THAN 99**

**Explanation:** An error number was passed to the database reorganization (DBR) message processor that was greater than the highest message number issued by the DBR program package.

**System Action:** The program continues.

**User Response:** Check the 00047C system error to determine the cause of the error and to correct it.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0008I REQUEST COMPLETE...ALSO SET CAPTURE BIT IN MASTER**

**Explanation:** A request to bypass an ordinal number range for a record type not set to be captured was issued.

**System Action:** The ordinal number range is set and the capture bit is turned on for the specified record type.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0009E REQUEST REJECTED...DBR NOT ACTIVE**

**Explanation:** The database reorganization (DBR) was not activated.

**System Action:** The command is ignored.

**User Response:** Enter the START/RESTART command to activate DBR.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0010I DBR OUTPUT PHASE STARTED**

**Explanation:** The database reorganization (DBR) output phase was started.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0011I DBR OUTPUT PHASE COMPLETE**

**Explanation:** The database reorganization (DBR) output phase was completed.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* and *TPF Database Logic* for more information about database reorganization (DBR).

---

**DBRO0012I DBR OUTPUT PHASE RESTARTED**

**Explanation:** The database reorganization (DBR) output phase was restarted.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0013E LOGGING MUST BE ACTIVE IN NORM STATE. SEE ZFCAP.**

**Explanation:** A command was entered to start or restart database reorganization (DBR) while the TPF system is in NORM state and logging is active. This is a type 2 message.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Cycle the TPF system to 1052 state.
2. Enter the command again or start logging and then enter the command again.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

### DBRO0015I DBR HAS FINISHED PROCESSING RECORD TYPE *rectype*

**Where:**

*rectype*
The record type

**Explanation:** This message is displayed after each record type is placed on the output tape.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

### DBRO0016I DBR FIXED OUTPUT PHASE COMPLETE

**Explanation:** The database reorganization (DBR) fixed output phase was completed.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

### DBRO0017I DBR POOL OUTPUT PHASE COMPLETE

**Explanation:** The database reorganization (DBR) pool output phase was completed.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

### DBRO0018E NUMBER OF ECBS INVALID

**Explanation:** A command was entered to modify the available ECB count contains a value that is too high or is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a value that is a decimal number between 01 and 99.

If the value is rejected, specify a lower number such that enough frames to process database reorganization (DBR) are created by this message.

See *TPF Database Reference* for more information about database reorganization (DBR).

### DBRO0019A MOUNT DGF FOR POOL DBR

**Explanation:** the pool controller started processing and needs the data general file mounted.

**System Action:** None.

**User Response:** Mount the data general file.

See *TPF Database Reference* for more information about database reorganization (DBR).

### DBRO0021E REJECTED...DBR START/RESTART INVALID BELOW 1052 STATE

**Explanation:** The database reorganization (DBR) start or restart is not valid because the TPF system is below 1052 state.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Cycle the TPF system to 1052 state.
2. Enter the command again.

See *TPF Database Reference* for more information about database reorganization (DBR).

### DBRO0025E *xxx* NUMBER MUST BE BETWEEN 1 AND 256

**Where:**

*xxx* The value specified in the parameter that is not valid.

**Explanation:** The DISPLAY command was entered to display the exception entries for a specific record type that contains a parameter that is not valid.

**System Action:** The DISPLAY command is rejected.

**User Response:** Enter the DISPLAY command again with a valid parameter.

See *TPF Database Reference* for more information about database reorganization (DBR).

### DBRO0026E *xxx* NUMBER EXCEEDS ENTRIES IN RECORD

**Where:**

*xxx* The value specified in the parameter that is not valid.

**Explanation:** The DISPLAY command was entered to display the exception entries for a specific record type that contains a parameter that is greater than the highest entry.

**System Action:** The DISPLAY command is rejected.

**User Response:** Enter the DISPLAY command again with a valid parameter.

See *TPF Database Reference* for more information about database reorganization (DBR).

### DBRO0027E OPEN DBR TAPE(S) HAVE TO BE DISMOUNTED

**Explanation:** A ZDBRO/ZDBSO START or ZDBRO/ZDBSO RESTART command was entered when the DBF/DBP tapes were open.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZTOFF command with the BP parameter specified.
2. Enter the ZDBRO or ZDBSO command again.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO and ZDBSO commands.

**DBRO0028E REJECTED...DBR ACTIVE IN ANOTHER PROCESSOR**

**Explanation:** A ZDBRO START/RESTART/BYPASS/RESET or ZDBSO START/RESTART/BYPASS/RESET command was entered for a particular subsystem or subsystem user (SSU) when a database reorganization (DBR) run was still active subsystem or SSU on a different processor in a loosely coupled complex.

**System Action:** The command is rejected.

**User Response:** Enter the ZDBRO START/RESTART/BYPASS/RESET or ZDBSO START/RESTART/BYPASS/RESET command again after the other processor has completed its DBR run.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO and ZDBSO commands.

**DBRO0030E NO ENTRIES IN DBR OVERRIDE RECORD**

**Explanation:** A command was entered to display the override record but the override record contains no valid entries.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRO0031E REJECTED...DBR ABORT ACTIVE**

**Explanation:** The database reorganization (DBR) utility issues this message if you issue an ABORT request when ABORT processing is still active.

**System Action:** The command is ignored.

**User Response:** Wait until the current ABORT processing completes. No further action is necessary.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRO0033E FIXED RECORD TYPE TOO HIGH**

**Explanation:** A command was entered that contained a record type greater than the highest fixed-record type defined by your TPF system.

**System Action:** The command is rejected.

**User Response:** Enter the command again with a valid record type.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRO0034E NO ENTRIES IN DBR MASTER KEYPOINT**

**Explanation:** A ZDBRO DISPLAY ALL command was entered but the DBR master keypoint contains no valid entries.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO DISPLAY command.

**DBRO0035E NO OVERRIDE PARAMETERS SPECIFIED**

**Explanation:** A START End command was entered without a valid *xxx* parameter specified.

**System Action:** The command is rejected.

**User Response:** Enter the START End command again with at least one valid *xxx* parameter.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the command.

**DBRO0036E NO ENTRIES EXIST**

**Explanation:** A command was entered to display EXC but the control records have no exception entries.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRO0037E NO EXCEPTIONS FOR SPECIFIED RECORD TYPE**

**Explanation:** A command was entered to display the exception entries for a specified record type but the record type has no exception entries.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRO0038E RANGE VALUE OVERLAPS AN EXISTING ENTRY**

**Explanation:** The range value specified in the command overlaps an existing entry.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Display the ordinal numbers that were already bypassed.
2. Enter the command again with a valid range of values.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRO0039E RANGE END NOT IN EXCEPTION TABLE**

**Explanation:** The range end value specified in the command is not valid.

**System Action:** None.

**User Response:** Do the following:

1. Display the exception entries for the specified record type.
2. Enter the command again with a valid range of values.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0041E RECORD TYPE FIELD INVALID OR MISSING**

**Explanation:** The record type specified in the command is not valid or was omitted.

**System Action:** The command is rejected.

**User Response:** Enter the command again with the correct record type specified.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0042E RANGE VALUE MISSING**

**Explanation:** A bypass or reset command was entered for a specific record type but the second range value was missing.

**System Action:** The command is rejected.

**User Response:** Enter the command again with a second range value.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0043E RANGE NOT NUMERIC**

**Explanation:** A bypass or reset command was entered for a specific record type but the range parameters are not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0044E RANGE VALUE TOO HIGH**

**Explanation:** A bypass or reset command was entered for a particular record type but the ordinal number specified was outside the range for the record type.

**System Action:** The command is rejected.

**User Response:** Enter the command again with a valid ordinal number range.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0045E RANGE NOT IN ASCENDING ORDER**

**Explanation:** See the explanation for the DBRO0043E message.

**System Action:** See the system action for the DBRO0043E message.

**User Response:** See the user response for the DBRO0043E message.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0046E RANGE CANNOT CONTAIN ALL AND AN ORDINAL NUMBER.**

**Explanation:** A command was entered with the RANGE parameter, ALL parameter, and ordinal number specified. If you specify the ALL parameter, you cannot specify an ordinal number.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0047E DBR EXCEPTION RECORD FULL**

**Explanation:** All 128 exception entries for the specified record type were used.

**System Action:** The command is ignored.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0048E NOTHING TO RESET**

**Explanation:** A command was entered to reset an entry in the database reorganization (DBR) control records but the entry was already reset.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0049E RANGE START NOT IN EXCEPTION TABLE**

**Explanation:** The range start value specified in the command is not valid.

**System Action:** None.

**User Response:** Do the following:

1. Display the exception entries for the specified record type.
2. Enter the command again with valid range values.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0050E FIND ERROR ON MASTER DBR RECORD**

**Explanation:** The TPF system found an error condition that prevented it from finding a database reorganization (DBR) control record.

**System Action:** The 00047C system error is issued and DBR is aborted.

**User Response:** Do the following:

1. Check the system console sheet and the system error dump to determine the cause of the error.

2. Correct the error.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0051E FIND ERROR ON DBR KEYPOINT RECORD**

**Explanation:** See the explanation for the DBRO0050E message.

**System Action:** See the system action for the DBRO0050E message.

**User Response:** See the user response for the DBRO0050E message.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0052E FIND ERROR ON DBR EXCEPTION RECORD**

**Explanation:** See the explanation for the DBRO0050E message.

**System Action:** See the system action for the DBRO0050E message.

**User Response:** See the user response for the DBRO0050E message.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0054E FIND ERROR ON DBR OVERRIDE RECORD**

**Explanation:** See the explanation for the DBRO0050E message.

**System Action:** See the system action for the DBRO0050E message.

**User Response:** See the user response for the DBRO0050E message.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0055E FIND ERROR ON SON DIRECTORY RECORD**

**Explanation:** The TPF system found an error condition that prevented it from finding the directory record.

**System Action:** The 00047C system error is issued and database reorganization (DBR) is aborted.

**User Response:** Do the following:

1. Check the system console sheet and the system error dump to determine the cause of the error.
2. Correct the error.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0056E FIND ERROR ON DGF KEYPOINT**

**Explanation:** The TPF system found an error condition that prevented it from finding the data general file keypoint.

**System Action:** The 00047C system error is issued and database reorganization (DBR) is aborted.

**User Response:** Do the following:

1. Check the system console sheet and the system error dump to determine the cause of the error.
2. Correct the error.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0057E RECORD NOT BEING CAPTURED — NOTHING TO BYPASS**

**Explanation:** A bypass command was entered for a specific record type but the capture bit for the record type was not on.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZDBRO START command to set the capture bit on for the record type, if a portion of this record type is to be captured.
2. Enter the bypass command to exclude the range that you do not want.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO START command.

---

**DBRO0060E FILE ERROR ON DBR MASTER RECORD**

**Explanation:** An error was found while trying to file a database reorganization (DBR) control record.

**System Action:** The 00047C system error is issued and database reorganization (DBR) is aborted.

**User Response:** Do the following:

1. Check the system console sheet and the system error dump to determine the cause of the error.
2. Correct the error.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0061E FILE ERROR ON DBR KEYPOINT RECORD**

**Explanation:** See the explanation for the DBRO0060E message.

**System Action:** See the system action for the DBRO0060E message.

**User Response:** See the user response for the DBRO0060E message.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0062I DBR IS PRESENTLY PROCESSING RECORD TYPE *rectype*, ORDINAL NUMBER *ordnum*, ECB *ecbnum***

**Where:**

*rectype*
The record type.

*ordnum*
The 16-digit hexadecimal ordinal number

*ecbnum*
The entry control block (ECB) number.

**Explanation:** This is the normal response to the ZDBRO STATUS or ZDBSO STATUS command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDBRO STATUS and ZDBSO STATUS commands. See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0063E FILE ERROR ON DBR OVERRIDE RECORD**

**Explanation:** See the explanation for the DBRO0060E message.

**System Action:** See the system action for the DBRO0060E message.

**User Response:** See the user response for the DBRO0060E message.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0064E FILE ERROR ON DBR CONTROL RECORD**

**Explanation:** See the explanation for the DBRO0060E message.

**System Action:** See the system action for the DBRO0060E message.

**User Response:** See the user response for the DBRO0060E message.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0065E FIND ERROR ON DASDI READ RECORD TYPE *rectype*, ORDINAL NUMBER *ordnum*, FARF ADDRESS *fileaddr***

**Where:**

*rectype*
The record type.

*ordnum*
The 16-digit hexadecimal ordinal number.

*fileaddr*
The 16-digit hexadecimal file address.

**Explanation:** A find error occurred while trying to read a data pool record.

**System Action:** A core block is obtained, zeroed, and posted with a record ID of X'EEFF'. It is then passed back to be placed on tape. Database reorganization (DBR) processing is continued. This is known as the dummy or the ZZ record.

**User Response:** Turn over the system console log to your system support personnel for record correction if necessary.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0066E FACE ERROR...RECORD TYPE NOT VALID OR NOT IN USE. RECORD TYPE *rectype*, ORDINAL NUMBER *ordnum*, FARF ADDRESS *fileaddr***

**Where:**

*rectype*
The record type.

*ordnum*
The 16-digit hexadecimal ordinal number.

*filaddr*
The 16-digit hexadecimal file address.

**Explanation:** The capture byte was turned on for a record type that is not in the TPF system.

**System Action:** The record type is ignored and database reorganization (DBR) processing is continued with the next record type.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**DBRO0067I RECORD TYPES TO BE CAPTURED**

**Explanation:** The database reorganization (DBR) utility displays this message when you enter the ZDBRO DISPLAY or ZDBSO DISPLAY command with the ALL parameter specified. This message is followed by a display listing the record types to be captured for a particular subsystem user (SSU). As many as 8 record types are displayed per line. In 1052 state, the display is truncated with `..T` after 44 record types are displayed because of the lack of pool records in that state. In NORM state, `MORE` is appended to the end of the display if more than 48 record types are contained in the override record. The record types are displayed as hexadecimal numbers.

**System Action:** None.

**User Response:** If the display is truncated in 1052 state or if `MORE` is displayed in NORM state, enter one of the following:
- **ZDBRO DISPLAY ALL RECTYPE-***recvalue*
- **ZDBSO DISPLAY ALL RECTYPE-***recvalue*

  where *recvalue* is the last record type displayed before `..T` or `MORE`.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO DISPLAY and ZDBSO DISPLAY commands.

---

### DBRO0068I RECORD TYPES WITH EXCEPTIONS

**Explanation:** The database reorganization (DBR) utility displays this message when you enter the ZDBRO DISPLAY or ZDBSO DISPLAY command with the EXC parameter specified. This message is followed by a display listing the record types to be captured for a particular subsystem user (SSU). As many as 8 record types are displayed per line. In 1052 state, the display is truncated with `..T` after 44 record types are displayed because of the lack of pool records in that state. In NORM state, `MORE` is appended to the end of the display if more than 48 record types are contained in the override record. The record types are displayed as hexadecimal numbers.

**System Action:** None.

**User Response:** If the display is truncated in 1052 state or if `MORE` is displayed in NORM state, enter one of the following:
- **ZDBRO DISPLAY EXC RECTYPE-***recvalue*
- **ZDBSO DISPLAY EXC RECTYPE-***recvalue*

  where *recvalue* is the last record type displayed before `..T` or `MORE`.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO DISPLAY and ZDBSO DISPLAY commands.

### DBRO0069I RECORD TYPES IN OVERRIDE REC

**Explanation:** The database reorganization (DBR) utility displays this message when you enter the ZDBRO DISPLAY or ZDBSO DISPLAY command with the OVR parameter specified. This message is followed by a display listing the record types to be captured for a particular subsystem user (SSU). As many as 8 record types are displayed per line. In 1052 state, the display is truncated with `..T` after 44 record types are displayed because of the lack of pool records in that state. In NORM state, `MORE` is appended to the end of the display if more than 48 record types are contained in the override record. The record types are displayed as hexadecimal numbers.

**System Action:** None.

**User Response:** If the display is truncated in 1052 state or if `MORE` is displayed in NORM state, enter one of the following:
- **ZDBRO DISPLAY OVR RECTYPE-***recvalue*
- **ZDBSO DISPLAY OVR RECTYPE-***recvalue*

  where *recvalue* is the last record type displayed before `..T` or `MORE`.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO DISPLAY and ZDBSO DISPLAY commands.

### DBRO0070E FACE ERROR ON DBR CONTROL RECORD

**Explanation:** The TPF system found a file address compute (FACE) program error while processing the database reorganization (DBR) control record.

**System Action:** The 00047C system error is issued and database reorganization (DBR) is aborted.

**User Response:** Do the following:
1. Ensure that the #DBRRI record type is generated in the TPF system.
2. Turn over the system console sheet and dump to your system support personnel.

See *TPF Database Reference* for more information about database reorganization (DBR).

### DBRO0071E FACE ERROR...ORDINAL NUMBER INVALID

**Explanation:** A ordinal number that is outside the valid ordinal number range for a record type was passed to the file address compute (FACE) program.

**System Action:** The request is ignored and database reorganization (DBR) processing is continued.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

### DBRO0073E FACE ERROR ON DBR OVERRIDE RECORD

**Explanation:** See the explanation for the DBRO0070 message.

**System Action:** See the system action for the DBRO0070 message.

**User Response:** See the user response for the DBRO0070 message.

See *TPF Database Reference* for more information about database reorganization (DBR).

### DBRO0074E FACE ERROR ON SON DIRECTORY RECORD

**Explanation:** The TPF system found a file address compute (FACE) program error while processing a database reorganization (DBR) control record.

**System Action:** None.

**User Response:** Do the following:
1. Ensure that the #SONRI record type is generated in the TPF system.
2. Turn over the system console sheet and dump to your system support personnel.

See *TPF Database Reference* for more information about database reorganization (DBR).

### DBRO0075E FACE ERROR ON RECORD TYPE

**Explanation:** A command was entered for a record type that is not in the TPF system.

**System Action:** The command is rejected and database reorganization (DBR) processing is continued.

**User Response:** Ensure that the correct record type was specified.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRO0076E FACE ERROR ON EXCEPTION RECORD**

**Explanation:** See the explanation for the DBRO0070 message.

**System Action:** See the system action for the DBRO0070 message.

**User Response:** See the user response for the DBRO0070 message.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRO0077I EXCEPTIONS FOR RECORD TYPE** *rectype*

**Where:**

*rectype*
The record type.

**Explanation:** The database reorganization (DBR) utility displays this message when you enter the ZDBRO DISPLAY or ZDBSO DISPLAY command with the RECTYPE parameter specified. This message is followed by a display listing the ranges of ordinal numbers for records not to be captured for a record type in a particular subsystem user (SSU). As many as two pairs of ordinal number ranges are displayed per line. In 1052 state, the display is truncated with `..T` after nine pairs of ordinal number ranges are displayed because of the lack of pool records in that state. In NORM state, `MORE ENTRIES` is appended to the end of the display if more than 10 pairs of ordinal number ranges are contained in the exception record for the record type desired.

**System Action:** None.

**User Response:** If the display is truncated in 1052 state or if `MORE ENTRIES` is displayed in NORM state, enter one of the following:
- **ZDBRO DISPLAY RECTYPE-***recvalue* **START-***ordnum*
- **ZDBSO DISPLAY RECTYPE-***recvalue* **START-***ordnum*

where *recvalue* is the record type with exception entries and *ordnum* is the number of the entry that was missing from the original display.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO DISPLAY and ZDBSO DISPLAY commands.

**DBRO0085A TAPE ERROR...SWITCH DBF, THEN ENTER ZDBRO SWITCH**

**Explanation:** An unrecoverable error occurred on the file output tape.

**System Action:** The error tape is closed and a defer loop is entered until a new tape is mounted and the ZDBRO SWITCH command is entered.

**User Response:** Do the following:

1. Mount a new file output tape.
2. Enter the ZDBRO SWITCH command.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO SWITCH command.

**DBRO0086A TAPE ERROR...SWITCH DBP, THEN ENTER ZDBRO SWITCH**

**Explanation:** An unrecoverable error occurred on the pool output tape.

**System Action:** The error tape is closed and a defer loop is entered until a new tape is mounted and the ZDBRO SWITCH command is entered.

**User Response:** Do the following:

1. Mount a new pool output tape.
2. Enter the ZDBRO SWITCH command.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO SWITCH command.

**DBRO0090T CREEC TIME-OUT...DBR ABORTED**

**Explanation:** The input or output controller issues CREECs to file or find records until the CREEC count reaches the available ECB count in the control record and then enters a defer loop waiting for the CREECs to end. None of the CREECs were processed within the allotted time frame.

**System Action:** The tape is closed (if it is opened), the 00047C system error is issued, and the database reorganization (DBR) is aborted.

**User Response:** Turn over the console sheet and dump to your system support personnel.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRO0091E ILLOGICAL CONDITION FOR POOL SEGMENT**

**Explanation:** An ordinal number for a pool record was not found in the directory records. The ordinal number was valid based on the CSONC conversion tables but was not found in the directory records.

**System Action:** The DBP tape is closed, a 00047C system error is issued, and database reorganization (DBR) is aborted.

**User Response:** Do the following:

1. Ensure that the CSONC conversion tables and the directory records are correct.
2. Turn over the system console sheet and dump to your system support personnel.

See *TPF Database Reference* for more information about database reorganization (DBR).

**DBRO0092T DBR ABORTED...ADJUST ECBS WITH ZDBRO OECB AND RESTART DBR**

**Explanation:** An attempt to start the output phase of database reorganization (DBR) failed because there are not enough frames.

**System Action:** If the DBF/DBP tape was opened, it is closed and DBR is ended.

**User Response:** Enter the ZDBRO OECB command with an entry control block (ECB) value specified that is lower than

that which is currently defined in the DBR keypoint. If the value is rejected, specify a lower value such that enough frames to process DBR can be created by this message.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO OECB command.

---

**DBRO0093T DBR ABORTED...ADJUST ECBS WITH ZDBRO IECB AND RESTART DBR**

**Explanation:** An attempt to start the input phase of database reorganization (DBR) failed because there are not enough frames available.

**System Action:** If the DBF/DBP tape was opened, it is closed, and DBR is ended.

**User Response:** Enter the ZDBRO IECB command with an entry control block (ECB) value specified that is lower than that which is currently defined in the DBR keypoint. If the value is rejected, specify a lower value such that enough frames to process DBR can be created by this message.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO IECB command.

---

**DBRO0094E SUBSYSTEM USER NOT VALID**

**Explanation:** The subsystem user (SSU) specified in the command is not a valid SSUR.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Correct the SSU.
2. Enter the ZDBRO or ZDBSO INIT command again.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO and ZDBSO commands.

---

**DBRO0095E PROCESSOR NOT VALID**

**Explanation:** The processor specified in the ZDBRO command is not a valid processor.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Correct the processor ID.
2. Enter the ZDBRO INIT command again.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO INIT command.

---

**DBRO0096E I-STREAM VALUE MUST RANGE FROM 1 TO 16**

**Explanation:** The I-stream value (specified as a decimal number) in the ZDBRO INIT command is not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Correct the I-stream value.
2. Enter the ZDBRO INIT command again.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO INIT command.

---

**DBRO0097E TRIPLET FORMAT OR SSU/PROCESSOR/I-STREAM MUST BE ENTERED**

**Explanation:** A ZDBRO INIT command was entered in triplet format but omitted one of the parameters.

**System Action:** The command is rejected.

**User Response:** Enter the ZDBRO INIT command again in triplet format with three parameters included in the triplet.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO INIT command.

---

**DBRO0098E ZDBRO REJECTED BECAUSE OF PRIOR ZDBSO INIT**

**Explanation:** A ZDBSO INIT command was entered already. The subsystem user (SSU) output phase in progress must complete before entering additional ZDBRO commands.

**System Action:** The command is rejected.

**User Response:** Enter the ZDBRO INIT command again after the database reorganization (DBR) output phase is completed or enter the ZDBRO INIT command with the BYPASS=YES parameter specified if you want to overrule the previous ZDBRO or ZDBSO command.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO INIT command.

---

**DBRO0099E ZDBSO REJECTED BECAUSE OF PRIOR ZDBRO INIT**

**Explanation:** A ZDBRO INIT command was entered already. The output phase in progress must complete before entering additional ZDBSO commands.

**System Action:** The command is rejected.

**User Response:** Enter the ZDBRO INIT command again after the database reorganization (DBR) output phase is completed or enter the ZDBSO INIT command with the BYPASS=YES parameter specified if you want to overrule the previous ZDBRO or ZDBSO command.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBRO and ZDBSO commands.

---

# DBSO–DLOK

---

**DBSO0001I MULTIPLE SSU REQUEST COMPLETED**

**Explanation:** This is an informational message only. A ZDBSO command was entered and database reorganization (DBR) just completed processing the message on the last subsystem user (SSU) of the subsystem specified.

**System Action:** DBR is exited.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR). See *TPF Operations* for more information about the ZDBSO commands.

---

**DCFT0001I** *segment* **– REQUESTED TRACE TABLE ENTRIES – MOST RECENT FIRST** *entry1....entryn* **END OF REQUESTED TRACE TABLE ENTRIES**

**Where:**

*segment*
The name of the segment that issued this message.

*entry1....entryn*
An entry in the coupling facility (CF) trace table.

**Explanation:** This is the normal response to the ZDCFT command.

**System Action:** The coupling facility (CF) trace table entries that you requested are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZDCFT command.

---

**DCFT0002I** *segment* **– NO TRACE ENTRIES WERE AVAILABLE FOR DISPLAY**

**Where:**

*segment*
The name of the segment that issued this message.

**Explanation:** The ZDCFT command was entered to display entries in the coupling facility (CF) trace table, but there were no entries to display.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDCFT command.

---

**DCFT0003E** *segment* **– INSUFFICIENT MALLOC STORAGE TO DISPLAY REQUESTED ENTRIES**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** The ZDCFT command was entered to display entries in the coupling facility (CF) trace table, but the TPF system was not able to obtain enough entry control block (ECB) heap storage to display the entries you requested.

**System Action:** The ZDCFT command is rejected.

**User Response:** Do one of the following:

- Enter the ZDCFT command again, specifying a smaller number for the number of coupling facility (CF) trace table entries you want to display.
- Determine why the TPF system is not able to obtain enough entry control block (ECB) heap storage.

See *TPF Operations* for more information about the ZDCFT command.

---

**DCLV0001I STORAGE CONTROLS**

**Explanation:** A display of the control levels for the CPU loop, create macros, and input list lockout follows this message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDCLV and ZACLV commands.

---

**DCLV0015E INVALID FORMAT**

**Explanation:** There were no parameters specified on the ZDCLV command. If any extraneous text is included on the command line, this error message is the result.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDCLV command.

---

**DCOR0010I BEGIN DISPLAY**

**Explanation:** This is the normal response to the ZDCOR command. This message is followed by a display of the specified number of bytes.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDCOR command.

---

**DCOR0063E SYSTEM HEAP ADDRESS NOT CURRENTLY IN USE**

**Explanation:** The address specified in the ZACOR or ZDCOR command was in the system heap storage area but was not in use.

**System Action:** The value is not displayed or altered.

**User Response:** None.

See *TPF Operations* for more information about the ZACOR and ZDCOR commands.

---

**DCRS0000I CRAS STATUS TABLE**

**Explanation:** This is the normal response to the ZDCRS command. This message is followed by a display of the status table based on the parameters specified with the command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDCRS command.

---

**DCRS0005I ALT SLOT AVAILABLE**

**Explanation:** This is the normal response to the ZDCRS command with the A parameter specified if the alternate slot that is specified is not assigned.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDCRS command.

**DCRS0010E LNIATA NOT FOUND**

**Explanation:** The line number, interchange address, and terminal address (LNIATA) in the command could not be found in the computer room agent set (CRAS) status table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDCRS command.

**DCRS0015E INVALID FORMAT**

**Explanation:** The format of the command is not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZDCRS command.

**DCRS0016E INVALID CPUID**

**Explanation:** The CPU ID specified in the command is not valid for this complex.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDCRS command.

**DDAT0001I SUBSYSTEM *xxxx* DATE IS *ddmmmyy***

**Where:**

*xxxx*
The subsystem name.

*ddmmmyy*
The day, month, and year.

**Explanation:** This is a normal response to the ZDDAT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDDAT command.

**DDAT0002I ALL OTHER SUBSYSTEM CLOCKS ARE NOT RUNNING**

**Explanation:** All the other subsystems are in 1052 state, in the process of cycling above 1052 state, or in the process of cycling down to 1052 state. In any case, their subsystem clocks are not running.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDDAT command.

**DDAT0011I SUBSYSTEM *xxxx* CLOCKS ARE NOT RUNNING**

**Where:**

*xxxx*
The subsystem name.

**Explanation:** The subsystem is in 1052 state, is in the process of cycling above 1052 state, or is in the process of cycling down to 1052 state. In any case, the subsystem clocks are not running.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDDAT command.

**DDAT0012I SYSTEM DATE IS *ddmmmyy***

**Where:**

*ddmmmyy*
The day, month, and year.

**Explanation:** This is an informational message that states the current TPF system date.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDDAT command.

**DDAT0051E INVALID FORMAT**

**Explanation:** The format of the ZDDAT command is not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the ZDATT command again by using the correct format.

See *TPF Operations* for more information about the ZDDAT command.

**DDAT0052E NO SUBSYSTEM CLOCKS ARE RUNNING**

**Explanation:** The subsystem clocks are not running.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDDAT command.

**DDAT0061T FACE ERROR**

**Explanation:** The file address compute (FACE) program returned an error code while trying to find the subsystem clock record.

**System Action:** None.

**User Response:** Report this error your system support personnel.

See *TPF Operations* for more information about the ZDDAT command.

**DDAT0062T FIND ERROR**

**Explanation:** A find error returned an error code while trying to find the subsystem clock record.

**System Action:** None.

**User Response:** Report this error your system support personnel.

See *TPF Operations* for more information about the ZDDAT command.

**DDCA0001I DUMP TAG *yyyy* ADDRESS — *xxxxxxxx***

**Where:**

*yyyy*
The dump label.

*xxxxxxxx*
The address.

**Explanation:** This message is issued upon successful completion of the ZDDCA command. The main storage address of the dump label specified in the command was found.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDDCA command.

**DDCA0003E DUMP TAG *yyyy* NOT FOUND**

**Where:**

*yyyy*
The dump label.

**Explanation:** The dump tag specified in the message is not a valid dump tag.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDDCA command.

**DDCA0007E I-STREAM TABLE MAX INVALID**

**Explanation:** The integrity of the I-stream table (DCTIST) is questionable. A single I-stream is assumed for this display.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDDCA command.

**DDCA0008I DUMP TAG *yyyy* I-STREAM *zz* ADDRESS —*xxxxxxxx***

**Where:**

*yyyy*
The dump label.

*zz* The I-stream, which is displayed as a decimal number.

*xxxxxxxx*
The main storage address.

**Explanation:** This message is issued upon successful completion of the ZDDCA command. The main storage address of the dump label specified in the command was found for each of the I-streams noted in the output message text.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDDCA command.

**DDCA0010I BEGIN DISPLAY**

**Explanation:** This is the normal response to the ZDDCA command. This message is followed by a display of the inputted number of bytes.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDDCA command.

**DEAT0001I DISPLAY ECB ACTIVATION TABLE ACTIVATION NUMBER ECB COUNT SELECTIVELY ACTIVATED**

**Explanation:** This is the normal response to the ZDEAT command. This message is followed by a display of the ECB activation table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDEAT command and for an example of the informational display.

**DEAT0004E UNABLE TO DISPLAY ECB ACTIVATION TABLE**

**Explanation:** There are not sufficient resources available to display the ECB activation table.

**System Action:** None.

**User Response:** Enter the ZDEAT command again.

See *TPF Operations* for more information about the ZDEAT command.

**DEAT0005E ZDEAT HAS NO INPUT PARAMETERS**

**Explanation:** The ZDEAT command does not accept any parameters.

**System Action:** None.

**User Response:** Enter the ZDEAT command again and do not specify any parameters.

See *TPF Operations* for more information about the ZDEAT command.

**DECB0005I ECB-***ecbaddr***, EVM-***evmaddr***, SVM-***svmaddr*

**Where:**

*ecbaddr*
The entry control block (ECB) address.

*evmaddr*
The ECB virtual machine (EVM) address.

*svmaddr*
The converted system virtual memory (SVM) address.

**Explanation:** This is the normal response to the ZDECB command with the SVM parameter specified to convert an EVM address to an SVM address.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDECB command.

**DECB0006E ECB NOT IN USE**

**Explanation:** An error occurred when the ZDECB command was entered with an entry control block (ECB) address that is not in use.

**System Action:** The command is rejected.

**User Response:** Enter the ZDECB command again and specify an in-use ECB address.

See *TPF Operations* for more information about the ZDECB command.

**DECB0007E ECB ADDRESS NOT VALID**

**Explanation:** An error occurred when the ZDECB command was entered with an entry control block (ECB) address that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZDECB command again and specify a valid ECB address.

See *TPF Operations* for more information about the ZDECB command.

**DECB0008E UNABLE TO CONVERT EVM ADR** *evmaddr*

**Where:**

*evmaddr*
The ECB virtual machine (EVM) address.

**Explanation:** An error occurred when the ZDECB command was entered with an EVM address that is not in the EVM of the specified entry control block (ECB).

**System Action:** The command is rejected.

**User Response:** Enter the ZDECB command again and specify a valid EVM address for the specified ECB.

See *TPF Operations* for more information about the ZDECB command.

**DECB0009E SORT PARAMETER INPUT NOT VALID**

**Explanation:** An error occurred when the ZDECB command was entered with the Sort parameter specified with a value that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZDECB command again and specify a valid value for the Sort parameter.

See *TPF Operations* for more information about the ZDECB command.

**DECB0010E TOO MANY SORT PARAMETERS INPUT**

**Explanation:** An error occurred when the ZDECB command was entered with more than three Sort parameter values specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZDECB command again and specify as many as three valid values for the Sort parameter.

See *TPF Operations* for more information about the ZDECB command.

**DECB0011I PROGRAM NESTING FOR ECB** *ecbaddr* **STARTED**

**Where:**

*ecbaddr*
The system virtual memory (SVM) address of the entry control block (ECB).

**Explanation:** This is the normal response to the ZDECB command with the NEST parameter specified. The display will be followed by a list of programs that have completed ENTRC macros with no corresponding BACKC macro.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDECB command.

**DECB0012I ANALYZER FOR ECB *ecbaddr* STARTED**

**Where:**

*ecbaddr*
The entry control block (ECB) address.

**Explanation:** This is the normal response to the ZDECB command with an ECB address specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDECB command.

**DECB0013I MACRO TRACE FOR ECB *ecbaddr* STARTED**

**Where:**

*ecbaddr*
The entry control block (ECB) address.

**Explanation:** This is the normal response to the ZDECB command with the MTR parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDECB command.

**DECB0014I DISPLAY ECB SUMMARY**

**Explanation:** This is the normal response to the ZDECB command with any of the following parameters specified:

- ACN
- INPUTS
- OLD
- STAT
- 999.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDECB command.

**DECD0001I DUMP SWITCH TURNED ON**

**Explanation:** This message is issued to indicate that the dump switch was turned on for the record type uniqueness group specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDECD command.

**DECD0002I DUMP SWITCH TURNED OFF**

**Explanation:** This message is issued to indicate that the dump switch was turned off for the record type uniqueness group specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDECD command.

**DECD0003I DUMP SWITCH STATUS – *xxx***

**Where:**

*xxx* The dump switch status (DUMP, NODUMP, or MIXED).

**Explanation:** This message is issued to indicate the current status of the dump switch for the record type uniqueness group specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDECD command.

**DECD0004E INVALID INPUT**

**Explanation:** This message is issued to indicate that there is a problem parsing the command.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZDECD command.
2. Enter the command again and specify the correct format.

See *TPF Operations* for more information about the ZDECD command.

**DECD0005E NO RECORD TYPE UNIQUENESS GROUP FOUND FOR SPECIFIED OPERATION**

**Explanation:** The input record type has no records defined for the particular CPU ID, IS, and subsystem user (SSU) input.

**System Action:** The command is rejected.

**User Response:** Enter the command again for a CPU ID, IS, and SSU for which the record is defined.

See *TPF Operations* for more information about the ZDECD command.

**DECD0006E INVALID RECORD ID OR RECORD VALUE**

**Explanation:** The input RECVAL or RECID is not defined in the TPF system.

**System Action:** The command is rejected.

**User Response:** Enter the command again for a RECVAL or RECID that is defined.

**DECD0007E INVALID I-STREAM NUMBER**

**Explanation:** The input I-stream number is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a valid I-stream.

See *TPF Operations* for more information about the ZDECD command.

**DECD0008E SPECIFIED SSU NOT IN SS**

**Explanation:** The subsystem user (SSU) input is not defined in this subsystem.

**System Action:** The command is rejected.

**User Response:** Enter the command again for an SSU that is defined in this subsystem.

See *TPF Operations* for more information about the ZDECD command.

**DECD0009E INVALID CPUID**

**Explanation:** The input CPU ID is not defined.

**System Action:** The command is rejected.

**User Response:** Enter the command again for a defined CPU ID.

See *TPF Operations* for more information about the ZDECD command.

**DFIL0001E I/O HARDWARE ERROR**

**Segment Reference:** CVB1

**Explanation:** The record that was requested to be displayed or altered could not be retrieved due to an input/output (I/O) hardware error.

**System Action:** The display or alter request is not processed.

**User Response:** Do the following:

1. Refer to the other error messages displayed at the prime computer room agent set (CRAS) console to determine why the record could not be retrieved.
2. Take the appropriate corrective action to resolve the problem.
3. Enter the command again to display or alter the record once the problem is corrected.

See *TPF Operations* for more information about the ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

**DFIL0002E RCD ID CHECK ERROR**

**Segment Reference:** CVB1

**Explanation:** The record that was requested to be displayed or altered could not be retrieved due to a record ID check error.

**System Action:** The display or alter request is not processed.

**User Response:** Be sure:

- The program you are displaying or altering was loaded to the TPF system
- You are running with the correct version of CTKX and the file address compute (FACE) program table (FCTB).

See *TPF Operations* for more information about the ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

**DFIL0003E RCD CODE CHECK ERROR**

**Segment Reference:** CVB1

**Explanation:** The record that was requested to be displayed or altered could not be retrieved due to a record code check error.

**System Action:** The display or alter request is not processed.

**User Response:** Be sure:

- The program you are displaying or altering was loaded to the TPF system
- You are running with the correct version of CTKX and the file address compute (FACE) program table (FCTB).

See *TPF Operations* for more information about the ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

**DFIL0004E INV SHORT—LENGTH**

**Segment Reference:** CVB1

**Explanation:** The record that was requested to be displayed or altered could not be retrieved because the requested record length does not match the actual length of the record.

**System Action:** The display or alter request is not processed.

**User Response:** Be sure:

- The correct version of the file address compute (FACE) program table (FCTB) is loaded to the TPF system
- You are running with the correct version of CTKX
- You have properly formatted your online DASD packs during initial TPF system generation.

See *TPF Operations* for more information about the ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

**DFIL0005E INV LONG—LENGTH**

**Segment Reference:** CVB1

**Explanation:** The record that was requested to be displayed or altered could not be retrieved because the requested record length does not match the actual length of the record.

**System Action:** The display or alter request is not processed.

**User Response:** Be sure:

- The correct version of the file address compute (FACE) program table (FCTB) is loaded to the TPF system
- You are running with the correct version of CTKX
- You have properly formatted your online DASD packs during initial TPF system generation.

See *TPF Operations* for more information about the ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

**DFIL0006E END OF FILE**

**Segment Reference:** CVB1

**Explanation:** The record that was requested to be displayed or altered could not be retrieved because the end of file was reached.

**System Action:** The display or alter request is not processed.

**User Response:** Be sure:

- The correct version of the file address compute (FACE) program table (FCTB) is loaded to the TPF system
- You are running with the correct version of CTKX
- You have properly formatted your online DASD packs during initial TPF system generation.

See *TPF Operations* for more information about the ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

---

**DFIL0007E INVALID FILE ADDRESS**

**Segment Reference:** CVB1

**Explanation:** The record requested to be displayed or altered could not be retrieved because a file address was specified that is not valid.

**System Action:** The display or alter request is not processed.

**User Response:** Be sure:

- The correct version of the file address compute (FACE) program table (FCTB) is loaded to the TPF system
- You are running with the correct version of CTKX
- You enter the command again and specify a valid file address.

See *TPF Operations* for more information about the ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

---

**DFIL0008E MODULE OFF—LINE**

**Segment Reference:** CVB1

**Explanation:** The record that was requested to be displayed or altered resides on a DASD module that is offline.

**System Action:** The display or alter request is not processed.

**User Response:** Do the following:

1. Enter the ZMCPY UP command to bring the DASD module online.
2. Enter the command again once the DASD module is back online.

See *TPF Operations* for more information about the ZDREC, ZAREC, ZDFIL, and ZAFIL commands.

---

**DFIL0011I DISPLAY OF FILE ADDRESS** *fileaddr*

**Where:**

*fileaddr*
The 16-digit hexadecimal file address.

**Explanation:** This is the normal response to the ZDFIL command. This message is followed by a display of the requested data.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDFIL command and for an example of the informational display.

---

**DFPC0002T** *xxxx* **— INVALID REQUEST**

**Where:**

*xxxx*
The request that was not valid.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDFPC command.

---

**DFPC0003I D*tt*–STARTED TO RO**

**Where:**

*tt* The file pool addresses.

**Explanation:** This is the normal response to the ZDFPC command with the D parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDFPC command.

---

**DFPC0004I D*tt*–STOPPED**

**Where:**

*tt* The file pool addresses.

**Explanation:** This is the normal response to the ZDFPC command with the S parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDFPC command.

---

**DFPC0005W D*tt*–ACTIVE**

**Where:**

*tt* The file pool addresses.

**Explanation:** This message is the response to a duplicate time-initiated request.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDFPC command.

---

**DFPC0006W S-INACTIVE**

**Explanation:** You tried to stop a time-initiated display of the ZDFPC command when you did not have the time-initiated function running.

**System Action:** None.

**User Response:** None.

**DFPC0007T FACE ERROR ON ORD-*xxxxxxxx* RECORD TYPE-*yyyyyyyy***

**Where:**

*xxxxxxxx*
The ordinal number.

*yyyyyyyy*
The record type.

**Explanation:** There was a file address compute (FACE) program error.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDFPC command.

**DFPC0008T FIND ERR ON FA-*xxxxxxxx***

**Where:**

*xxxxxxxx*
The file address.

**Explanation:** There was a find error.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDFPC command.

**DFPC0009T CTK9 RET ERR**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDFPC command.

**DFPC0011I AVAILABLE FILE POOL COUNTS**

**Explanation:** This is the normal response to the ZDFPC command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDFPC command and for an example of the informational display.

**DGFL0000E INVALID MESSAGE FORMAT**

**Explanation:** This message is issued for one of the following reasons:

- More than 8 blanks were found before the device address
- More than 8 blanks were between the device address and the end-of-message-complete (EOM) character
- A character other than an EOM was found after the device address.

**System Action:** The request is ignored and the ECB is exited.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZDGFL command.

**DGFL0004E INVALID DEVICE ADDRESS**

**Explanation:** Characters were found in the device address specified that are not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDGFL command.

**DGFL0009E I/O ERROR ON DEVICE *addr***

**Where:**

*addr*
The device address.

**Explanation:** A hardware error occurred while trying to read the label from the device specified in the message.

**System Action:** After the error message is sent, the ECB is exited.

**User Response:** None.

See *TPF Operations* for more information about the ZDGFL command.

**DGFL0024I GENERAL FILE DATA SETS *xx-xx-xx* ARE ON DEVICE *yyyy*, SUBSYSTEM *zzzz***

**Where:**

*xx* The three general file data sets (GDSs) IDs.

*yyyy*
The device name

*zzzz*
The subsystem name.

**Explanation:** This is the normal response to the ZDGFL command, showing the three data set IDs and the subsystem name of the referenced pack.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDGFL command.

**DGFL0025E DEVICE *addr* NOT USABLE**

**Where:**

*addr*
The device address.

**Explanation:** A search on all pseudo modules in the general file record did not find a match.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDGFL command.

---

**DGFL0026I INVALID CHARACTERS IN LABEL ON DEVICE** *addr*

**Where:**

*addr*
The device address.

**Explanation:** The label contains characters other than A through F and 0 through 9 on the device specified in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDGFL command.

---

**DKAT0001I KEYPT** *x* **IS PROC** *yyyy* **AND** *zzz* **RESIDENT KEYPT** *x* **FILE ADDRESS** *faddr* **KEYPT** *x* **CORE ADDRESS** *caddr*

**Where:**

*yyyy*
Either UNIQUE or SHARED.

*zzz* Either BSS or SS.

*faddr*
The file address.

*caddr*
The core address.

**Explanation:** This is a normal response to the ZDKAT command. This message is displayed when the core address is available.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDKAT command.

---

**DKAT0002I KEYPT** *x* **IS PROC** *yyyy* **AND** *zzz* **RESIDENT KEYPT** *x* **FILE ADDRESS** *faddr* **KEYPT** *x* **CORE ADDRESS UNAVAILABLE**

**Where:**

*yyyy*
Either UNIQUE or SHARED.

*zzz* Either BSS or SS.

*faddr*
The file address.

**Explanation:** This is a normal response to the ZDKAT command. This message is displayed when the core address is not available.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDKAT command.

---

**DKAT0003E INVALID MESSAGE SYNTAX USE ZDKAT KP–**

**Explanation:** An error was found in the message parameter field. The correct parameter should be KP*x*, where *x* is a valid keypoint name.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDKAT command.

---

**DKAT0005E USE ZDREC TO DISPLAY CTKX**

**Explanation:** CTKX is no longer a keypoint.

**System Action:** None.

**User Response:** Enter the ZDREC command to display CTKX.

See *TPF Operations* for more information about the ZDKAT command. Also see *TPF System Installation Support Reference* for more information.

---

**DKAT0006E INVALID KEYPT NAME, CHOOSE FROM A,B,C,D,E,I,M,V,0,1,2,3,4,5,6,9**

**Explanation:** The keypoint name specified is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDKAT command.

---

**DKCA0002E INVALID MESSAGE SYNTAX USE ZDKCA KP**

**Explanation:** The format of the command is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the command again using the correct format.

---

**DKCA0003E INVALID KEYPT NAME**

**Explanation:** If a keypoint is shared by all subsystems in a processor, the word SHARED is appended to the response.

**System Action:** None.

**User Response:** None.

---

**DKFA0001E INVALID SYNTAX, USE ZDKFA KP**

**Explanation:** The format of the command is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the command again using the correct format.

---

**DKFA0002E INVALID KEYPT NAME**

**Explanation:** The keypoint name is not valid.

**System Action:** None.

**User Response:** None.

**DLOK0001E NOT ENOUGH MALLOC STORAGE FOR DEADLOCK DETECTION**

**Explanation:** There is not enough `malloc` storage available for deadlock detection processing.

**System Action:** The deadlock detection program ends.

**User Response:** Do the following:

1. Enter the ZCTKA ALTER command with the ESPS or MSHS parameter specified to increase the `malloc` storage.
2. IPL the TPF system again.

See *TPF Application Programming* for more information about deadlock detection. See *TPF Operations* for more information about the ZCTKA ALTER command.

**DLOK0002I INCORRECT RETURN CODE FROM USER EXIT, NO ACTION IS TAKEN**

**Explanation:** An incorrect return code is returned from the CLUD deadlock detection user exit. Valid return codes are 0, 4, and 8.

**System Action:** The deadlock detection program (CL40) ends.

**User Response:** Update the CLUD user exit to return a valid return code.

See *TPF Application Programming* for more information about deadlock detection.

# DMAP–DNSS

**DMAP0001I LINK MAP DATA DISPLAY *ccccvv* ACTIVE IN LOADSET *lsnameb* C LOAD MODULE ADDRESS - *address* C LOAD MODULE SIZE - *size***

**Where:**

*ccccvv*
The name and version of the C load module.

*lsnameb*
The name of the loadset or BASE.

*address*
Main storage address of the C load module (in hexadecimal).

*size* Size of the C load module (in hexadecimal).

**Explanation:** This is the normal response for the ZDMAP command. This message is followed by a display of the link map data for the specified C load module.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDMAP command.

**DMAP1000E LOADSET *lsname* IS NOT VALID. IT MUST BE GREATER THAN 4 CHARACTERS IF THE LOADSET NAME IS NOT BASE.**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The loadset name must be from 5 to 8 characters with the exception of a loadset name of BASE.

**System Action:** No link map data is displayed.

**User Response:** Enter the ZDMAP command again with the LOADSET parameter specifying a valid loadset name that is 5 to 8 characters long.

See *TPF Operations* for more information about the ZDMAP command.

**DMAP1001E INPUT MESSAGE FORMAT INCORRECT. ENTER ZDMAP HELP TO SEE THE CORRECT FORMAT.**

**Explanation:** The format of the ZDMAP command is not correct.

**System Action:** The ZDMAP command is rejected.

**User Response:**

1. Determine the correct format of the ZDMAP command.
2. Enter the ZDMAP command again using the correct format.

See *TPF Operations* for more information about the ZDMAP command.

**DMAP2000E PROGRAM *prognamevv* IS NOT A C LOAD MODULE**

**Where:**

*prognamevv*
The name and version of the program.

**Explanation:** One of the following errors occurred:

- The ZDMAP command was entered with a program name specified that is not a C load module. Link map data is available only for C load modules.
- You may have specified the C load module name incorrectly when you entered the ZDMAP command.

**System Action:** No link map data is displayed.

**User Response:** Do one of the following:

- If you specified the correct program name with the ZDMAP command, there is no more action for you to take. The program is not a C load module.
- If you specified an incorrect program name, enter the ZDMAP command again specifying a valid C load module name.

- If the base version of the program or the version in any active loadset is a C load module, enter the ZDMAP command with the LOADSET parameter specified to display that version.

See *TPF Operations* for more information about the ZDMAP command.

---

**DMAP2001E FIND ERROR ON *eee* RECORD. CANNOT PROCESS ZDMAP REQUEST.**

**Where:**

*eee* The E-type loader (ELDR) record, which can be the ELDR master record (EMR), ELDR program directory (EPD) record, or ELDR loadset directory (LSD) record.

**Explanation:** An input/output (I/O) error occurred while trying to access one of the E-type loader (ELDR) file records for processing the ZDMAP command.

**System Action:** No link map data is displayed.

**User Response:** Review any previous error messages for information about the type of error that occurred.

See *TPF Operations* for more information about the ZDMAP command.

---

**DMAP2002E LOADSET PARAMETER VALID ONLY AFTER E-TYPE LOADER RESTART HAS COMPLETED**

**Explanation:** The ZDMAP command was entered with the LOADSET parameter specified before E-type loader restart ended.

**System Action:** No link map data is displayed.

**User Response:** Do one of the following:

- Wait until E-type loader (ELDR) restart has completed and enter the ZDMAP command again.
- Enter the ZDMAP command again without the LOADSET parameter specified.

See *TPF Operations* for more information about the ZDMAP command.

---

**DMAP2003E LOADSET PARAMETER VALID ONLY WHEN E-TYPE LOADER RECORDS HAVE BEEN ALLOCATED**

**Explanation:** No E-type loader records (#OLDx) are defined for the TPF system. Therefore, you cannot specify the LOADSET parameter when you enter the ZDMAP command.

**System Action:** No link map data is displayed.

**User Response:** Enter the ZDMAP command again and do not specify the LOADSET parameter.

See *TPF Operations* for more information about the ZDMAP command.

---

**DMAP2004E PROGRAM *progname* NOT FOUND**

**Where:**

*progname*
The name of the program.

**Explanation:** One of the following errors occurred:

- The ZDMAP command was entered with the LOADSET parameter specified with a value of BASE for a program that is not allocated.
- The ZDMAP command was entered without the LOADSET parameter specified for a program that is not allocated.
- You may have entered the program name incorrectly.

**System Action:** No link map data is displayed.

**User Response:** Do one of the following:

- Enter the ZDMAP command again and specify the name of a program that is allocated.
- The program could be an unallocated program in an inactive loadset. Do the following to determine if this is the case:
  1. Enter the ZOLDR DISPLAY PROG command specifying the program name. This will show the loadsets, if any, in which that program is contained.
  2. Enter the ZOLDR ACTIVATE command to activate the loadset that contains the program.
  3. Enter the ZDMAP command again and specify the unallocated program name.
- If you specified an incorrect program name, enter the ZDMAP command again and specify a valid program name.

See *TPF Operations* for more information about the ZDMAP, ZOLDR ACTIVATE, and ZOLDR DISPLAY commands.

---

**DMAP2005E PROGRAM *progname* IS UNALLOCATED. CANNOT PROCESS BASE VERSION**

**Where:**

*progname*
The name of the program.

**Explanation:** The ZDMAP command was entered with the LOADSET parameter value of BASE specified for a program that is not allocated. Unallocated programs do not have a base version.

**System Action:** No link map data is displayed.

**User Response:** Do one of the following:

- Enter the ZDMAP command again specifying the name of a program that is allocated.
- At the time the ZDMAP command was entered, a version of the program was found in a loadset. To display the link map data for a version other than the base version, do the following:
  1. Enter **ZDPAT** *progname* **COPY-C** (where *progname* is the program name) to display which versions of the program are available.
  2. Do one of the following:
     – If the ZDPAT display shows that no versions of the program are available, the loadset containing the

program is no longer in use and the program is no longer available. There is no more action for you to take.

– If the ZDPAT display shows that versions of the program are available, do one of the following:
  - Enter the ZDMAP command with the LOADSET parameter specifying a loadset that contains an available version of the program.
  - Enter the ZDMAP command without the LOADSET parameter.

See *TPF Operations* for more information about the ZDMAP and ZDPAT commands.

---

**DMAP2006E LOADSET *lsname* DOES NOT EXIST**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The ZDMAP command was entered with the LOADSET parameter specified for a specific loadset name that could not be found.

**System Action:** No link map data is displayed.

**User Response:** Do the following:

1. Enter **ZOLDR DISPLAY ALL** to display information about all the loadsets.
2. Enter the ZDMAP command again with the LOADSET parameter specifying a valid loadset name.

See *TPF Operations* for more information about the ZDMAP and ZOLDR DISPLAY commands.

---

**DMAP2007E LOADSET *lsname* IS BEING LOADED. CANNOT PROCESS ZDMAP REQUEST.**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The ZDMAP command was entered with the LOADSET parameter specified for a specific loadset name that is currently being loaded. You cannot display link map data for any programs contained in that loadset.

**System Action:** No link map data is displayed.

**User Response:** Enter the ZDMAP command again after the loadset is loaded.

See *TPF Operations* for more information about the ZDMAP command.

---

**DMAP2008E LOADSET *lsname* IS BEING ACCEPTED. ENTER ZDMAP AGAIN WITH THE LOADSET PARAMETER SPECIFYING A VALUE OF BASE**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The ZDMAP command was entered with the LOADSET parameter specified for a specific loadset name that is currently being accepted because of a previous ZOLDR ACCEPT command. You cannot display link map data for any programs contained in that loadset. The TPF system considers programs in that loadset to be part of the base version.

**System Action:** No link map data is displayed.

**User Response:** Enter the ZDMAP command again and specify the LOADSET parameter with a value of BASE.

See *TPF Operations* for more information about the ZDMAP and ZOLDR ACCEPT commands.

---

**DMAP2009E LOADSET *lsname* IS BEING DELETED. CANNOT PROCESS ZDMAP REQUEST.**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The ZDMAP command was entered with the LOADSET parameter specified for a specific loadset name that is marked for deletion and can no longer be accessed. You cannot display link map data for any programs contained in that loadset.

**System Action:** No link map data is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZDMAP command.

---

**DMAP2010E PROGRAM *progname* DOES NOT EXIST IN LOADSET *lsname***

**Where:**

*progname*
The name of the program.

*lsname*
The name of the loadset.

**Explanation:** The ZDMAP command was entered with the LOADSET parameter specified for a specific loadset name, but the requested program is not in that loadset. Either the program name is valid but is not in the specified loadset or the loadset is valid but does not contain the specified program.

**System Action:** No link map data is displayed.

**User Response:** Do the following:

1. Enter **ZOLDR DISPLAY PROG** specifying the program name. This will show the loadsets, if any, in which that program is contained.
2. Enter the ZDMAP command again with the LOADSET parameter specifying the name of the loadset that contains the program for which you want to display link map data.

See *TPF Operations* for more information about the ZDMAP and ZOLDR DISPLAY commands.

---

**DMAP2011E PROGRAM *progname* IS EXCLUDED FROM LOADSET *lsname*. CANNOT PROCESS ZDMAP REQUEST.**

**Where:**

*progname*
The name of the program.

*lsname*
The name of the loadset.

**Explanation:** The ZDMAP command was entered with the LOADSET parameter specified for a specific loadset name to display link map data for a program. However, the program has been excluded from the loadset.

**System Action:** No link map data is displayed.

**User Response:** Do the following:

1. Do one of the following:
   - If the loadset is active, enter the ZOLDR DEACTIVATE command to deactivate the loadset. Then continue with step 2.
   - If the loadset is not active, go to step 2.
2. Enter the ZOLDR REINCLUDE command to restore the program to the loadset.
3. Enter the ZOLDR ACTIVATE command to activate the loadset.
4. Enter the ZDMAP command again with the LOADSET parameter specifying the loadset name.

See *TPF Operations* for more information about the ZDMAP, ZOLDR ACTIVATE, ZOLDR DEACTIVATE, and ZOLDR REINCLUDE commands.

---

**DMAP2012E LOADSET *lsname* IS NOT ACTIVE**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The ZDMAP command was entered with the LOADSET parameter specified with a specific loadset name to display link map data for a program. However, the loadset is not active.

**System Action:** No link map data is displayed.

**User Response:** Do the following:

1. Enter the ZOLDR ACTIVATE command to activate the loadset.
2. Enter the ZDMAP command again with the LOADSET parameter specifying the loadset name.

See *TPF Operations* for more information about the ZDMAP and ZOLDR ACTIVATE commands.

---

**DMAP2013E NO ACTIVE VERSIONS OF UNALLOCATED PROGRAM *progname* AVAILABLE HERE**

**Where:**

*progname*
The name of the program.

**Explanation:** One of the following errors occurred:

- The ZDMAP command was entered for an unallocated program that is contained in a selectively activated loadset. However, this loadset is not enabled for the entry control block (ECB) that is processing the ZDMAP request.
- The ZDMAP command was entered without the LOADSET parameter specified for a program that is unallocated and is contained in an inactive loadset.

**System Action:** No link map data is displayed.

**User Response:** Enter **ZDPAT *progname* COPY-C** (where *progname* is the program name) to display the versions of the program that are available and do one of the following:

- If the ZDPAT display shows that the program is contained in a selectively activated loadset:
  1. Enable the ECB origin to allow the ECB that is processing the ZDMAP request to use this loadset.
  2. Enter the ZDMAP command again.
- If the ZDPAT display shows that no versions of the program are available, the loadset containing the program is no longer in use and the program is no longer available. Do the following:
  1. Enter the ZOLDR ACTIVATE command to activate the loadset.
  2. Enter the ZDMAP command again with the LOADSET parameter specifying the specific loadset name.
- If the ZDPAT display shows that versions of the program are available, enter the ZDMAP command with the LOADSET parameter specifying a loadset that contains an available version of the program.

See *TPF Operations* for more information about the ZDMAP, ZDPAT, and ZOLDR ACTIVATE commands.

---

**DMAP2014E UNABLE TO LOCK PROGRAM *prognamevv* IN LOADSET *lsnameb* INTO MAIN STORAGE. CANNOT PROCESS ZDMAP REQUEST. GETPC RETURN CODE - *rc***

**Where:**

*prognamevv*
The name and version of the program.

*lsnameb*
The name of the loadset or BASE.

*rc* The return code from the `getpc` function.

**Explanation:** One of the following errors occurred:

- Either the program name in the program allocation table (PAT) entry does not agree with the program name in the program record header or the record ID in the program record header is not X'00FF'.

  This error indicates that the program was not loaded to file or that the file copy was corrupted.
- The program was not reloaded after the master extra program record was initialized (using a LOADER PROG-MOD-BASE CLEAR card in a general file (ALDR) loader load deck or an auxiliary loader (TLDR) load deck). Therefore, the program ordinals in the #XPRGn record type are not valid.

- During C load module retrieval processing, an attempt to translate an ordinal number in the C load module to a file address was unsuccessful.
- There is not enough space in the system heap storage to hold the C load module that the TPF system is trying to retrieve from DASD to main storage.

**System Action:** No link map data is displayed.

**User Response:** Determine the cause of the problem and do one of the following:

- If a program name or record ID mismatch occurs do the following:
  1. Determine why the record header is not correct.
  2. If necessary, load the program again.
- If the program was not reloaded after the master extra program record was initialized, do one of the following:
  - Load the program again using the general file loader (ALDR).
  - Load the program again using the auxiliary loader (TLDR).
  - Accept a new version of the program using the E-type loader (OLDR).
- If an error calculating the file address of a program record occurs, do the following:
  1. Determine the cause of the ordinal number corruption.
  2. Reload all of the C load modules in the TPF system and include the LOADER PROG-MOD-BASE CLEAR card in the load deck to ensure that all ordinal numbers in use are correct.
- If there was not enough storage to retrieve the program, do the following:
  1. Determine if the program is defined as file or core resident.
     - If the program is defined as core resident, increase the size of the core resident program area (CRPA) by entering the ZCTKA command.
     - If the program is defined as file resident, increase the size of the system heap storage by entering the ZCTKA command.
  2. IPL the TPF system again.

See *TPF Operations* for more information about the ZDMAP and ZCTKA commands. See the *TPF C/C++ Language Support User's Guide* for more information about the return codes from the `getpc` function. See *TPF System Installation Support Reference* for more information about loaders.

---

**DMAP2015E UNEXPECTED GETPC ERROR FOR PROGRAM *progname*. CANNOT PROCESS ZDMAP REQUEST. GETPC RETURN CODE - *rc***

**Where:**

*progname*
The name of the program.

*rc* The return code from the `getpc` function.

**Explanation:** The ZDMAP command was entered without the LOADSET parameter specified. ZDMAP processing issued the `getpc` function to determine which version of the program to display and `getpc` returned with an error. Because the `getpc` function was issued with NO_LOCK specified, this error is unexpected.

**System Action:** No link map data is displayed.

**User Response:** Have your system programmer determine the cause of the error and correct it.

See *TPF Operations* for more information about the ZDMAP command. See the *TPF C/C++ Language Support User's Guide* for more information about the return codes from the `getpc` function.

---

**DMAP3000E C LOAD MODULE *ccccvv* IN LOADSET *lsnameb* CONTAINS NO LINK MAP DATA**

**Where:**

*ccccvv*
The name and version of the C load module.

*lsnameb*
The name of the loadset or BASE.

**Explanation:** This error occurs in response to a ZDMAP command when the C load module specified does not contain any link map data.

**System Action:** No link map data is displayed.

**User Response:** Do the following:

1. Rebuild the C load module offline so that it contains link map data.
2. Reload the C load module.

See *TPF Application Programming* for more information about including link map data when building C load modules. See *TPF Operations* for more information about the ZDMAP command.

---

**DMAP3001E NO MATCH FOUND IN C LOAD MODULE *ccccvv* IN LOADSET *lsnameb* FOR OBJECT FILE *objname***

**Where:**

*ccccvv*
The name and version of the C load module.

*lsnameb*
The name of the loadset or BASE.

*objname*
The name of the requested object file.

**Explanation:** This error occurs when the object file name specified with the ZDMAP command is not found in the specified C load module.

**System Action:** No link map data is displayed.

**User Response:** Do one of the following:

- Enter the ZDMAP command again without specifying the OBJFILE parameter to display all object files contained in the specific C load module.
- Enter the ZDMAP command again specifying the OBJFILE parameter with the particular object file name for which you want link map data.

See *TPF Operations* for more information about the ZDMAP command.

**DMAP3002E NO MATCH FOUND IN C LOAD MODULE** *ccccvv* **IN LOADSET** *lsnameb* **FOR FUNCTION** *funcname*

**Where:**

*ccccvv*
The name and version of the C load module.

*lsnameb*
The name of the loadset or BASE.

*funcname*
The name of the requested function.

**Explanation:** This error occurs when the function name specified with the ZDMAP command is not found in the specified C load module.

**System Action:** No link map data is displayed.

**User Response:** Do one of the following:

- Enter the ZDMAP command again specifying the FUNCTION parameter with an asterisk (*) as a wildcard character to display all functions contained in the specific C load module.
- Enter the ZDMAP command again with the FUNCTION parameter specified with the particular function name for which you want link map data.

See *TPF Operations* for more information about the ZDMAP command.

---

**DMAP3003E ADDRESS** *address* **IS NOT IN C LOAD MODULE** *ccccvv* **IN LOADSET** *lsnameb*

**Where:**

*address*
The hexadecimal address entered with the ADDRESS parameter of the ZDMAP command.

*ccccvv*
The name and version of the C load module.

*lsnameb*
The name of the loadset or BASE.

**Explanation:** One of the following errors occurred:

- The address specified with the ZDMAP command is not contained in the specified C load module.
- The C load module entered with the ZDMAP command is not locked in main storage.

**System Action:** No link map data is displayed.

**User Response:** Do one of the following:

- Enter the ZDMAP command again with the ADDRESS parameter specifying an address that is valid in the C load module.
- Enter the ZRPGM command to lock the C load module in main storage. Then, enter the ZDMAP command again with the ADDRESS parameter specifying an address that is valid in the C load module.

See *TPF Operations* for more information about the ZDMAP and ZRPGM commands.

---

**DMAP3004E NOT ENOUGH MALLOC STORAGE AVAILABLE TO PROCESS ALL LINK MAP DATA FOR C LOAD MODULE** *ccccvv*

**Where:**

*ccccvv*
The name and version of the C load module.

**Explanation:** While processing the ZDMAP command, there was not enough storage available to fully process the request for all the link map data requested.

**System Action:** No link map data is displayed.

**User Response:** Do one of the following:

- Enter the ZDMAP command again when there is less TPF system activity.
- Enter the ZDMAP command again and specify the OBJFILE or FUNCTION parameter to limit the amount of link map data to display.

See *TPF Operations* for more information about the ZDMAP command.

---

**DMAP3005E C LOAD MODULE** *ccccvv* **IN LOADSET** *lsnameb* **CONTAINS LINK MAP DATA THAT CANNOT BE RECOGNIZED. CANNOT PROCESS ZDMAP REQUEST.**

**Where:**

*ccccvv*
The name and version of the C load module.

*lsnameb*
The name of the loadset or BASE.

**Explanation:** This error occurs in response to a ZDMAP command when the C load module specified contains link map data that is in a format that is not recognized by the ZDMAP command.

**System Action:** No link map data is displayed.

**User Response:** Do the following:

1. Rebuild the C load module offline so that it contains link map data in a recognized format.
2. Reload the C load module.

See *TPF Application Programming* for more information about including link map data when building C load modules. See *TPF Operations* for more information about the ZDMAP command.

---

**DMFS0005I** *hh.mm.ss*

**Where:**

*hh* The hour.

*mm* The minute.

*xx* The second.

**Explanation:** This is the normal response to the ZDMFS DISPLAY command. This message displays the module numbers, error counts, and lock status.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDMFS command and an example of the informational display.

---

**DMFS0006I** *mod* **AND FOLLOWING MODS OFFLINE**

**Where:**

*mod*
The module name.

**Explanation:** The ONLINE option is specified in the ZDMFS command when the requested module and all following modules are offline.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDMFS and ZSONS commands.

---

**DMFS0054E INVALID STARTING MODULE NUMBER**

**Explanation:** The specified starting module number is:

- Not valid
- Reserved by the TPF system to be used as a general file module.

It can be accessed only by specifying pseudo numbers in the ZDMFS command.

**System Action:** None.

**User Response:** If you are not certain that the last displayed module number represents the largest valid module number in the installation, increase the last module number by one and enter it as the starting module number in a subsequent request. The program responds with the DMFS0054E error message. For example, you can specify the starting module number 0F1 in the ZDMFS command. The highest valid module number in the installation is 0F2. The limit of output lines is 5. Only two lines are printed since symbolic, or pseudo module number, 0F3 does not exist in the particular installation.

See *TPF Operations* for more information about the ZDMFS and ZSONS commands.

---

**DNSC0001E ERROR ALLOCATING IDNSHOSTADDR CACHE**

**Explanation:** There is not enough contiguous system heap storage available to obtain the amount requested for the IDNSHOSTADDR Domain Name System (DNS) client cache.

**System Action:** The TPF system will call the external DNS server for all gethostbyaddr() function calls.

**User Response:** Do one of the following:

- Enter the ZCTKA ALTER command to increase the amount of system heap storage and then IPL the TPF system.
- Enter the ZCACH command to decrease the IDNSHOSTADDR client cache and then IPL the TPF system.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support. See *TPF Operations* for more information about the ZCACH and ZCTKA ALTER commands and increasing system heap storage.

---

**DNSC0002I IDNSHOSTADDR CLIENT CACHE INITIALIZED**

**Explanation:** The TPF Domain Name System (DNS) client cache, which saves remote Internet protocol (IP) addresses and their corresponding remote host names, has been initialized.

**System Action:** None.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSC0003E ERROR ALLOCATING IDNSHOSTNAME CACHE**

**Explanation:** There is not enough contiguous system heap storage available to obtain the amount requested for the IDNSHOSTNAME Domain Name System (DNS) client cache.

**System Action:** The TPF system will call the external DNS server for all gethostbyname() function calls.

**User Response:** Do one of the following:

- Enter the ZCTKA ALTER command to increase the amount of system heap storage then IPL the TPF system.
- Enter the ZCACH command to decrease the IDNSHOSTADDR client cache then IPL the TPF system.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support. See *TPF Operations* for more information about the ZCACH and ZCTKA ALTER commands and increasing system heap storage.

---

**DNSC0004I IDNSHOSTNAME CLIENT CACHE INITIALIZED**

**Explanation:** The TPF Domain Name System (DNS) client cache, which saves remote host names and their corresponding Internet protocol (IP) addresses, has been initialized.

**System Action:** None.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSC0005E SYSTEM HEAP NOT OBTAINED,** *name* **TABLE NOT CREATED**

**Where:**

*name*
The name of a file containing external host names and associated IP addresses, which may be used to resolve gethostbyaddr() or gethostbyname() function calls.

**Explanation:** An attempt was made to create the TPF external host name table by writing the file to system heap storage. However, there was not enough contiguous system heap storage available to obtain the amount requested.

**System Action:** The TPF system will not use the file to resolve gethostbyaddr() or gethostbyname() function calls, but

will resolve the function calls by calling the Domain Name System (DNS) external server or by reading the data from the IDNSHOSTADDR DNS client cache for gethostbyaddr() function calls or from the IDNSHOSTNAME DNS client cache for gethostbyname() function calls.

**User Response:** Do the following:

1. Enter the ZCTKA ALTER command to increase the amount of system heap storage.
2. IPL the TPF system.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support. See *TPF Operations* for more information about the ZCTKA ALTER command and increasing system heap storage.

---

**DNSC0006E SYSTEM HEAP NOT OBTAINED,** *name* **TABLE NOT REFRESHED**

**Where:**

*name*
The name of a file containing external host names and associated IP addresses, which may be used to resolve gethostbyaddr() or gethostbyname() function calls.

**Explanation:** An attempt was made to refresh the TPF external host name table by writing the file to system heap storage. However, there was not enough contiguous system heap storage available to obtain the amount requested.

**System Action:** The TPF external host name table in system heap storage is not changed.

**User Response:** Do the following:

1. Enter the ZCTKA ALTER command to increase the amount of system heap storage.
2. IPL the TPF system.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support. See *TPF Operations* for more information about the ZCTKA ALTER command.

---

**DNSC0007E** *name* **TABLE NOT CREATED, LAST VALID HOST NAME IS** *hostname*

**Where:**

*name*
The name of a file containing external host names and associated IP addresses, which may be used to resolve gethostbyaddr() or gethostbyname() function calls.

*hostname*
The last valid host name in the file.

**Explanation:** An attempt was made to create the TPF external host name table by writing the file to system heap storage. However, the TPF system detected an error while parsing the file. The last valid host name in the file is displayed.

**System Action:** The TPF system will not use the TPF external host name table to resolve gethostbyaddr() or gethostbyname() function calls, but will resolve the function calls by calling the Domain Name System (DNS) external server or by reading the data from the IDNSHOSTADDR DNS client cache for gethostbyaddr() function calls or from the IDNSHOSTNAME DNS client cache for gethostbyname() function calls.

**User Response:** Create a valid DNS host name file.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSC0008E** *name* **TABLE NOT REFRESHED, LAST VALID HOST NAME IS** *hostname*

**Where:**

*name*
The name of a file containing host names and associated Internet Protocol (IP) addresses, which may be used to resolve gethostbyaddr() or gethostbyname() function calls.

*hostname*
The last valid host name in the file.

**Explanation:** An attempt was made to refresh the TPF external host name table by writing the updated file to system heap storage. However, the TPF system detected an error while parsing the file. The last valid host name in the file is displayed.

**System Action:** The TPF external host name table in system heap storage is not changed.

**User Response:** Create a valid Domain Name System (DNS) host name file.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSC0009E** *name* **TABLE NOT CREATED, LAST VALID HOST NAME FOUND**

**Where:**

*name*
The name of a file containing host names and associated Internet Protocol (IP) addresses, which may be used to resolve gethostbyaddr() or gethostbyname() function calls.

**Explanation:** An attempt was made to create the TPF external host name table by writing the file to system heap storage. However, the TPF system detected an error while parsing the file.

**System Action:** The TPF system will not use the TPF external host name table to resolve gethostbyaddr() or gethostbyname() function calls, but will resolve the function calls by calling the Domain Name Server (DNS) external server or by reading the data from the IDNSHOSTADDR DNS client cache for gethostbyaddr() function calls or from the IDNSHOSTNAME DNS client cache for gethostbyname() function calls.

**User Response:** Create a valid DNS host name file.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSC0010E** *name* **TABLE NOT REFRESHED, NO VALID HOST NAME FOUND**

**Where:**

*name*
The name of a file containing external host names and

associated Internet Protocol (IP) addresses, which may be used to resolve gethostbyaddr() or gethostbyname() function calls.

**Explanation:** An attempt was made to refresh the TPF external host name table by writing the file to system heap storage. However, the TPF system detected an error while parsing the file.

**System Action:** The TPF system will not use the TPF external host name table to resolve gethostbyaddr() or gethostbyname() function calls, but will resolve the function calls by calling the Domain Name System (DNS) external server or by reading the data from the IDNSHOSTADDR DNS client cache for gethostbyaddr() function calls or from the IDNSHOSTNAME DNS client cache for gethostbyname() function calls.

**User Response:** Create a valid DNS host name file.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSC0011I** *name* **FILE HAS BEEN WRITTEN TO SYSTEM HEAP**

**Where:**

*name*
The name of a file containing external host names and associated IP addresses, which may be used to resolve gethostbyaddr() or gethostbyname() function calls.

**Explanation:** The file has been written to system heap storage.

**System Action:** None.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSS0001E** **DNS SERVER HOSTNAME TABLE NOT REFRESHED LAST VALID HOSTNAME IN FILE** *name* **IS** *host name*

**Where:**

*name*
The name of the Domain Name System (DNS) server host name file.

*host name*
The first 40 characters of the last host name that was successfully processed from the DNS host name file.

**Explanation:** An attempt was made to refresh the TPF host name table in system heap storage with data from an updated file. However, an error occurred during the process. The last host name that was successfully processed from the DNS host name file is displayed.

**System Action:** The host name table in system heap storage is not changed.

**User Response:** Create a valid DNS host name file.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSS0002E** **DNS SERVER FILE** *name* **DOES NOT EXIST**

**Where:**

*name*
The name of the Domain Name System (DNS) server host name file.

**Explanation:** An attempt was made to copy the TPF host name file to system heap, but the host name file does not exist.

**System Action:** The DNS server host name table, if already created in system heap storage, is not changed.

**User Response:** Create a valid DNS host name file.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSS0003E** **DNS SERVER HOSTNAME TABLE NOT REFRESHED FIRST HOSTNAME IN FILE** *name* **IS NOT VALID**

**Where:**

*name*
The name of the Domain Name System (DNS) server host name file.

**Explanation:** An attempt was made to refresh the TPF host name table in system heap storage with data from an updated file. However, an error occurred on the first host name in the file.

**System Action:** The host name table in system heap storage is not changed.

**User Response:** Create a valid DNS host name file.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSS0004I** **DNS SERVER HOSTNAME TABLE REFRESH COMPLETED**

**Explanation:** The Domain Name System (DNS) server host name table was refreshed in system heap.

**System Action:** None.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSS0005E** **DNS SERVER ERROR OPENING FILE** *name* **ERRNO** *description*

**Where:**

*name*
The name of the Domain Name System (DNS) server host name file.

*description*
The `errno` function value.

**Explanation:** An error occurred when trying to open the DNS server host name file located in the TPF file system.

**System Action:** The DNS server host name table, if already created in system heap storage, is not changed.

**User Response:** Look in `errno.h` to see a description of the error and do one of the following:

- If the error indicates a file access permission error:
  - Enter **ZFILE ls -l** for /etc/host.txt to get the current file access permission settings.
- If the file has read permission set:
  - See your system programmer.
- If the file does not have read permission set:
  - Enter the ZFILE chmod command to set read permission for /etc/host.txt file.

See *TPF Operations* for more information about the ZFILE chmod command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSS0006E DNS SERVER HOSTNAME TABLE NOT CREATED FIRST HOSTNAME IN FILE *name* IS NOT VALID**

**Where:**

*name*
The name of the Domain Name System (DNS) server host name file.

**Explanation:** An attempt was made to initialize the TPF host name table in system heap storage with data from an updated file. However, an error occurred on the first host name in the file.

**System Action:** The DNS server host name table is not created in system heap.

**User Response:** Create a valid DNS host name file.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSS0007E DNS SERVER HOSTNAME TABLE NOT REFRESHED ERROR ALLOCATING SYSTEM HEAP**

**Explanation:** An attempt was made to refresh the TPF host name table in system heap storage from an updated file. However, there is not enough contiguous system heap storage available to obtain the amount requested.

**System Action:** The host name table in system heap storage is not changed.

**User Response:** Do the following:

1. Enter the ZCTKA ALTER command to increase the amount of system heap storage.
2. IPL the TPF system.

See *TPF Operations* for more information about the ZCTKA ALTER command and increasing system heap storage. See *TPF Transmission Control Protocol/Internet Protocol* for more information about Domain Name System (DNS) support.

---

**DNSS0008E DNS SERVER HOSTNAME TABLE NOT CREATED ERROR ALLOCATING SYSTEM HEAP**

**Explanation:** An attempt was made to create the DNS server host name table in system heap storage from the DNS server host name file, /etc/host.txt, in the TPF file system. However, there was not enough contiguous system heap storage available to obtain the amount requested.

**System Action:** The Domain Name System (DNS) server host name table is not created in system heap storage.

**User Response:** Do the following:

1. Enter the ZCTKA ALTER command to increase the amount of system heap storage.
2. IPL the TPF system.

See *TPF Operations* for more information about the ZCTKA ALTER command and increasing system heap storage. See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSS0009E DNS SERVER HOSTNAME TABLE NOT CREATED LAST VALID HOSTNAME IN FILE *name* IS *host name***

**Where:**

*name*
The name of the Domain Name System (DNS) server host name file.

*host name*
The first 40 characters of the last host name that was successfully processed from the DNS host name file.

**Explanation:** An attempt was made to copy the TPF host name table to system heap storage from a file in the TPF file system. However, an error occurred during the process. The last valid host name in the file is displayed.

**System Action:** The TPF DNS server is stopped.

**User Response:** Create a valid DNS host name file.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSS0010E DNS SERVER IS ONLY ALLOWED TO RUN FROM THE BSS**

**Explanation:** An attempt was made to start the Domain Name System (DNS) server from a subsystem other than the basic subsystem (BSS).

**System Action:** The TPF DNS server is stopped.

**User Response:** Do the following:

1. Enter the ZINET DELETE command from the other subsystem to remove the DNS server entry for the Internet daemon (INETD) table of that subsystem.
2. Enter the ZINET ADD command from the BSS to define the DNS server to the BSS INETD table.
3. Enter the ZINET START command from the BSS to activate the DNS server.

See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

---

**DNSS0011E DNS SERVER ERROR ON RECVFROM ERRNO** *error_number*

**Where:**

*error_number*
The value of the sock_errno() function.

**Explanation:** An error occurred when a recvfrom() function attempted to read a Domain Name System (DNS) query.

**System Action:** The DNS server socket is closed and Internet daemon (INETD) processing restarts the DNS server.

**User Response:** See socket.h for a description of the error number value.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

**DNSS0012E DNS SERVER HOSTNAME TABLE DOES NOT EXIST**

**Explanation:** The Domain Name System (DNS) server has detected that the DNS server host name table has not been created.

**System Action:** The TPF DNS server is stopped.

**User Response:** Do one of the following:

- If the file does not exist, create a valid host name file.
- If the file exists with bad entries, correct it
- Enter the ZCTKA ALTER command to increase the amount of system heap storage.

See *TPF Operations* for more information about the ZCTKA ALTER command and how to increase system heap storage. See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

**DNSS0013I DNS SERVER HOST NAME TABLE INITIALIZATION COMPLETED**

**Explanation:** The TPF host name table was initialized from the Domain Name System (DNS) server host name file.

**System Action:** None.

**User Response:** None

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

**DNSS0015E DNS SERVER MUST HAVE INETD SERVER NAME SET TO DNS**

**Explanation:** The Domain Name System (DNS) server detected that a server entry with a name other than DNS (the only supported server name) was defined for the Internet daemon (INETD).

**System Action:** The TPF DNS server is stopped.

**User Response:** Do the following:

1. Enter the ZINET DELETE command to delete the incorrect INETD entry.
2. Enter the ZINET ADD command using DNS as the server name.
3. Enter the ZINET START command to start the DNS server again.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about offload and native stack support. See *TPF Operations* for more information about the ZINET commands.

**DNSS0016E DNS SERVER ERROR READING FILE** *name* **ERRNO** *description*

**Where:**

*name*
The name of the Domain Name System (DNS) server host name file.

*description*
The errno function value.

**Explanation:** An attempt was made to read a file in the TPF file system, but the TPF system could not access the file.

**System Action:** The TPF DNS server is not started.

**User Response:** Have your system programmer determine the cause of the problem and correct the error.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about DNS support.

# DPAT–DSMG

**DPAT0005E INVALID PROGRAM NAME**

**Explanation:** The program name specified with the ZDPAT command is not valid for one of the following reasons:

- The program specified was not found.
- The program name specified did not contain 4 alphanumeric characters.

**System Action:** The ZDPAT command is rejected.

**User Response:** Do the following:

1. Verify the program name.
2. Enter the ZDPAT command again and specify the correct program name.

See *TPF Operations* for more information about the ZDPAT command.

**DPAT0010E INVALID COPY OPTION**

**Explanation:** The copy option specified with ZDPAT command is not valid.

**System Action:** The ZDPAT command is rejected.

**User Response:** Do the following:

1. Verify the copy option.
2. Enter the ZDPAT command again and specify the correct copy option.

See *TPF Operations* for more information about the ZDPAT command.

**DPAT0013E PROGRAM IS UNALLOCATED — CANNOT PROCESS FILE COPY**

**Explanation:** Only the Copy-C parameter is valid for unallocated programs. Unallocated programs do not have an entry in the file copy of the program allocation table (PAT).

**System Action:** The ZDPAT command is rejected.

**User Response:** Enter the ZDPAT command again and specify the Copy-C parameter.

See *TPF Operations* for more information about the ZDPAT functional mesasge.

**DPAT0014A ZDPAT CANNOT BE PERFORMED WHILE ALLOCATOR CHANGE IS IN PROGRESS — ZDPAT ABORTED**

**Explanation:** A ZDPAT command cannot be entered while an `type` loader program allocation table (PAT) change request is in progress.

**System Action:** The ZDPAT command is rejected.

**User Response:** Enter the ZDPAT command again after the TPF system completes the PAT change request.

See *TPF Operations* for more information about the ZDPAT command.

**DPAT0101I BEGIN DISPLAY OF FILE COPY FOR IMAGE *name***

**Where:**

*name*
The image name.

**Explanation:** This is the normal response to the ZDPAT command. This message is followed by a display of the program allocation table (PAT) values for the requested program.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDPAT command and an example of the informational display.

**DPAT0102I BEGIN DISPLAY OF CORE COPY**

**Explanation:** This is the normal response to the ZDPAT command. This message is followed by a display of the program allocation table (PAT) values for the requested program.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDPAT command and for an example of the informational display.

**DPGM0010I BEGIN DISPLAY OF FILE COPY FOR *comp* VERSION *vv* IN IMAGE *name***

**Where:**

*comp*
The name of the CIMR component, IPL component, or CSECT.

*vv* The version code of the component.

**Note:** This will only be displayed for CIMR and IPL components, and CSECTs that have an associated version code.

*name*
The name of the image containing the CIMR component or CP CSECT. This is not shown for IPL components.

**Explanation:** This is the normal response to the ZDPGM command. This message is followed by a display of the specified number of lines of data.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDPGM command and for an example of the informational display.

**DPLT0002I DISPLAY ASSEMBLER PGMS LOADED OR ALLOCATED *xx* PGMS FOUND**

**Where:**

*xx* The number of programs found in the program allocation table (PAT) and extra PAT slots.

**Explanation:** This is the normal response to the ZDPLT command with the BAL parameter specified. This message is followed by a list of all the programs that match the input search criteria.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDPLT command and for an example of the informational display.

**DPLT0003I DISPLAY ISO-C DLLS LOADED *xx* DLLS FOUND**

**Where:**

*xx* The number of programs found in the program allocation table (PAT) and extra PAT slots.

**Explanation:** This is the normal response to the ZDPLT command with the DLL parameter specified. This message is followed by a list of all the programs that match the input search criteria.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDPLT command and for an example of the informational display.

**DPLT0004I DISPLAY ISO-C DLMS LOADED *xx* DLMS FOUND**

**Where:**

*xx* The number of programs found in the program allocation table (PAT) and extra PAT slots.

**Explanation:** This is the normal response to the ZDPLT command with the DLM parameter specified. This message is followed by a list of all the programs that match the input search criteria.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDPLT command and for an example of the informational display.

---

**DPLT0005I DISPLAY ISO-C LIBRARIES LOADED** *xx* **LIBS FOUND**

**Where:**

*xx* The number of programs found in the program allocation table (PAT) and extra PAT slots.

**Explanation:** This is the normal response to the ZDPLT command with the LIBRARY parameter specified. This message is followed by a list of all the programs that match the input search criteria.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDPLT command and for an example of the informational display.

---

**DPLT0006I DISPLAY PGM NAMES LOADED OR ALLOCATED** *xx* **PGMS FOUND**

**Where:**

*xx* The number of programs found in the program allocation table (PAT) and extra PAT slots.

**Explanation:** This is the normal response to the ZDPLT command with the NAME parameter specified. This message is followed by a list of all the programs that match the input search criteria.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDPLT command and for an example of the informational display.

---

**DPLT0007I DISPLAY TARGET(TPF) PROGRAMS LOADED** *xx* **PGMS FOUND**

**Where:**

*xx* The number of programs found in the program allocation table (PAT) and extra PAT slots.

**Explanation:** This is the normal response to the ZDPLT command with the TARGET parameter specified. This message is followed by a list of all the programs matching the input search criteria.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDPLT command and for an example of the informational display.

---

**DPLT0008I DISPLAY IPAT INFORMATION IPAT CREATION TIME** *day mmm dd hh:mm:ss yyyy*

**Where:**

*day* The day of the week when the program allocation table (PAT) was created.

*mmm*
The month when the PAT was created.

*dd* The day of the month when the PAT was created.

*hh:mm:ss*
The time of day when the PAT was created.

*yyyy*
The year when the PAT was created.

**Explanation:** This is the normal response to the ZDPLT command with the IPAT parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDPLT command.

---

**DPLT0009E ERROR IN NAME PARAMETER**

**Explanation:** The value of the NAME parameter cannot exceed four characters and can only be less than four characters when the last character is a wildcard (*).

**System Action:** None.

**User Response:** Enter the ZDPLT command again specifying a valid value for the NAME parameter.

See *TPF Operations* for more information about the ZDPLT command and for an example of the informational display.

---

**DRCT0001I APPL CPU SS SSU STATUS**

**Explanation:** This is the normal response to the ZDRCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDRCT command.

---

**DRCT0002E SUBSYSTEM USER** *uuuu* **HAS NO ENTRIES**

**Where:**

*uuuu*
The subsystem user (SSU) name (one to 4 characters).

**Explanation:** There are no entries in the routing control application table for the subsystem user (SSU) specified in the ZDRCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDRCT command.

---

**DRCT0003E CPU *c* HAS NO ENTRIES**

**Where:**

*c* The CPU ID (one character).

**Explanation:** There are no entries in the routing control application table for the CPU ID specified in the ZDRCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDRCT command.

**DRCT0004E APPL *aaaa* IS NOT CONTAINED IN RCAT**

**Where:**

*aaaa*
The application program name (one to four characters).

**Explanation:** The application program name specified in the ZDRCT command is not in the routing control application table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDRCT command.

**DRCT0005E SUBSYSTEM *ssss* HAS NO ENTRIES**

**Where:**

*ssss* The subsystem name (one to four characters).

**Explanation:** There are no entries in the routing control application table for the subsystem specified in the ZDRCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDRCT command.

**DRCT0006E SUBSYSTEM NOT ACTIVE**

**Explanation:** The subsystem specified in the ZDRCT command is not active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDRCT command.

**DRCT0007E RCAT HAS NO ENTRIES**

**Explanation:** One of the following errors occurred:

- The routing control application table was not loaded into the TPF system.
- The routing control application table has no entries.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDRCT command.

**DRCT0010I CORRECT FORMAT IS:**

**Explanation:** The TPF system issues this message when you enter the ZDRCT command with the incorrect format. This message header is followed by a display of the various formats for the ZDRCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDRCT command.

**DRD40067E ERROR RETRIEVING RIAT**

**Explanation:** An error occurred while retrieving the record ID attribute table (RIAT) record that contains the pool overrides.

**System Action:** Processing for the command is aborted and a system error (SERRC macro) is issued.

**User Response:** Do the following:

1. Examine the associated dump.
2. Take the appropriate actions.

See *TPF Operations* for more information about the ZRTDM commands.

**DRD40068E ERROR FILING RIAT**

**Explanation:** An error occurred while filing the record ID attribute table (RIAT) record that contains the pool overrides.

**System Action:** Processing for the command is aborted and a system error (SERRC macro) is issued.

**User Response:** Do the following:

1. Examine the associated dump.
2. Take the appropriate actions.

See *TPF Operations* for more information about the ZRTDM commands.

**DRD50050E UNABLE TO LOCATE RIAT RECORD ON DASD FOR ID *yyyy***

**Where:**

*yyyy*
The DASD ID.

**Explanation:** While reading the record ID attribute table (RIAT) from DASD into core, one record at a time, the last record in the chain of RIAT records was read into core but the desired record was not found. The error occurred in the DRD5 segment, which was activated by a ZRTDM command.

**System Action:** Processing for the command is ended and a system error (SERRC macro) is issued.

**User Response:** Do the following:

1. Examine the associated dump.

2. Take the appropriate actions.

See *TPF Operations* for more information about the ZRTDM commands.

---

**DRD50056E ERROR RETRIEVING RIAT DEFINITION RECORD FROM DASD**

**Explanation:** An error occurred during a FIWHC macro while trying to retrieve the record ID attribute table (RIAT) definition record from DASD. The error occurred in the DRD5 segment, which was activated by a ZRTDM command.

**System Action:** Processing for the command is ended and a system error (SERRC macro) is issued.

**User Response:** Do the following:

1. Examine the associated dump.
2. Take the appropriate actions.

See *TPF Operations* for more information about the ZRTDM commands.

---

**DRD50061E NO MORE SPACE IN RIAT DEFINITION RECORD – VFA DATA IGNORED FOR ID** *yyyy* **AND ALL SUBSEQUENT ENTRIES**

**Where:**

*yyyy*
The ID of for the virtual file access (VFA) data.

**Explanation:** There is no more room in the record ID attribute table (RIAT) definition record for any more candidate definitions.

**System Action:** If the ZRTDM command contains multiple IDs, as many entries as can still fit into the RIAT definition record are added to this record. The virtual file access (VFA) definitions for all other IDs specified in the command are ignored.

**User Response:** The number of candidates in the RIAT definition record must be reduced.

See *TPF Operations* for more information about the ZRTDM commands and how to reduce the size of the RIAT definition record.

---

**DRD50063E ERROR RETRIEVING RIAT ID** *recid*

**Where:**

*recid*
The record ID.

**Explanation:** An error occurred while retrieving the record ID attribute table (RIAT) record that contains the entry for the specified record ID.

**System Action:** Processing for the command is aborted and a system error (SERRC macro) is issued.

**User Response:** Do the following:

1. Examine the associated dump.
2. Take the appropriate actions.

See *TPF Operations* for more information about the ZRTDM commands.

---

**DRD50064E ERROR FILING RIAT ID** *recid*

**Where:**

*recid*
The record ID.

**Explanation:** An error occurred while filing the record ID attribute table (RIAT) record that contains the entry for the specified record ID.

**System Action:** Processing for the command is aborted and a system error (SERRC macro) is issued.

**User Response:** Do the following:

1. Examine the associated dump.
2. Take the appropriate actions.

See *TPF Operations* for more information about the ZRTDM commands.

---

**DREC0012I DISPLAY OF FILE ADDRESS** *fileaddr*

**Where:**

*fileaddr*
The 16-digit hexadecimal file address.

**Explanation:** This is the normal response to the ZDREC command. This message is followed by a display of the requested data.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDREC command and for an example of the informational display.

---

**DREC0020I UNIQUE COPIES OF THIS RECORD EXIST FOR OTHER I-STREAMS, PROCESSORS, OR SUBSYSTEM USERS**

**Explanation:** This is an informational message. The record being displayed is not shared by all other I-streams, processors, and subsystem users (SSUs).

**System Action:** The physical record is displayed for the current (default) I-stream, processor, and SSU where the command was entered. Other copies, with different physical records, may exist for other I-streams, processors, or SSUs.

**User Response:** Use the IS-x CPUID-y SSU-zzzz optional keywords to display the physical record for a specific I-stream, processor, or SSU.

See *TPF Operations* for more information about the ZDREC command.

---

**DSER0001I**

**Explanation:** This is the normal response to the ZDSER command. This message is followed by a formatted display of the system error options currently in effect.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSER command and an example of the informational display.

**DSER0002I**

**Explanation:** This message is followed by a formatted display of the system error options currently in effect.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSER command and an example of the informational display.

---

**DSER0042E INVALID PARAMETER — *parmx***

**Where:**

*parmx*
The parameter that is not valid.

**Explanation:** The parameter specified in the message is not a valid parameter for the ZDSER command.

**System Action:** ZDSER processing is ended.

**User Response:** Enter the ZDSER command again with a valid parameter.

See *TPF Operations* for more information about the ZDSER command.

---

**DSID0001I THE SYSTEM ID IS *enterprise.complex cpuid* ON PROCESSOR *num* MODEL *mod* LOW CPU ADDRESS *addr***

**Where:**

*enterprise*
The name of your enterprise or operations center.

*complex*
The name of your loosely coupled complex or stand-alone TPF processor.

*cpuid*
The TPF CPU identifier.

*num*
The two-character version code with the six-character CPU serial number.

*mod*
The CPU model number, for example, 3090.

*addr*
The lowest CPU address of the processor or processor partition on which the TPF system is running.

**Explanation:** This message is displayed with the system ID, which consists of the enterprise name, complex name, CPU ID and the CPU serial number, model number, and low CPU address. It is issued by CNAL as a response to the ZDSID command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSID command and the CNAL listing.

---

**DSID0050E SYSTEM ID DISPLAY FAILED DUE TO CTKI RETRIEVAL ERROR. INVESTIGATE CTL-0FB DUMP FROM CYYM.**

**Explanation:** A ZDSID command was entered to display the system ID information from keypoint I. However, the CYYM segment was unable to retrieve the keypoint and issued a CTL-0FB dump.

**System Action:** The CNAL program (ZDSID message processor) is exited.

**User Response:** Have your system programmer examine the CTL-0FB dump determine the cause of the error.

See *TPF Operations* for more information about the ZDSID command and the CNAL listing.

---

**DSMG0001I DDNAME *ddname* DEFINED**

**Where:**

*ddname*
The data definition name.

**Explanation:** The data definition name was defined successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG DEFINE command.

---

**DSMG0002I DDNAME *ddname* VOLUME *num addr* MOUNTED**

**Where:**

*ddname*
A one to sixteen character data definition name.

*num*
The volume sequence number.

*addr*
The device address.

**Explanation:** The ZDSMG MT command is processed successfully for the data definition name, volume number, and device address specified in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT command.

---

**DSMG0005I** *dsname*

**Where:**

*dsname*
A one to 44 character data set name.

**Explanation:** This is the normal response to the ZDSMG VTOC command with the DISPLAY parameter specified. This message displays the data set name of the specified data set. It is displayed with the DSMG0001I and DSMG0007I messages.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG VTOC command.

---

**DSMG0006I VOLUME NUMBER *vol* NUMBER EXTENTS *ext***

**Where:**

*vol* A one to 64 digit volume sequence number.

*ext* A one to sixteen digit number of extents on volume.

**Explanation:** This informational message is issued as part of a ZDSMG VTOC command request. It displays the volume number and the number of extents on the specified volume for the subject data set.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG VTOC command.

---

**DSMG0007I VTOC SCAN COMPLETE**

**Explanation:** The requested scan and display of the volume table of contents (VTOC) is complete.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG VTOC command.

---

**DSMG0008I DDNAME *ddname* VOLUME *num* DISMOUNTED DSNAME *dsname***

**Where:**

*ddname*
A one to sixteen character data definition name.

*num*
The volume sequence number.

*dsname*
The data set name.

**Explanation:** The ZDSMG DM command is processed successfully for the data definition name, volume number, and data set name specified in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG DM command.

---

**DSMG0009I DDNAME *ddname* DISMOUNTED DSNAME *dsname***

**Where:**

*ddname*
A one to sixteen character data definition name.

*dsname*
The data set name.

**Explanation:** The ZDSMG DM command is processed successfully for all volumes of the data definition name and data set name specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG DM command.

---

**DSMG0010I DISPLAY COMPLETE**

**Explanation:** The requested data set display is complete.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG DISPLAY command.

---

**DSMG0012I MOUNT NOT RECORDED DUE TO SCHEDULED INITIALIZATION**

**Explanation:** The information about the mounted data set is not recorded to file for restart because the restart control record is scheduled to be reinitialized on the next IPL.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT command.

---

**DSMG0013I SCHEDULED GDS INITIALIZATION COMPLETED**

**Explanation:** The requested reinitialization is complete.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG command.

---

**DSMG0024E DEVICE ADDRESS *addr* NOT USABLE**

**Where:**

*addr*
A symbolic device address.

**Explanation:** The device address specified in the message is not usable for a general data set (GDS) because:

- It is already in use for general files or the online database
- Input/output (I/O) errors are received during an attempt to initialize the device.

**System Action:** The volume is not mounted.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG command.

---

### DSMG0026E NO GDS MODULE ENTRIES AVAILABLE

**Explanation:** No unused general data set (GDS) module entries are available for the requested mount.

**System Action:** The volume is not mounted.

**User Response:** Enter the ZDMFS command to determine whether the GDS modules are in use or whether a TPF system problem is leaving modules mounted after they are dismounted.

See *TPF Operations* for more information about the ZDSMG MT and ZDSMG VTOC commands.

### DSMG0028E I/O ERROR READING VTOC ON *addr*

**Where:**

*addr*
The symbolic device address (SDA).

**Explanation:** The TPF system found an input/output (I/O) error while trying to read the volume table of contents (VTOC) on the device specified in the message.

**System Action:** The volume is not mounted.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT and ZDSMG VTOC commands.

### DSMG0029E DATA SET NAME NOT FOUND IN VTOC ON *addr*

**Where:**

*addr*
The symbolic device address.

**Explanation:** The data set name is not found in the volume table of contents (VTOC) on the device specified in the message.

**System Action:** The volume is not mounted.

**User Response:** Enter a ZDSMG VTOC command to display all data sets in the VTOC.

If the data set name is there, then a TPF system problem exists. Otherwise, the correct device address should be determined and used.

See *TPF Operations* for more information about the ZDSMG MT and ZDSMG VTOC commands.

### DSMG0030E VOLUME NUMBER OTHER THAN 1 IS INVALID WITH ALL

**Explanation:** The ZDSMG DM command included the ALL keyword and a volume number other than 1. The keyword ALL is allowed only when no volume number or a volume number of 1 is specified.

**System Action:** The request is ignored.

**User Response:** Enter the command again with the correct options.

See *TPF Operations* for more information about the ZDSMG DM command.

### DSMG0031E VOLUME NUMBER REQUIRED IF ALL NOT SPECIFIED

**Explanation:** A ZDSMG DM command that does not specify a volume number does not default to ALL. A dismount request must specify what is to be dismounted.

**System Action:** The request is ignored.

**User Response:** Enter the command again with the correct options.

See *TPF Operations* for more information about the ZDSMG DM command.

### DSMG0032E ALL WITH EITHER DDNAME OR DSNAME IS INVALID

**Explanation:** A ZDSMG DISPLAY command can be used to display either an explicit data definition name (DDNAME) or data set name (DSNAME), or all DDNAMES and DSNAMES, but not both.

**System Action:** The request is ignored.

**User Response:** Enter the command again with the correct options.

See *TPF Operations* for more information about the ZDSMG DISPLAY command.

### DSMG0033E DDNAME, DSNAME OR ALL MUST BE SPECIFIED

**Explanation:** A ZDSMG DISPLAY command must include at least the keyword ALL or a specific DDNAME or data set name.

**System Action:** The request is ignored.

**User Response:** Enter the command again with the correct options.

See *TPF Operations* for more information about the ZDSMG DISPLAY command.

### DSMG0034E FACE/FIND ERROR ON GDS CONTROL RECORD

**Explanation:** An error occurred while trying to access the general data set (GDS) restart control record.

**System Action:** The data set/volume is mounted or dismounted, as specified by the ZDSMG command. However, the status of the data set is not updated in the GDS restart records.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT and ZDSMG DM commands.

### DSMG0035E ERROR ON FILE OF GDS CONTROL RECORD

**Explanation:** An error occurred while trying to write the general data set (GDS) restart control record.

**System Action:** The data set/volume is mounted or dismounted, as specified by the ZDSMG command. However,

the status of the data set is not updated in the GDS restart records.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT and ZDSMG DM commands.

---

**DSMG0036I GDS INITIALIZATION SCHEDULED FOR NEXT IPL**

**Explanation:** This is the normal response to the ZDSMG INIT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG INIT command.

---

**DSMG0037E INVALID TAPE NAME**

**Explanation:** The tape name specified for the ZDSMG DEFINE command is not valid because it does not contain 3 characters.

**System Action:** The ZDSMG DEFINE command is ignored.

**User Response:** Enter the ZDSMG DEFINE command again and specify a 3-character tape name.

See *TPF Operations* for more information about the ZDSMG DEFINE command.

---

**DSMG0038E INVALID VOLUME NUMBER — ZERO**

**Explanation:** A volume number of zero is specified on a ZDSMG MT or ZDSMG DM command. However, no volume 0 exists.

**System Action:** The request is ignored.

**User Response:** Enter the command again with the correct options.

See *TPF Operations* for more information about the ZDSMG MT and ZDSMG DM commands.

---

**DSMG0039E INVALID SPOOL ID VALUE**

**Explanation:** The specified spool ID is not valid.

**System Action:** The ZDSMG DEFINE command is ignored.

**User Response:** Enter the command again and specify a valid spool ID.

See *TPF Operations* for more information about the ZDSMG DEFINE command.

---

**DSMG0040E INVALID DEFINE REQUEST, TYPE NOT SPECIFIED**

**Explanation:** You must specify the type of medium where the data set resides when you enter the ZDSMG DEFINE command.

**System Action:** The ZDSMG DEFINE command is ignored.

**User Response:** Enter the ZDSMG DEFINE command again and specify the medium where the data set resides.

See *TPF Operations* for more information about the ZDSMG DEFINE command.

---

**DSMG0041E INVALID DEFINE REQUEST, MORE THAN ONE TYPE**

**Explanation:** You can specify only one data set medium for the ZDSMG DEFINE command.

**System Action:** The ZDSMG DEFINE command is ignored.

**User Response:** Enter the ZDSMG DEFINE command again and specify only one medium for the data set.

See *TPF Operations* for more information about the ZDSMG DEFINE command.

---

**DSMG0042E INVALID GFDS VALUE. MUST BE 0 TO 59**

**Explanation:** The general file data set number specified for the ZDSMG DEFINE command is not valid. The number must be between 0 and 59.

**System Action:** None.

**User Response:** Enter the ZDSMG DEFINE command again and specify a general file data set number between 0 and 59.

See *TPF Operations* for more information about the ZDSMG DEFINE command.

---

**DSMG0043E INVALID USER VALUE, LENGTH EXCEEDS MAXIMUM**

**Explanation:** The length of the value specified for the USER parameter exceeds the maximum allowed. The parameter must be between 1 and 44 characters.

**System Action:** The ZDSMG DEFINE command is ignored.

**User Response:** Enter the ZDSMG DEFINE command again and specify a USER parameter with length of 1 to 44 characters.

See *TPF Operations* for more information about the ZDSMG DEFINE command.

**Note:** Because delimiting quotes will be removed from the USER parameter value prior to storing it in the control block, programs referencing the control block should not expect to use the terminating quote to locate the end of the value passed.

---

**DSMG0044E DATA SET HAS MORE THAN 16 EXTENTS**

**Explanation:** The format 1 DSCB for the specified data set states that the data set contains more than 16 extents on this volume. The TPF and IBM MVS only support a maximum of 16 extents. Therefore, the DSCB is not valid and the TPF system will not mount the volume.

**System Action:** The mount request for the volume is ignored. If this is the first mount for the data set, then the data set is also not mounted.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT command.

### DSMG0045E VOLUME ALREADY MOUNTED

**Explanation:** A mount request is entered for a volume already mounted.

**System Action:** The request is ignored.

**User Response:** Enter the ZDSMG DISPLAY command to display the data definition names that were already defined and to determine how these names are being used.

See *TPF Operations* for more information about the ZDSMG DISPLAY command.

### DSMG0046E VOLUME NUMBER DOES NOT MATCH DSCB

**Explanation:** The volume number specified on the mount request does not match the volume number in the data set control block for the data set on the specified device.

**System Action:** The request is ignored and the device is dismounted if it was mounted for this request.

**User Response:** Enter a ZDSMG VTOC command to determine the volume number specified in the data set control block for the volume.

See *TPF Operations* for more information about the ZDSMG MT command.

### DSMG0047E INVALID FORMAT 3 DSCB FOR DATA SET

**Explanation:** The specified data set contains more than three extents on this volume. However, the format 3 DSCB that contains the extent descriptions has a key that is not valid.

**System Action:** The request is ignored and the device is dismounted if it was mounted for this request.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT command.

### DSMG0048E DATA SET HAS NO EXTENTS

**Explanation:** The data set control block (DSCB) for the specified data set is found on the given device but the DSCB extent information is 0.

**System Action:** The request is ignored and the device is dismounted if it was mounted for this request.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT command.

### DSMG0049E I/O ERROR READING FORMAT 3 DSCB

**Explanation:** An error occurred while trying to access the format 3 data set control block (DSCB) for the data set.

**System Action:** The request is ignored and the device is dismounted if it was mounted for this request.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT command.

### DSMG0050E DDNAME NOT KNOWN TO SYSTEM

**Explanation:** The data definition name specified for the ZDSMG DM command is not in use. Therefore, it cannot be dismounted.

**System Action:** The request is ignored.

**User Response:** Enter the ZDSMG DM command again and specify a valid data definition name.

See *TPF Operations* for more information about the ZDSMG DM command.

### DSMG0051E DDNAME/DSNAME MISMATCH

**Explanation:** The data definition name (DDNAME) or data set name (DSNAME) is already in use with a corresponding name other than the one specified.

**System Action:** The request is ignored.

**User Response:** Enter the ZDSMG DISPLAY command to display the data definition names that were already defined and to determine how these names are being used.

See *TPF Operations* for more information about the ZDSMG MT and ZDSMG DM commands.

### DSMG0052E DSNAME ALREADY IN USE

**Explanation:** The specified data set name (DSNAME) is already mounted with a data definition name (DDNAME) other than the one provided.

**System Action:** The request is ignored.

**User Response:** Enter the ZDSMG DISPLAY command to display the data definition names that were already defined and to determine how these names are being used.

See *TPF Operations* for more information about the ZDSMG MT command.

### DSMG0053E ERROR ADDING DATA SET TO SYSTEM

**Explanation:** The control program found an error condition that prevented it from adding the new data set to the general data set (GDS) structure.

**System Action:** The data set is not mounted.

**User Response:** The most common reason for this message is that the control program is unable to locate a system work block (SWB). Make sure that enough SWBs are allocated to hold the number of data sets and volumes to be mounted.

See *TPF Operations* for more information about the ZDSMG MT command.

### DSMG0054E ERROR ADDING VOLUME TO SYSTEM

**Explanation:** The control program found an error condition that prevented it from adding the new volume to the general data set (GDS) structure.

**System Action:** The volume is not mounted.

**User Response:** The most common reason for this return is that the control program is unable to allocate a system work block (SWB). Make sure that enough SWBs are allocated to

hold the number of data sets and volumes to be mounted.

See *TPF Operations* for more information about the ZDSMG MT command.

### DSMG0055E VOLUME NOT MOUNTED FOR SPECIFIED DATA SET

**Explanation:** The specified volume is not mounted for the given data set.

**System Action:** The request is ignored.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG DM command.

### DSMG0056E ERROR DELETING VOLUME FROM SYSTEM

**Explanation:** The control program found an error condition while deleting a volume for the data set from the general data set (GDS) structure.

**System Action:** Processing of the request is stopped.

**User Response:** Enter the ZDSMG DISPLAY command to determine whether the data set volume is known to the TPF system. If it is, enter the ZDSMG DM command again. If the function fails again, perform a ZDUMP for the TPF system and include the system work block (SWB) core blocks.

See *TPF Operations* for more information about the ZDSMG DM command.

### DSMG0057E ERROR DELETING DATA SET FROM SYSTEM

**Explanation:** The control program found an error condition while deleting the data set from the general data set (GDS) structure.

**System Action:** Processing of the request is stopped.

**User Response:** Enter the ZDSMG DISPLAY command to determine whether the data definition name is known to the TPF system. If it is, enter the ZDSMG DM command again. If the function fails again, perform a ZDUMP for the TPF system and include the system work block (SWB) core blocks.

See *TPF Operations* for more information about the ZDSMG DM command.

### DSMG0058E DDNAME ALREADY IN USE

**Explanation:** The data definition name specified for the ZDSMG DEFINE or ZDSMG MT command is already in use.

**System Action:** The ZDSMG DEFINE or ZDSMG MT command is rejected.

**User Response:** Do the following:

1. Enter the ZDSMG DISPLAY command to display the data definition names that were already defined and to determine how these names are being used.
2. Enter the ZDSMG DEFINE command again and specify a unique data definition name.

See *TPF Operations* for more information about the ZDSMG DEFINE, ZDSMG MT, and ZDSMG DISPLAY commands.

### DSMG0059E DISMOUNT ALLOWED FOR GENERAL DATA SETS ONLY

**Explanation:** You can use the ZDSMG DM command only to dismount general data sets (GDSs). The data definition name specified for the ZDSMG DM command was not assigned to a GDS.

**System Action:** The ZDSMG DM command is ignored.

**User Response:** Enter the ZDSMG RELEASE command to delete the data definition name from the TPF system.

See *TPF Operations* for more information about the ZDSMG DM and ZDSMG RELEASE commands.

### DSMG0060E DDNAME NOT KNOWN TO SYSTEM

**Explanation:** The specified data definition name (DDNAME) is not known to the TPF system.

**System Action:** The display request is ignored.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG DISPLAY command.

### DSMG0062E DSNAME NOT KNOWN TO SYSTEM

**Explanation:** The specified data set name is not known to the TPF system.

**System Action:** The display request is ignored.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG DISPLAY command.

### DSMG0063E DSNAME INVALID FOR NON-GDS DEFINITION

**Explanation:** The specified data set name is not defined as a general data set (GDS). If you specify the DSName parameter, you must specify the name of a GDS.

**System Action:** The ZDSMG DISPLAY command is ignored.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG DISPLAY command.

### DSMG0067E INVALID VOLUME. VOLUME HAS NO VTOC

**Explanation:** The specified device has a volume table of contents (VTOC) address of zero.

**System Action:** The device is dismounted.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG VTOC command.

**DSMG0068E I/O ERROR READING FORMAT 4 DSCB FOR VTOC**

**Explanation:** An error is found during an attempt to read the volume table of contents (VTOC) descriptor data set control block (DSCB).

**System Action:** The device is dismounted.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG VTOC command.

---

**DSMG0070E FACE ERROR ON GDS RECORD** *num*

**Where:**

*num*
The ordinal number of the record.

**Explanation:** A file address compute (FACE) program error was found while trying to access the specified general data set (GDS) restart record.

**System Action:** The data set/volume is mounted or dismounted, as specified by the ZDSMG command. However, the status of the data set is not updated in the GDS restart records.

**User Response:** Determine whether enough records are allocated to the #DSCRU record type to hold the number of data sets mounted concurrently on this processor. If not, allocate more records. If there are enough records, dump the records and determine why more are needed.

See *TPF Operations* for more information about the ZDSMG commands.

---

**DSMG0071E FIND ERROR ON GDS RECORD** *num*

**Where:**

*num*
The ordinal number of the record.

**Explanation:** An error was found while trying to access the specified general data set (GDS) restart record.

**System Action:** The data set/volume is mounted or dismounted, as specified by the ZDSMG command. However, the status of the data set is not updated in the GDS restart records.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT command.

---

**DSMG0072E GDS RECORDS FULL. MOUNT NOT RECORDED**

**Explanation:** While trying to record the data set mount request, no free entries were found in the general data set (GDS) restart records.

**System Action:** The mount completes, but it is not remounted on the next IPL.

**User Response:** Determine whether enough records are allocated to the #DSCRU record type to hold the number of data sets mounted and defined concurrently. If not, allocate more records. If there are enough records, dump the records and determine why more are needed.

See *TPF Operations* for more information about the ZDSMG MT command.

---

**DSMG0073E GDS LOGIC ERROR. UNABLE TO LOCATE DSCB**

**Explanation:** The TPF system is unable to locate the control block for the data set in the general data set (GDS) control structure.

**System Action:** The mount request is not recorded in the GDS restart data set.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT command.

---

**DSMG0074E MISMATCH BETWEEN GDS CONTROL AND DATA RECORDS**

**Explanation:** The control record for the general data set (GDS) restart records stated that this record has an available entry, but none is found.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT command.

---

**DSMG0075E FILE ERROR ON GDS RECORD** *num*

**Where:**

*num*
The ordinal number of the record.

**Explanation:** An error was found while trying to write the specified general data set (GDS) restart record.

**System Action:** The data set/volume is mounted or dismounted, as specified by the ZDSMG command. However, the status of the data set is not updated in the GDS restart records.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT and ZDSMG DM commands.

---

**DSMG0076E GDS LOGIC ERROR. UNABLE TO LOCATE DATA SET ENTRY IN RECORD**

**Explanation:** The control block for the data set stated that the restart entry for the data set was in the record just searched, but it cannot be located.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT and ZDSMG DM commands.

---

**DSMG0077E GDS LOGIC ERROR. UNABLE TO LOCATE EMPTY VOLUME SLOT IN RECORD**

**Explanation:** The entry for the data set in the restart record stated that volume entries are available. However, none were found.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT command.

**DSMG0078E GDS LOGIC ERROR. UNABLE TO LOCATE VOLUME ENTRY IN RECORD**

**Explanation:** During dismount, the control program was unable to locate the volume entry in the restart record for the volume being dismounted.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG DM command.

**DSMG0079E GDS ALLOCATION ERROR. AVAILABLE COUNT INVALID**

**Explanation:** The count of available entries in a record went negative minus while trying to record a mount request.

**System Action:** The count is set to 0 and the mount request is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG MT command.

**DSMG0080E FACE ERROR ON GDS RECORD** *num*

**Where:**

*num*
A 1 – 4 digit decimal number. If this TPF system is loosely coupled, the #DSCRU records are for this processor.

**Explanation:** A file address compute (FACE) program error is returned while trying to access the displayed ordinal number as part of a general data set (GDS) restart.

**System Action:** The message is displayed and GDS restart is continued with the next record that exists.

**User Response:** Determine why the ordinal number is not valid for the #DSCRU record type for this processor.

**DSMG0081E FIND ERROR ON GDS RECORD** *num*

**Where:**

*num*
A 1 – 4 digit decimal number. If this TPF system is loosely coupled, the #DSCRU records are for this processor.

**Explanation:** A FIND error was received while trying to access the displayed ordinal number as part of the general data set (GDS) restart.

**System Action:** The message is displayed and GDS restart is continued with the next record if one exists.

**User Response:** Determine why the record is unable to be accessed by entering the ZDADD command.

See *TPF Operations* for more information about the ZDADD command.

**DSMG0082E DDNAME** *ddname* **VSN** *vsn* **NOT FOUND. VOLUME NOT MOUNTED**

**Where:**

*ddname*
A one to sixteen character data definition name.

*vsn* The volume serial number of the missing pack.

**Explanation:** The pack with the volume serial number (VSN) specified in the message is required to mount the data set with the data definition name specified in the message is not found, so the data set is not mounted.

**System Action:** The data set is not mounted.

**User Response:** Determine why the volume is not found. If it can be made available, mount the data set volume by entering the appropriate ZDSMG command.

**DSMG0083E DDNAME** *ddname* **NO VOLUMES FOUND. DATA SET NOT MOUNTED**

**Where:**

*ddname*
A 1 to 16 character data definition name.

**Explanation:** No volumes are found for the data definition name specified in the message.

**System Action:** The data set is not mounted.

**User Response:** Determine why the missing volumes are not found by the IPL.

**DSMG0086E GDS PRE-MOUNT ABORTED**

**Explanation:** The general data set (GDS) reinitialization is ended because of errors while processing the pre-mount records.

**System Action:** The request is ended.

**User Response:** Using previously displayed error messages, determine why the pre-mount process failed.

**DSMG0087E FIND ERROR ON PRE-MOUNT RECORD**

**Explanation:** An error was received while trying to access one of the pre-mount data records.

**System Action:** Pre-mount processing is ended.

**User Response:** Enter the ZDPGM command to access the pre-mount records and to determine why the pre-mount process is unable to access them.

See *TPF Operations* for more information about the ZDPGM command.

### DSMG0088E INCOMPLETE ENTRY IN PRE-MOUNT RECORD

**Explanation:** While processing a pre-mount record, the general data set (GDS) control program reached the end of the record before completing processing of the pre-mount entry.

**System Action:** Processing is stopped for this record. The next record, if one exists, is retrieved.

**User Response:** Enter the ZDPGM command to access the pre-mount record and to determine what is wrong with the record.

See *TPF Operations* for more information about the ZDPGM command.

### DSMG0090E FACE ERROR ON GDS RECORD 0

**Explanation:** A file address compute (FACE) program error was found while trying to access the general data set (GDS) restart control record.

**System Action:** No GDSs are remounted. GDS restart is ended.

**User Response:** Determine why the FACE program is unable to generate a file address for the required ordinal number of the #DSCRU record type.

### DSMG0091E FIND ERROR ON GDS RECORD 0

**Explanation:** An error was found while trying to access the general data set (GDS) restart control record.

**System Action:** No GDSs are remounted. The GDS restart is ended.

**User Response:** Enter the ZDSMG INIT command, which causes the GDS record to be initialized again on the next IPL from the pre-mount records. Otherwise, the record must be displayed and corrected by entering the ZAFIL or ZDFIL commands.

See *TPF Operations* for more information about the ZDSMG INIT, ZAFIL, and ZDFIL commands.

### DSMG0092E ERROR ATTEMPTING TO FILE GDS RECORD 0

**Explanation:** An error is found while trying to write the general data set (GDS) restart control record.

**System Action:** The GDS pre-mount is ended.

**User Response:** Using the messages from CCSONS, determine why the TPF system is unable to write the record.

### DSMG0093E GDS RESTART ABORTED

**Explanation:** Due to errors that occurred while trying to process the general data set (GDS) restart records, restart processing is ended. Some data sets may have been mounted.

**System Action:** The GDS restart request is ended.

**User Response:** Recovery is determined from the previous error messages that describe why GDS restart was ended.

### DSMG0095E UNABLE TO MIGRATE GDS

**Explanation:** While attempting to migrate the general data set (GDS) control records from #DSCRI to #DSCRU fixed record types, a record ID (RID) or record control check (RCC) error occurred when accessing the GDS restart control record. The error occurred for one of the following reasons:

- The #DSCRI and #DSCRU record sizes do not match.
- There are not enough #DSCRU ordinals defined to copy the entire structure.
- An error occurred while filing the new data records.

**System Action:** GDS restart ends.

**User Response:** Enter the ZDSMG INIT command to initialize the new record type again.

See *TPF Operations* for more information about the ZDSMG INIT command.

### DSMG0096I GDS MIGRATION COMPLETE

**Explanation:** Because a record ID (RID) or record control check (RCC) error occurred when accessing the general data set (GDS) restart control record, the GDS restart control records were migrated from the existing #DSCRI fixed file records to the new #DSCRU fixed file records.

**System Action:** GDS restart continues.

**User Response:** None.

### DSMG0099E ERROR READING MIGRATED GDS CONTROL RECORD

**Explanation:** The second FIND error has been received for the control record (record 0) of the #DSCRU record type. The first FIND error indicated that the records have not been initialized and caused migration processing to begin copying the #DSCRI records to the #DSCRU record type. Processing was restarted from the beginning of the restart segment and a second error occurred while reading record 0 of the #DSCRU record type.

**System Action:** General data set (GDS) restart is ended.

**User Response:** Do the following:

1. Enter the ZDSMG INIT command to reinitialize the #DSCRU record type.
2. Enter the ZMIGR command again.

See *TPF Operations* for more information about the ZDSMG INIT and ZMIGR commands.

### DSMG0100I DDNAME *ddname*

**Where:**

*ddname*
The data definition name.

**Explanation:** This message precedes ZDSMG error and informational messages. It identifies the data definition to which the error or informational message pertains.

**System Action:** None.

**User Response:** None.

**DSMG0104I DDNAME *ddname* RELEASED**

**Where:**

*ddname*
The data definition name.

**Explanation:** The specified data definition name was successfully removed from the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG RELEASE command.

**DSMG0108I START OF ZDSMG DISPLAY OUTPUT**

**Explanation:** This is the normal response to the ZDSMG DISPLAY command. This message is followed by a display of the mounted data sets.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG DISPLAY command and for an example of the informational display.

**DSMG0111I NO DATA SETS DEFINED**

**Explanation:** No general data sets (GDSs) were mounted or defined. Therefore, no information can be displayed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSMG DISPLAY command.

**DSMG0112I DEFINE NOT RECORDED DUE TO SCHEDULED INITIALIZATION**

**Explanation:** The data definition name was not saved to file for the restart routine because the restart control record is scheduled to be initialized again the next time an initial program load (IPL) is performed.

**System Action:** None.

**User Response:** If the data definition name should be recorded, enter the ZDSMG DEFINE command after the next IPL is performed.

See *TPF Operations* for more information about the ZDSMG DEFINE command.

**DSMG0153E ERROR ADDING DDNAME TO SYSTEM**

**Explanation:** An error occurred while trying to add a data definition name to the general data set (GDS) structure.

**System Action:** The define request is ended.

**User Response:** Ensure enough system work blocks (SWBs) were allocated to hold the number of data sets and volumes to be mounted or defined.

See *TPF Operations* for more information about the ZDSMG DEFINE command.

**DSMG0157E ERROR DELETING DDNAME FROM SYSTEM**

**Explanation:** An error occurred while trying to delete a data definition name from the general data set (GDS) structure.

**System Action:** The release request is ended.

**User Response:** Do the following:

1. Enter the ZDSMG RELEASE command again.
2. Enter the ZDUMP command if the request fails. Include the core system work blocks (SWBs).

See *TPF Operations* for more information about the ZDSMG RELEASE command.

**DSMG0172E GDS RECORDS FULL. DEFINE NOT RECORDED**

**Explanation:** An attempt was made to define a general data set (GDS) but no available entries were found in the GDS restart records.

**System Action:** The define request completes but the GDS is not defined again during the next initial program load (IPL).

**User Response:** Determine whether enough #DSCRI record types were allocated to hold the number of data sets mounted or defined for this processor. If not, more records need to be allocated. If enough records were allocated, dump the records and determine why more are needed.

See *TPF Operations* for more information about the ZDSMG DEFINE command.

# DSVC–DVSN

**DSVC0001I *xxxxxx* PRIMARY HEX *yy***

**Where:**

*xxxxxx*
The name of the SVC macro.

*yy* The hexadecimal SVC code.

**Explanation:** This is a normal response to the ZDSVC command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSVC command.

**DSVC0002E SVC NOT FOUND- *xxxxxx***

**Where:**

*xxxxxx*
The parameter specified for the ZDSVC command.

**Explanation:** The parameter specified for the ZDSVC is not correct.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format of the ZDSVC command.

2. Enter the ZDSVC command again using the correct format.

See *TPF Operations* for more information about the ZDSVC command.

---

**DSVC0004I** *xxxxxx* **PRIMARY HEX** *yy* **INDEX HEX** *zzzz*

**Where:**

*xxxxxx*
The name of the SVC macro.

*yy* The primary hexadecimal SVC code.

*zzzz*
The hexadecimal index into the secondary SVC table.

**Explanation:** This is the normal response to the ZDSVC command.

**System Action:** None.

**User Response:** None

See *TPF Operations* for more information about the ZDSVC command.

---

**DSYS0001I THE SYSTEM IS IN** *xxxx* **STATE**

**Where:**

*xxxx*
The TPF system state (1052, UTIL, CRAS, MESW, NORM).

**Explanation:** This is the normal response to the ZDSYS command. The state of the TPF system may be one of the following:
- 1052 – 1052 state
- UTIL – Utility state
- CRAS – CRAS state
- MESW – Message switching state
- NORM – Normal state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSYS command.

---

**DSYS0002I THE SYSTEM IS IN RESTART**

**Explanation:** This is the normal response to the ZDSYS command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSYS command.

---

**DSYS0003E INVALID SYSTEM STATE INDICATOR, SUGGEST INVESTIGATE**

**Explanation:** The TPF system state indicator is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSYS command.

---

**DSYS0004I CYCLE FROM** *xxxx* **to** *xxxx* **STATE IN PROGRESS**

**Where:**

*xxxx*
The TPF system state (1052, UTIL, CRAS, MESW, NORM).

**Explanation:** This is the normal response to the ZDSYS command. The state of the TPF system may be one of the following:
- 1052 – 1052 state
- UTIL – Utility state
- CRAS – CRAS state
- MESW – Message switching state
- NORM – Normal state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSYS command.

---

**DSYS0005I STATE CHANGE DISABLED**

**Explanation:** This display is followed by the DSYS0001I message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDSYS command.

---

**DTCP0001I PINGED HOST** *yyyyyyyy* **RESPONSE TOOK** *xxx* **MSECS**

**Where:**

*yyyyyyyy*
The name of the host.

*xxx* The elapsed time in milliseconds.

**Explanation:** An echo message was sent to the Internet Protocol (IP) host and a response was received a number of milliseconds later. This message was in response to the ZDTCP command with the PING parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTCP command.

---

**DTCP0003I TPF TCP/IP NETSTAT**

**Explanation:** This message displays TPF system Transmission Control Protocol/Internet Protocol (TCP/IP) resource usage and activities. This message was in response to the ZDTCP command with the NETSTAT parameter specified.

**System Action:** None.

**User Response:** None

See *TPF Operations* for more information about the ZDTCP command and for an example of the informational display.

---

**DTCP0004I ROUTE TO *yyyyyyyy* AS FOLLOWS *n* *hostname* (*ip_address*) *xx* ms *xx* ms *xx* ms**

**Where:**

*yyyyyyyy*
The destination Internet Protocol (IP) host.

*n* The time-to-live (TTL) number.

*hostname*
The symbolic form of the name of a router or host in the path of the destination host, or the dotted decimal IP address of the router or host.

*ip_address*
The dotted decimal form of the name of a router or host in the path of the destination host.

*xx* An integral number of milliseconds comprising the elapsed time.

**Explanation:** This message displays the paths that are located between the current TPF host and the destination host. This message was in response to the ZDTCP command with the TRACERTE parameter specified.

**System Action:** None.

**User Response:** None

See *TPF Operations* for more information about the ZDTCP command.

---

**DTCP0005I TPF DNS SERVER *yyyyyyy* ADDED TO DNS TABLE**

**Where:**

*yyyyyy*
The Domain Name System (DNS) server Internet Protocol (IP) address.

**Explanation:** This message shows that a DNS server was added to the TPF DNS address table. This message was in response to the ZDTCP command with the DNS parameter specified.

**System Action:** None.

**User Response:** None

See *TPF Operations* for more information about the ZDTCP command.

---

**DTCP0006I TPF DNS SERVER PRIMARY-*yyyyyyyy* SECONDARY-*yyyyyyyy***

**Where:**

*yyyyyyyy*
Domain Name System (DNS) server Internet Protocol (IP) address.

**Explanation:** This message displays the TPF DNS address table. This message was in response to the ZDTCP command with the DNS parameter specified.

**System Action:** None.

**User Response:** None

See *TPF Operations* for more information about the ZDTCP command.

---

**DTCP0007I NAME SERVER RESOLUTION DISPLAY**

**Explanation:** This is the normal response to the ZDTCP command with the NSLOOKUP parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTCP command.

---

**DTCP0009I PING STARTED**

**Explanation:** This message is displayed when the TPF system begins pinging another host. This message was in response to the ZDTCP command with the PING parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTCP command.

---

**DTCP0010E UNKNOWN HOST *yyyyyyy***

**Where:**

*yyyyyy*
The Internet Protocol (IP) address or host name entered.

**Explanation:** The ZDTCP command was entered, but an incorrect IP address or host name was specified with the NSLOOKUP, PING or TRACERTE parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZDTCP command again with a valid IP address or host name.

See *TPF Operations* for more information about the ZDTCP command.

---

**DTCP0011E DNS SERVER INFORMATION IS NOT AVAILABLE**

**Explanation:** This message is displayed when the table containing the Domain Name System (DNS) server primary and secondary addresses cannot be located. This message was in response to the ZDTCP command with the DNS parameter specified.

**System Action:** None.

**User Response:** Do the following:

1. Determine why the TPF DNS address table cannot be found.
2. Correct the problem.
3. Enter the ZDTCP command again with the DNS parameter specified.

See *TPF Operations* for more information about the ZDTCP command.

### DTCP0013I NO DNS SERVER INFORMATION AVAILABLE TO DISPLAY

**Explanation:** This message is displayed when no Domain Name System (DNS) server primary or secondary addresses have been defined. This message was in response to the ZDTCP command with the DNS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTCP command.

### DTCP0020E SYSTEM MUST BE IN CRAS STATE OR ABOVE

**Explanation:** The ZDTCP command was entered, but the TPF system is not in CRAS state or higher.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Cycle the TPF system to CRAS state or higher.
2. Enter the ZDTCP command again.

See *TPF Operations* for more information about the ZDTCP command.

### DTCP0022E INCORRECT VALUE FOR TIMEOUT *timeout*

**Where:**

*timeout*
The user-defined timeout value.

**Explanation:** The ZDTCP command with the PING parameter specified was entered with an incorrect value for the Timeout option.

**System Action:** The ZDTCP command was rejected.

**User Response:** Enter the ZDTCP command again specifying a valid Timeout value or using the default value provided by the TPF system.

See *TPF Operations* for more information about the ZDTCP command.

### DTCP0023E ERROR OPENING SOCKET

**Explanation:** An error occurred when trying to open a socket for the ZDTCP command with the PING or TRACERTE parameter specified.

**System Action:** None.

**User Response:** Do the following:

1. Determine why a socket could not be opened and correct the problem.
2. Enter the ZDTCP command again with the PING or TRACERTE parameter specified.

See *TPF Operations* for more information about the ZDTCP command.

### DTCP0024E ERROR IN PING SENDTO *error_number*

**Where:**

*error_number*
The socket application programming interface (API) error number.

**Explanation:** An error occurred when a `sendto()` function attempted to ping a host. This message was in response to the ZDTCP command with the PING parameter specified.

**System Action:** None.

**User Response:** See your network administrator to determine and correct the problem.

See *TPF Operations* for more information about the ZDTCP command.

### DTCP0025E TIMEOUT WAITING FOR PING RESPONSE

**Explanation:** A timeout occurred while a `select` function waited for a ping to return from a host. The default waiting time for the ZDTCP command with the PING parameter specified is 1 second. Timeouts commonly occur when the network is slow.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZDTCP command with the PING parameter and the Timeout option specified to increase the length of time to wait.
2. See your network administrator to determine and correct the network timing problem if the problem continues.

See *TPF Operations* for more information about the ZDTCP command.

### DTCP0026E ERROR WAITING FOR PING RESPONSE *error_number*

**Where:**

*error_number*
The socket application programming interface (API) error number.

**Explanation:** An error occurred while a `select` function waited for a ping to return from a host. This message was in response to the ZDTCP command with the PING parameter specified.

**System Action:** None.

**User Response:** Do the following:

- See your network administrator to determine and correct the network problem if the problem continues.
- Enter the ZDTCP command with the PING parameter specified.

See *TPF Operations* for more information about the ZDTCP command.

**DTCP0027I ERROR READING PING ICMP PACKET** *error_number*

**Where:**

*error_number*
The socket application programming interface (API) error number.

**Explanation:** An error occurred when a `recvfrom()` function attempted to read an Internet Control Message Protocol (ICMP) packet returned by a ping to a host. This message was in response to the ZDTCP command with the PING parameter specified.

**System Action:** The ZDTCP command with the PING parameter specified continues processing.

**User Response:** Have your network administrator determine and correct the network problem if the problem continues.

See *TPF Operations* for more information about the ZDTCP command.

**DTCP0028E TRACERTE MALLOC FAILED**

**Explanation:** The ZDTCP command with the TRACERTE parameter specified uses the `malloc` C function to allocate storage used for the Internet Control Message Protocol (ICMP) packets sent out; however, `malloc` storage is not available.

**System Action:** None.

**User Response:** Do the following:

1. Determine why `malloc` storage is not available and correct the problem.
2. Enter the ZDTCP command again with the TRACERTE parameter specified.

See *TPF Operations* for more information about the ZDTCP command.

**DTCP0030E ERROR ON SENDTO -** *error_number*

**Where:**

*error_number*
The socket application programming interface (API) error number.

**Explanation:** An error occurred when a `sendto()` function transmitted an Internet Control Message Protocol (ICMP) packet to a host. This message was in response to the ZDTCP command with the TRACERTE parameter specified.

**System Action:** None.

**User Response:** Do the following:

1. Have your network administrator determine and correct the network problem.
2. Enter the ZDTCP command again with the TRACERTE parameter specified.

See *TPF Operations* for more information about the ZDTCP command.

**DTCP0031E IP ADDRESS IS NOT VALID**

**Explanation:** The ZDTCP command with the DNS parameter specified was entered to set the primary or secondary Domain Name System (DNS) server Internet Protocol (IP) address. You defined a value for the DNS parameter that was not a valid IP address.

**System Action:** The ZDTCP command was rejected.

**User Response:** Enter the ZDTCP command again specifying a valid IP address.

See *TPF Operations* for more information about the ZDTCP command.

**DTCP0040I NO ENTRIES IN THE TCP/IP NETSTAT TABLE**

**Explanation:** This message is issued in response to the ZDTCP command with the NETSTAT parameter specified. There are currently no entries in the Transmission Control Protocol/Internet Protocol (TCP/IP) NETSTAT table because no sockets have been opened. This message is issued only in CRAS state or higher.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTCP command.

**DTCP0041E TCP/IP CONFIGURATION TABLE DOES NOT EXIST**

**Explanation:** This message is issued in response to the ZDTCP command with the NETSTAT parameter specified. The TPF system attempted to obtain the address of the Transmission Control Protocol/Internet Protocol (TCP/IP) configuration table from keypoint 2, but the address did not exist. This message is issued only in CRAS state or higher.

**System Action:** NETSTAT parameter data is not displayed.

**User Response:** Do the following:

1. Enter the ZCTKA ALTER command with the SSPS parameter specified to increase the amount of system heap storage in the TPF system.
2. Perform an initial program load (IPL) of the TPF system.
3. If increasing the amount of heap storage with the ZCTKA ALTER command does not correct the problem, have your system programmer determine the cause of the problem and correct the error.

See *TPF Operations* for more information about the ZDTCP and ZCTKA ALTER commands.

**DTCP0042E TCP/IP NETSTAT TABLE DOES NOT EXIST**

**Explanation:** This message is issued in response to the ZDTCP command with the NETSTAT parameter specified. The TPF system attempted to obtain the address of the Transmission Control Protocol/Internet Protocol (TCP/IP) NETSTAT table from the TCP/IP configuration table, but the address did not exist. This message is issued only in CRAS state or higher.

**System Action:** The NETSTAT table is not displayed.

**User Response:** Do the following:

1. Enter the ZCTKA ALTER command with the SSPS parameter specified to increase the amount of system heap storage in the TPF system.
2. Perform an initial program load (IPL) of the TPF system.

See *TPF Operations* for more information about the ZDTCP and ZCTKA ALTER commands.

---

**DTCP0043E MALOC ERROR, NETSTAT ENDED**

**Explanation:** The ZDTCP command with the NETSTAT parameter specified was entered, but the TPF 4.1 system was unable to allocate enough storage to display the information.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine why there is not enough storage and correct the problem.
2. Enter the ZDTCP command again with the NETSTAT parameter specified.

See *TPF Operations* for more information about the ZDTCP command.

---

**DTCP0051E NETWORK ERROR** *error_number*

**Where:**

*error_number*
The socket Application Programming Interface (API) error number

**Explanation:** The ZDTCP command was entered with the NSLOOKUP, PING, or TRACERTE parameter specified, but an error occurred while resolving the specified symbolic name to its dotted decimal form.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZDTCP command as many times as necessary with the NSLOOKUP, PING, or TRACERTE parameter specified. Changing to the dotted decimal form will bypass this failing address resolution.
2. If the error continues, see your network administrator.

See *TPF Operations* for more information about the ZDTCP command.

---

**DTCP0052E NETWORK IS SLOW - TRY AGAIN**

**Explanation:** The ZDTCP command was entered with the NSLOOKUP, PING, or TRACERTE parameter specified. The host name specified must be changed to a network Internet Protocol (IP) address, but the network is running too slowly for the specified name servers to reply in time.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZDTCP command as many times as necessary with the NSLOOKUP, PING or TRACERTE parameter specified.
- Substitute the dotted decimal address for the host name.
- If the network continues to be slow, see your network administrator.

See *TPF Operations* for more information about the ZDTCP command.

---

**DTCP0053E NO RECOVERY**

**Explanation:** The ZDTCP command was entered with the NSLOOKUP, PING, or TRACERTE parameter specified. The request made to the name servers for name or address resolution ended in an error and there is no recovery.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZDTCP command as many times as necessary with the NSLOOKUP, PING or TRACERTE parameter specified.
- Substitute the dotted decimal address for the host name.
- If the network problem continues, see your network administrator.

See *TPF Operations* for more information about the ZDTCP command.

---

**DTCP0054E NO DATA RETURNED**

**Explanation:** The ZDTCP command was entered with the NSLOOKUP, PING, or TRACERTE parameter specified. The request made to the name servers for name or address resolution returned, but did not contain any data.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZDTCP command as many times as necessary with the NSLOOKUP, PING or TRACERTE parameter specified.
- Substitute the dotted decimal address for the host name.
- If the network problem continues, see your network administrator.

See *TPF Operations* for more information about the ZDTCP command.

---

**DTCP0057E BIND FAILED WITH ERROR VALUE** *errvalue*

**Where:**

*errvalue*
The error code as defined in the `socket.h` header file that identifies the reason for the `bind` function failure.

**Explanation:** A ZDTCP command was entered with the LOCAL parameter specified, but the attempt by the TPF system to `bind` using the local Internet Protocol (IP) address failed. The `sock_errno` function returned the error code.

**System Action:** The command is rejected.

**User Response:** Examine the error code definition for *errvalue* in the `socket.h` header file to determine where the `bind` function failed.

See *TPF Operations* for more information about the ZDTCP command. See *TPF Transmission Control Protocol/Internet*

*Protocol* for more information about the `bind` and `sock_errno` functions.

**DTCP0060E LOCAL IP ADDRESS IS NOT ALLOWED**

**Explanation:** The ZDTCP command was entered, but the Internet Protocol (IP) address specified for the LOCAL parameter is not allowed by the TPF system. The following IP addresses are not allowed:

- 0.0.0.0
- 255.255.255.255
- 127.0.0.0

**System Action:** The command is rejected.

**User Response:** Enter the ZDTCP command again and specify the correct IP address for the LOCAL parameter.

See *TPF Operations* for more information about the ZDTCP command.

**DTCP0061E LOCAL IP ADDRESS IS NOT VALID**

**Explanation:** A ZDTCP command was entered with the PING or TRACERTE parameter and the LOCAL parameter specified, but the local Internet Protocol (IP) address specified is not in correct numeric format.

**System Action:** The command is rejected.

**User Response:** Enter the ZDTCP command again specifying the PING or TRACERTE parameter and an IP address for the LOCAL parameter in correct numeric format.

See *TPF Operations* for more information about the ZDTCP command.

**DTIM0001I SUBSYSTEM *xxxx* LOCAL STANDARD TIME**

**Where:**

*xxxx*
The subsystem name.

**Explanation:** This is the normal response to the ZDTIM command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTIM command.

**DTIM0002I SYSTEM LOCAL STANDARD TIME**

**Explanation:** This is the normal response to the ZDTIM command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTIM command.

**DTIM0003I SUBSYSTEM *xxxx* CLOCKS ARE NOT RUNNING**

**Where:**

*xxxx*
The subsystem name.

**Explanation:** The subsystem specified in the message is in 1052 state, is in the process of cycling above 1052 state, or is in the process of cycling down to 1052 state. In any case, the subsystem clocks are not running.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTIM command.

**DTIM0004I SUBSYSTEM *xxxx* WAS NEVER CYCLED ABOVE 1052 STATE**

**Where:**

*xxxx*
The subsystem name.

**Explanation:** The subsystem specified in the message was never cycled above 1052 state. In any case, the subsystem clocks are not running.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTIM command.

**DTIM0021I *nnn* MIDNIGHTS WILL BE CROSSED WHEN CYCLING ABOVE 1052 STATE**

**Where:**

*nnn*
The number of midnights that are crossed while cycling above 1052 state.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTIM command.

**DTIM0022I SUBSYSTEM TIME DIFFERENCE FROM SYSTEM CLOCK IS *mmmmmmm* MINUTES**

**Where:**

*mmmmmmm*
The number of minutes.

**Explanation:** This message is generated in conjunction with the DTIM0021I message to assist you when deciding whether or not an alter time request is required. The time stamp for these messages will be 00.00.00.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTIM command.

---

**DTIM0032I ALL OTHER SUBSYSTEM CLOCKS ARE NOT RUNNING**

**Explanation:** All the other subsystems are in 1052 state, in the process of cycling above 1052 state, or in the process of cycling down to 1052 state. In any case, their subsystem clocks are not running.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTIM command.

---

**DTIM0033I NO SUBSYSTEM CLOCKS ARE RUNNING**

**Explanation:** The subsystem clocks are not running.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTIM command.

---

**DTIM0051E INVALID FORMAT OR FUNCTION NOT VALID EXCEPT IN BSS**

**Explanation:** A parameter was specified that is not valid or the command was entered from a subsystem other than the basic subsystem (BSS).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTIM command.

---

**DTIM0052T FACE ERROR**

**Explanation:** The file address compute (FACE) program returned an error code while trying to find the subsystem clock record.

**System Action:** None.

**User Response:** Report this error to your system support personnel.

See *TPF Operations* for more information about the ZDTIM command.

---

**DTIM0053T FIND ERROR**

**Explanation:** A FIND returned an error code while trying to find the subsystem clock record.

**System Action:** None.

**User Response:** Report this error to your system support personnel.

See *TPF Operations* for more information about the ZDTIM command.

---

**DTIM0054T INVALID REQUEST AT THIS TIME**

**Explanation:** The user requested to display a subsystem clock before the TPF system clock was initialized.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTIM command.

---

**DTIM0055T INVALID REQUEST — STR NOT AVAILABLE TO THIS PROCESSOR**

**Explanation:** The user requested to display the Sysplex Timer (STR) time but the processor was not directly connected to an STR.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** Enter the command again from a processor that is directly connected to an STR.

See *TPF Operations* for more information about the ZDTIM command.

---

**DTIM0056T UNABLE TO READ STR DATA**

**Explanation:** An unsuccessful attempt was made to retrieve the Sysplex Timer (STR) time when a ZDTIM STR command was entered.

**Note:** The IBM 9037 Sysplex Timer is part of the IBM Enterprise Systems Connection (ESCON) Architecture.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTIM command.

---

**DTIM0057T INVALID REQUEST — ALTPORT PARAMETER NOT ALLOWED**

**Explanation:** When running under PR/SM, the ALTPORT parameter is not allowed on the ZDTIM command.

**System Action:** None.

**User Response:** Enter the ZDTIM command again without specifying the ALTPORT parameter.

See *TPF Operations* for more information about the ZDTIM command.

---

**DTOD0001I DATE TIME TODCLOCK CURRENT**
*mm/dd/yyyy hh.mm.ss todclock*

**Where:**

*mm/dd/yyyy*
The month, day, and year.

*hh.mm.ss*
The hour, minute, and second.

*todclock*
The time-of-day (TOD) clock value, which is 16 hexadecimal digits.

**Explanation:** This is the normal response to the ZDTOD command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTOD command and for an example of the informational display. See *TPF System Generation* for more information about the CONFIG macro and date formats.

---

**DTOD0002I DATE TIME TODCLOCK INPUT** *mm/dd/yyyy hh.mm.ss todclock*

**Where:**

*mm/dd/yyyy*
The month, day, and year.

*hh.mm.ss*
The hour, minute, and second.

*todclock*
The time-of-day (TOD) clock value, which is 16 hexadecimal digits.

**Explanation:** This is the normal response to the ZDTOD command when a TOD clock value or a date and time are specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDTOD command and for an example of the informational display. See *TPF System Generation* for more information about the CONFIG macro and date formats.

---

**DTOD0003E INVALID INPUT FORMAT**

**Explanation:** The format of the ZDTOD command is not correct.

**System Action:** The ZDTOD command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZDTOD command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZDTOD command.

---

**DUMP0000I ZDUMP–OK**

**Explanation:** This is the normal response to the ZDUMP command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDUMP command.

---

**DUMP0009E ZDUMP–INVALID PARAMETER**

**Explanation:** A parameter other than SEL or ALL was specified.

**System Action:** ZDUMP processing is exited.

**User Response:** Specify a valid parameter or allow it to default.

See *TPF Operations* for more information about the ZDUMP command.

---

**DVSN0000I VSN ON DISK** *ccud* **IS** *vvvvvv*

**Where:**

*ccud*
The device address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** This is the normal response to the ZDVSN command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDVSN command.

---

**DVSN0065T INVALID INPUT MESSAGE FORMAT — VSN CANNOT BE INCLUDED**

**Explanation:** The command was entered with text, which was taken as a volume serial number (VSN), after the device address. A VSN must not be part of the ZDVSN command.

**System Action:** Program processing is ended. The VSN on the device is not displayed.

**User Response:** Enter the command again without the text following the device address.

See *TPF Operations* for more information about the ZDVSN command.

---

**DVSN0088T TO DEVICE UNUSABLE**

**Explanation:** This error occurred while processing the ZDVSN command. An attempt was made to mount a device through CPAB but an input/output (I/O) error occurred while trying to mount the 3990 Record Cache Subsystem device.

**System Action:** Program processing is ended. The volume serial number (VSN) on the device is not displayed.

**User Response:** See your IBM service representative.

See *TPF Operations* for more information about the ZDVSN command.

---

**DVSN0090T ATTEMPT TO MOUNT REQUESTED VOLUME** *ccud* **FAILED**

**Where:**

*ccud*
The device address.

**Explanation:** This error occurred during processing of the

ZAVSN command. An attempt was made to mount the requested volume through CPAA but an error occurred during mount processing. Because of this error, the volume could not be used.

At the time the problem was detected, a more detailed diagnostic message was issued by CPAA to describe the reason that the volume could not be mounted to the TPF system. That message, which has a CPAA prefix, will precede the DVSN0090T message on your console.

**System Action:** Program processing is ended. The volume serial number (VSN) on the device is not displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZDVSN command.

# DYDA–DYD9

### DYDA0001I PSTXCUR HAS BEEN CREATED

**Explanation:** This is the normal response to the ZPOOL GENERATION command with the INIT parameter specified indicating that the current pool segment table (#PSTXCUR) records have been built successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

### DYDA0002E PSTXCUR FACE ERROR - ORDINAL *ordnum*

**Where:**

*ordnum*
The hexadecimal ordinal number of a PSTXCUR record.

**Explanation:** The program that initializes the PSTXCUR and PSTXNEW records, which are used to generate pools, detected a file address compute (FACE) program error while trying to retrieve a PSTXCUR record.

**System Action:** Processing continues.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

See *TPF System Macros* and *TPF Application Programming* for more information about the FACE program and FACE interface.

### DYDA0003E PST RECORD FIND ERROR - FILE ADDRESS *fileaddr*

**Where:**

*fileaddr*
The hexadecimal file address of a PSTXCUR or PSTXNEW record.

**Explanation:** The program that initializes the PSTXCUR and PSTXNEW records, which are used to generate pools, detected an error while attempting to retrieve a PSTXCUR or PSTXNEW record by using the FINWC macro.

**System Action:** Processing continues.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

See *TPF System Macros* and *TPF Application Programming* for more information about the FACE program and FACE interface. See *TPF General Macros* for more information about the FINWC macro.

### DYDA0004E PSTXNEW FACE ERROR - ORDINAL *ordnum*

**Where:**

*ordnum*
The hexadecimal ordinal number of a PSTXNEW record.

**Explanation:** The program that initializes the PSTXCUR and PSTXNEW records, which are used to generate pools, detected a file address compute (FACE) program error while trying to retrieve a PSTXNEW record.

**System Action:** Processing continues.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

See *TPF System Macros* and *TPF Application Programming* for more information about the FACE program and FACE interface.

### DYDD0001T SYSTEM NOT IN 1052/UTILITY STATE — CANCELLED

**Explanation:** The TPF system must be in 1052 state or UTIL state to process a pool area deactivation request.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Ensure the TPF system is in 1052 or UTIL state.
2. Enter the command again.

See *TPF Operations* for more information about the ZSDEA command. See *TPF Database Reference* for more information about online pool area deactivation.

### DYDD0002I MOUNT DGF

**Explanation:** This is a normal response to the ZSDEA command.

**System Action:** None.

**User Response:** Mount the pool maintenance general file (DGF) as requested so that online pool area deactivation can continue.

See *TPF Operations* for more information about the ZSDEA command. See *TPF Database Reference* for more information about online pool area deactivation.

### DYDD0003I ONLINE DEACTIVATION STARTED

**Explanation:** This is a normal response to the ZSDEA command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSDEA command. See *TPF Database Reference* for more information about online pool area deactivation.

### DYDD0004T CY9KP FIND ERROR

**Explanation:** An error occurred while attempting to retrieve the pool maintenance keypoint record (CY9KP) during online pool area deactivation.

**System Action:** None.

**User Response:** Have your system programmer determine why the CY9KP find request failed.

See *TPF Operations* for more information about the ZSDEA command. See *TPF Database Reference* for more information about online pool area deactivation.

### DYDD0005T CYSDR *xxxx* ERR

**Where:**

*xxxx*
Can be FIND, FILE, or FACE.

**Explanation:** One of the following occurred:

- If *xxxx* is FIND, an error occurred while trying to retrieve the directory record (CYSDR) during online pool area deactivation.
- If *xxxx* is FILE, an error occurred while trying to file the directory record (CYSDR) during online pool area deactivation.
- If *xxxx* is FACE, a file address compute (FACE) program error occurred while trying to locate the directory record (CYSDR) during online pool area deactivation.

**System Action:** The ZSDEA function ends. If the error is a FACE error, then a dump is also issued.

**User Response:** Have your system programmer determine why there was a error during the request.

See *TPF Operations* for more information about the ZSDEA command. See *TPF Database Reference* for more information about online pool area deactivation.

### DYDD0006W THERE ARE NO SEGMENTS TO DEACTIVATE

**Explanation:** The ZSDEA command was entered, but there are no pool segments to deactivate.

**System Action:** No deactivation occurs.

**User Response:** See *TPF Operations* for more information about the ZSDEA command. If you want to deactivate pool segments, see *TPF Database Reference* for more information about the pool generation and reallocation procedure.

### DYDE0000I DYDU - END OF DUPL CHECK PASS

**Explanation:** This is a normal response to the ZDUPD command specifying the S parameter.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDUPD command.

### DYDE0002E FACE/FIND ERROR EXCLUSION TABLE RECORD

**Explanation:** The ZDUPD command was entered but an error condition was detected while trying to retrieve (using the FACE, FIWHC, FILUC, or WAITC macro) the recoup FC33 exclusion table record (index for exclusion processing for pool directory update (PDU) processing).

**System Action:** None.

**User Response:** Check the exclusion record that is indexed by the recoup FC33 exclusion table (#EXCTBL) to determine the cause of the problem.

See *TPF Operations* for more information about the ZDUPD command.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF General Macros* for more information about the FIWHC, FILUC, and WAITC macros.

### DYDE0008I ENTER: ZDUPD C - TO CONTINUE OR ZDUPD A - TO ABORT

**Explanation:** This is a normal response to the ZDUPD command specifying the S parameter.

**System Action:** None.

**User Response:** Do one of the following:

- Enter ZDUPD C to roll in pool directory update (PDU) processing.
- Enter ZDUPD A to end ZDUPD command processing.

See *TPF Operations* for more information about the ZDUPD command.

### DYDE0011E FACE/FIND/FILE ERROR ON FC33 ORDINAL *ordnum*

**Where:**

*ordnum*
The hexadecimal ordinal number of a released pool address (FC33) record.

**Explanation:** The ZDUPD command was entered, but pool directory update (PDU) processing received one of the following errors:

- A file address compute (FACE) program find error while trying to retrieve the FC33 record.
- A FINWC macro error while trying to retrieve the FC33 record.

- A FILNC or WAITC macro error while trying to file the FC33 record.

**System Action:** PDU processing continues.

**User Response:** Determine the cause of the problem.

See *TPF Operations* for more information about the ZDUPD command. See *TPF System Macros* and *TPF Application Programming* for more information about the FACE program and the FACE interface. See *TPF General Macros* for more information about the FINWC, FILNC, and WAITC macros.

---

**DYDG0020A —PLS MOUNT D/B GEN. FILE**

**Explanation:** The pool maintenance general file (DGF) is not mounted and it is required for online directory generation to run.

**System Action:** None.

**User Response:** Mount the DGF as requested so that online directory generation can continue.

See *TPF Database Reference* for more information about online directory generation.

---

**DYDG0026E --- FACS ERROR ON** *rcdtyp*, **ORDINAL** *ordnum*

**Where:**

*rcdtyp*
Record type.

*ordnum*
Record ordinal number.

**Explanation:** The ZPOOL GENERATION command was entered, but an error occurred while calculating the file address for the record type and ordinal number.

**System Action:** The pool generation process ends.

**User Response:** Do the following:

1. Analyze the FACE table, verifying that the record type is correctly defined and that enough ordinals have been defined.
2. Correct the FACE table.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command. See *TPF System Macros* and *TPF Application Programming* for more information about the FACS program and the FACS interface.

---

**DYDG0027E --- FIND ERROR ON** *rcdtyp*, **ADDRESS** *faddr*

**Where:**

*rcdtyp*
Record type.

*ordnum*
File address.

**Explanation:** The ZPOOL GENERATION command was entered, but a find error occurred.

**System Action:** The pool generation process ends.

**User Response:** Do the following:

1. Determine why the fixed file record type could not be found.
2. Correct the error.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYDG0082E —INVLD MESSAGE NUMBER**

**Explanation:** The DYOM message sending program was called with a message number that is not valid (greater than the maximum message code defined).

**System Action:** None.

**User Response:** Have your system programmer determine why DYOM is being called with a invalid message number that is not valid.

---

**DYDG0083E —INVLD SS–NAME**

**Explanation:** An error occurred while trying to obtain the current subsystem name with UATBC.

**System Action:** Online directory generation is ended with a dump.

**User Response:** Have your system programmer determine why the current subsystem information in the entry control block (ECB) was not valid.

See *TPF Database Reference* for more information about online directory generation.

---

**DYDG0084E — INVLD D/B GEN FILE**

**Explanation:** The subsystem name field on the pool maintenance general file (DGF) currently mounted does not match the subsystem running the online directory generation.

**System Action:** Online directory generation is ended with a dump.

**User Response:** Do one of the following:

- Make sure the correct DGF for this subsystem is mounted.
- If this error occurs with the correct DGF for this subsystem mounted, check the DGF to determine the source of the bad data.

See *TPF Database Reference* for more information about online directory generation.

---

**DYDG0091E —INVALID RCC.**

**Explanation:** The directory read from the pool maintenance general file (DGF) failed record code check validation.

**System Action:** Online directory generation is ended with a dump.

**User Response:** Check the DGF to determine the source of the bad data.

See *TPF Database Reference* for more information about the online directory generation.

---

**DYDG0092E —FACE ERR —ORD TOO HIGH**

**Explanation:** There was a file address compute (FACE) program error. The ordinal number specified exceeds the maximum ordinal number defined for the record type.

**System Action:** Online directory generation is ended with a system error dump.

**User Response:** Have your system programmer determine the cause of the FACE error and correct it.

See *TPF Database Reference* for more information about online directory generation.

**DYDG0093E —FACE ERR — INVALID REC TYPE**

**Explanation:** There was a file address compute (FACE) program error. The record type is not valid.

**System Action:** Online directory generation is ended with a system error dump.

**User Response:** Have your system programmer determine the cause of the FACE error and correct it.

See *TPF Database Reference* for more information about online directory generation.

**DYDG0095E —DIR CHECK SUM ERR**

**Explanation:** During validation or a directory read from the pool maintenance general file (DGF), the calculated check sum value did not match the check sum field in the directory. The directory may have been corrupted.

**System Action:** Online directory generation is ended with a dump.

**User Response:** Check the DGF to determine the source of the bad data.

See *TPF Database Reference* for more information about online directory generation.

**DYDG0096E —DIR ORD NO. SEQ ERR**

**Explanation:** The directory sequence number just read indicates that the directories are out of sequence on the pool maintenance general file (DGF).

**System Action:** Online directory generation is ended with a dump.

**User Response:** Check the DGF to determine the source of the bad data.

See *TPF Database Reference* for more information about online directory generation.

**DYDG0097E —INVALID ID**

**Explanation:** One of the following occurred:

- An unexpected record ID was found when trying to read the pool descriptor record (CYPDR).
- Unexpected data was found when trying to read CTK9 from the pool maintenance general file (DGF).

**System Action:** Online directory generation is ended with a dump.

**User Response:** Determine the source of the bad data.

See *TPF Database Reference* for more information about online directory generation.

**DYDG0099E —I/O ERROR**

**Explanation:** An input/output (I/O) error occurred during a find or file request.

**System Action:** Online directory generation is ended with a dump.

**User Response:** Check for any related messages at the console that may indicate the cause of the I/O error. If necessary, review the system error dump for additional information.

See *TPF Database Reference* for more information about online directory generation.

**DYDI0002W FACE/FIND/FILE ERROR ON FC33 ORDINAL 00000064**

**Explanation:** The ZDUPD command was entered but pool directory update (PDU) processing received one of the following errors:

- FACE find error trying to retrieve the released pool address (FC33) ordinal #64.
- FIWHC find error trying to retrieve the FC33 ordinal #64.
- FILNC or WAITC file error trying to file the FC33 ordinal #64.

**System Action:** None.

**User Response:** Determine the cause of the problem.

See *TPF Operations* for more information about the ZDUPD command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface. See *TPF General Macros* for more information about the FIWHC, FILNC, and WAITC macros.

**DYDI0006I -START OF DIRECTORY UPDATE VERIFY**

**Explanation:** This is the normal response to the ZDUPD command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDUPD command. See *TPF Database Reference* for more information about online pool directory update.

**DYDI0081E - SEL/EXC UPDATE WAS ACTIVE - PDU HAS BEEN ABORTED AND MUST BE REVERIFIED**

**Explanation:** The ZDUPD command was entered specifying the C parameter to rollin the pool directory update (PDU) but a previous rollin was active.

**System Action:** The command fails.

**User Response:** Do the following:

- Enter the ZDUPD command again specifying the S parameter.

- Enter the ZDUPD command again specifying the C parameter.

See *TPF Operations* for more information about the ZDUPD command.

---

**DYDI0082E - SAVE/NOSAVE MUST BE SPECIFIED FOR SEL/EXC**

**Explanation:** The ZDUPD command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the ZDUPD command again using the correct format.

See *TPF Operations* for more information about the ZDUPD command.

---

**DYDI0083E - MAX NUMBER OF POOL TYPES FOR SEL/EXC IS 5**

**Explanation:** The ZDUPD command was entered but too many pool types were specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZDUPD command.

---

**DYDI0084E - INVALID POOL TYPE SPECIFIED FOR SEL/EXC**

**Explanation:** The ZDUPD command was entered specifying an incorrect pool type.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify correct pool types.

See *TPF Operations* for more information about the ZDUPD command.

---

**DYDI0085E - PDU CREATE HAS NOT BEEN RUN, JOB ABORTED**

**Explanation:** The ZDUPD command was entered but the ZRPDU CREATE command has not been entered and pseudo directories have not been built.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZRPDU CREATE command.
2. Enter the ZDUPD command again.

See *TPF Operations* for more information about the ZRPDU CREATE and ZDUPD commands.

---

**DYDI0088E -NO NEW PSEUDO DIRECTORIES - PDU CREATE MUST BE RUN PRIOR TO PDU VERIFY/ROLLIN**

**Explanation:** The ZDUPD command was entered but the ZRPDU CREATE command has not been entered and pseudo directories have not been built.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZRPDU CREATE command.
2. Enter the ZDUPD command again.

See *TPF Operations* for more information about the ZRPDU CREATE and ZDUPD commands.

---

**DYDI0092E - INCORRECT INPUT MESSAGE - DIRECTORY VERIFY**

**Explanation:** The ZDUPD command was entered specifying a parameter other than S but pool directory update (PDU) verify processing has not been run.

**System Action:** The command is rejected.

**User Response:** Enter the ZDUPD command specifying the S parameter to start PDU verify processing.

See *TPF Operations* for more information about the ZDUPD command.

---

**DYDI0093A - PDU VERIFY ABORTED, RERUN VERIFY OR ABORT PDU CREATE**

**Explanation:** The ZDUPD command was entered specifying the A parameter, which caused pool directory update (PDU) verify processing to end.

**System Action:** PDU verify processing ends.

**User Response:** Do the following:

1. Enter the ZDUPD command specifying the S parameter, to run PDU verify processing again.
2. Enter the ZDUPD command specifying the C parameter, to complete PDU verify processing.

See *TPF Operations* for more information about the ZDUPD command.

---

**DYDI0094E - PDU ROLLIN ABORTED, PSEUDO DIRECTORIES NO LONGER VALID, ABORT PDU CREATE**

**Explanation:** The ZDUPD command was entered specifying the A parameter, which caused PDU verify processing to end.

**System Action:** Pool directory update (PDU) rollin ends and a restart of PDU is inhibited.

**User Response:** Enter **ZRPDU ABORT BP** to clear the previous function and begin again.

See *TPF Operations* for more information about the ZDUPD and ZRPDU ABORT commands.

---

**DYDI0095E - INCORRECT ENTRY, PDU ROLLIN IN PROGRESS**

**Explanation:** The ZDUPD command was entered specifying the C parameter, but pool directory update (PDU) rollin is already running.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZDUPD command.

**DYDI0096E - RESTART NOT VALID AT THIS TIME**

**Explanation:** The ZDUPD command was entered specifying the R parameter but pool directory update verify and rollin processing cannot be restarted now.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZDUPD command.

**DYDI0097E - PDU VERIFY ACTIVE AT THIS TIME**

**Explanation:** The ZDUPD command was entered specifying the S parameter, but it had already been entered.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZDUPD command.

**DYDI0098I - START OF DIRECTORY UPDATE ROLLIN**

**Explanation:** This is the normal response to the ZDUPD command specifying the C parameter.

**System Action:** None.

See *TPF Operations* for more information about the ZDUPD command.

**DYDI0099E - GENERAL FILE NOT REQUESTED - PLEASE DISMOUNT - PDU WILL CONTINUE**

**Explanation:** The ZDUPD command was entered but the pool maintenance general file (DGF) is mounted.

**System Action:** None.

**User Response:** Dismount the DGF.

See *TPF Operations* for more information about the ZDUPD command.

**DYDN0001E RECOUP - ONLINE MULTIPLE RELEASE ANALYSIS FACE ERROR - POOL TYPE IS CY3RCC SEE MACROS CY3DR CZ1GF POOL ORDINAL** *ordnum* **POOL TYPE** *pooltype*

**Where:**

*ordnum*
The ordinal number of a pool record.

*pooltype*
The type of pool file.

**Explanation:** The ZDUPD command was entered specifying the C parameter but an error condition was detected by a FACE-type call during the recording of online multiple releases.

**System Action:** Recoup processing continues.

See *TPF Operations* for more information about the ZDUPD command.

**User Response:** Investigate the pool record indicated in this message.

See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

**DYDN0002E RECOUP - ONLINE MULTIPLE RELEASE ANALYSIS FIND ERROR OCCURED FARW =** *farw*

**Where:**

*farw*
The file address reference word that is used to read the record.

**Explanation:** The ZDUPD command was entered specifying the C parameter but a find error condition was detected during the recording of online multiple releases.

**System Action:** Recoup processing continues.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZDUPD command again.

See *TPF Operations* for more information about the ZDUPD command.

**DYDO0002I EOJ**

**Explanation:** This is a normal response to the ZDUPD command specifying the E parameter indicating the end of the display.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDUPD command.

**DYDO0003E RETRIEVAL FAILED**

**Explanation:** The ZDUPD command was entered specifying the E parameter but a record could not be retrieved from the online multiple release database.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

3. Enter the ZDUPD command again.

See *TPF Operations* for more information about the ZDUPD command.

---

**DYDO0004I MAX ITEMS RETRIEVED**

**Explanation:** The ZDUPD command was entered specifying the E parameter but there were more online multiple releases than could be displayed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDUPD command.

---

**DYDO0005E UNABLE SYSTEM NOT IN NORM STATE**

**Explanation:** The ZDUPD command was entered specifying the E parameter but the TPF system is not in NORM state.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Cycle the TPF system to NORM state.
2. Enter the ZDUPD command again.

See *TPF Operations* for more information about the ZDUPD command.

---

**DYDO0006E ERROR -DISPLAY TERMINATED**

**Explanation:** The ZDUPD command was entered specifying the E parameter but there was an error that caused the command to fail.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZDUPD command again.

See *TPF Operations* for more information about the ZDUPD command.

---

**DYDO0007I DYDU MULTIPLE RELEASE ANALYSIS ONLINE UPDATE RUN ON *ddmmmyy* AT *hh.mm.ss***

**Where:**

*ddmmmyy*
The day, month, and year.

*hh.mm.ss*
The hour, minute, and second.

**Explanation:** This is a normal response to the ZDUPD command with the E parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDUPD command.

---

**DYDU0006I -START OF DIRECTORY UPDATE VERIFY**

**Explanation:** This is a normal response to the ZDUPD command specifying the S parameter.

**System Action:** Pseudo directory verification begins.

**User Response:** None.

See *TPF Operations* for more information about the ZDUPD command.

---

**DYDU0007I —DIR UPDATE ABORT**

**Explanation:** This is a response to the ZDUPD A command or follows a fatal error detected by the directory update routines.

**System Action:** Directory update is ended.

**User Response:** None.

See *TPF Operations* for more information about the ZDUPD command. See *TPF Database Reference* for more information about online pool directory update.

---

**DYDU0008I —REAL AND PS DIRS MISMATCH, REAL ORD IS *xxxxxxxx*.**

**Where:**

*xxxxxxxx*
The ordinal number.

**Explanation:** During directory update, the base module number in a pseudo directory read from the pool maintenance general file (DGF) does not match the base module number of the corresponding online directory. The ordinal number of the online directory is displayed in the message.

**System Action:** The directory update is continued with the next pseudo directory on the DGF.

**User Response:** Determine the cause for the mismatch. Possible causes include:

- The pool configuration data used for offline directory update does not match the configuration of the online system.
- The offline directory or online directory was corrupted.

See *TPF Operations* for more information about the ZDUPD command. See *TPF Database Reference* for more information about online pool directory update.

---

**DYDU0009I —DIRECTORY UPDATE RESTART BEGUN**

**Explanation:** This is the normal response to the ZDUPD command with the R parameter specified if a directory update address roll-in phase was running prior to a TPF system crash.

**System Action:** The address roll-in phase of directory update is restarted at the point it ended.

**User Response:** None.

See *TPF Operations* for more information about the ZDUPD command. See *TPF Database Reference* for more information about online pool directory update.

---

**DYDU0020A —PLS MOUNT D/B GEN. FILE**

**Explanation:** A request to start directory update was issued but the pool maintenance general file (DGF) is not mounted to the TPF system.

**System Action:** The directory update is suspended until the pack is mounted.

**User Response:** Mount the DGF.

See *TPF Operations* for more information about the ZDUPD command. See *TPF Database Reference* for more information about online pool directory update.

**DYDU0082E —INVLD MESSAGE NUMBER**

**Explanation:** The DYOM message sending program was called with a message number that is not valid (greater than the maximum message code defined).

**System Action:** None.

**User Response:** Have your system programmer determine why DYOM is being called with a message ID that is not valid and correct it.

**DYDU0087E —POOL MAINTENANCE KEYPOINT I/O ERROR**

**Explanation:** A read or write error on the pool maintenance keypoint was detected in the DYDI routine.

**System Action:** The directory update is aborted.

**User Response:** Determine the cause of the error.

See *TPF Operations* for more information about the ZDUPD command. See *TPF Database Reference* for more information about online pool directory update.

**DYDU0088E —NO NEW PSEUDO DIRECTORIES**

**Explanation:** After reading the pool maintenance keypoint, the DYDI segment determined that the pool maintenance general file (DGF) was not initialized for the directory update.

**System Action:** The directory update is aborted.

**User Response:** Ensure that the offline directory update job was run before starting directory updates on the TPF system.

See *TPF Operations* for more information about the ZDUPD command. See *TPF Database Reference* for more information about online pool directory update.

**DYDU0090E —INVALID INPUT MSG**

**Explanation:** A ZDUPD command was entered with an unrecognizable parameter.

**System Action:** The command is ignored.

**User Response:** Enter the command again with a valid parameter.

See *TPF Operations* for more information about the ZDUPD command. See *TPF Database Reference* for more information about online pool directory update.

**DYDU0091E —INVALID RCC.**

**Explanation:** The record code check for a directory read from the pool maintenance general file (DGF) cannot be found in the validation table.

**System Action:** The directory update is aborted.

**User Response:** Check the DGF pool for corruption.

See *TPF Operations* for more information about the ZDUPD command. See *TPF Database Reference* for more information about online pool directory update and for a description of the general file layout.

**DYDU0092E —FACE ERR —ORD TOO HIGH**

**Explanation:** An error was received from FACS when called with the ordinal number from a directory read from the pool maintenance general file (DGF).

**System Action:** The directory update is aborted.

**User Response:** Check the DGF pool for corruption.

See *TPF Operations* for more information about the ZDUPD command. See *TPF Database Reference* for more information about online pool directory update and for a description of the general file layout.

**DYDU0093E —FACE ERR — INVALID REC TYPE**

**Explanation:** An error was received from FACS when called with the #SONRI record type.

**System Action:** The directory update is aborted.

**User Response:** Check the DYDU program for corruption of the record type value.

See *TPF Operations* for more information about the ZDUPD command. See *TPF Database Reference* for more information about online pool directory update.

**DYDU0093A PDU VERIFY ABORTED, RERUN VERIFY OR ABORT PDU CREATE**

**Explanation:** This is a normal response to the ZDUPD command specifying the A parameter.

**System Action:** Pool directory update (PDU) verify processing ends.

**User Response:** Do one of the following:

1. Enter **ZDUPD S** to run PDU verify processing again.
2. Enter **ZRPDU ABORT** to force all PDU processing to end.

See *TPF Operations* for more information about the ZDUPD and ZRPDU ABORT commands.

**DYDU0097E —INVALID ID**

**Explanation:** A record read from the pool maintenance general file (DGF) was not a directory or the pool descriptor record.

**System Action:** The directory update is aborted.

**User Response:** Check the DGF pool for corruption.

See *TPF Operations* for more information about the ZDUPD

command. See *TPF Database Reference* for more information about online pool directory update and for a description of the general file layout.

---

**DYDU0098I - START OF DIRECTORY UPDATE ROLLIN**

**Explanation:** This is a normal response to the ZDUPD command specifying the C parameter, indicating that pool directory update (PDU) rollin processing has started.

**System Action:** Pool directory update (PDU) rollin processing continues.

**User Response:** None.

See *TPF Operations* for more information about the ZDUPD command.

---

**DYDU0099E —I/O ERROR**

**Explanation:** An I/O error occured while trying to access a pseudo directory record or an online directory record while rolling in a pool directory update (PDU).

**System Action:** Pool directory update (PDU) ends without completing.

**User Response:** Do the following:

1. Postprocess the accompanying CTL-44500 dump to determine the cause of the error.
2. Correct the problem.
3. Run PDU processing again.

See *TPF Operations* for more information about the ZDUPD command. See *TPF Database Reference* for more information about online pool directory update.

---

**DYD10001T INPUT TOO BIG FOR OUTPUT AREA** *numbytes* **BYTES ENTRY TERMINATED**

**Where:**

*numbytes*
The number of bytes of the input message.

**Explanation:** The ZPOOL GENERATION command was entered but the length of the specified parameters was too large.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD10002T TOO MANY PARMS ENTERED,** *numparms***. ENTRY TERMINATED.**

**Where:**

*numparms*
The number of parameters specified in a command.

**Explanation:** The ZPOOL GENERATION command was entered with more than 255 parameters specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the ZPOOL GENERATION command again using the correct format.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD10003T LENGTH OF INPUT PARMS EXCESSIVE** *parmlength***. ENTRY TERMINATED.**

**Where:**

*parmlength*
The length of all parameters specified in a command.

**Explanation:** The ZPOOL GENERATION command was entered with the length of all parameters specified with the command greater than 255 bytes.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the ZPOOL GENERATION command again using the correct format.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD10004T TOO MANY PARAMETERS ENTERED** *parmin***, MAX OF 3**

**Where:**

*parmin*
The number of parameters specified in a command.

**Explanation:** The ZPOOL GENERATION command was entered with more than 3 parameters specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the ZPOOL GENERATION command again using the correct format.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD10005E INCORRECT PARAMETER -** *parmentry*

**Where:**

*parmentry*
The parameter that was specified in a command.

**Explanation:** The ZPOOL GENERATION command was entered specifying an incorrect parameter.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.

2. Enter the ZPOOL GENERATION command again using the correct format.

---

**DYD10006T ENTRY MUST BE ZPOOL GENERATION ONLINE ABORT OR ZPOOL GENERATION ONLINE CONTINUE**

**Explanation:** The TPF system is waiting for ZPOOL GENERATION ONLINE ABORT or ZPOOL GENERATION ONLINE CONTINUE to be entered but something else was entered.

**System Action:** The command is rejected.

**User Response:** Enter **ZPOOL GENERATION ONLINE ABORT** or **ZPOOL GENERATION ONLINE CONTINUE**.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD10007T ONLINE ENTRY MADE, BUT, NO OUTSTANDING ZPOOL GENERATION ENTRY FOUND**

**Explanation:** The ZPOOL GENERATION command was entered specifying ONLINE ABORT or ONLINE CONTINUE, but no ZPOOL GENERATION command is pending.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD10008T ENTRY MUST BE ZPOOL GENERATION ONLINE ABORT OR ZPOOL GENERATION ONLINE CONTINUE INVALID PARAMETER FOLLOWING ONLINE**

**Explanation:** The TPF system is waiting for ZPOOL GENERATION ONLINE ABORT or ZPOOL GENERATION ONLINE CONTINUE to be entered but something else was entered.

**System Action:** The command is rejected.

**User Response:** Enter **ZPOOL GENERATION ONLINE ABORT** or **ZPOOL GENERATION ONLINE CONTINUE**.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD10009T ZPOOL GENERATION ENTRY ALREADY IN PROGRESS**

**Explanation:** The ZPOOL GENERATION command was entered but a ZPOOL GENERATION command is already running.

**System Action:** The command is rejected.

**User Response:** None.

---

**DYD10010T INCORRECT RETURN FROM FACZ ORDINAL 0, IFCZRET -** *faczcrc*

**Where:**

*faczcrc*
The FACZC return code.

**Explanation:** The ZPOOL GENERATION command was entered but, internally, an incorrect file address compute (FACE) program type was requested.

**System Action:** The command fails.

**User Response:** Investigate the FACE table for the pool directory update (PDU) pseudo directory (#SONUP).

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD10011T CANNOT RECONFIGURE DIRECTLY INTO SONRI**

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter but the TPF system was requested to reconfigure into the pool rollin directory (#SONRI).

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD10012T PSEUDO DIRECTORY RECORD MISMATCH** *facetype* **- ZPOOL GENERATION LOAD**

**Where:**

*facetype*
The file address compute (FACE) program table record type of a pool directory update (PDU) pseudo directory (#SONUP) record.

**Explanation:** The ZPOOL GENERATION command was entered specifying the LOAD parameter but an error was detected during reallocation.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD30001A CREATE TO SONRI FOR POOL GENS ONLY**

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter, but this would load directly into existing pool rollin directory (#SONRI) records. This message precedes the DYD30002A message.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD30001I NEW POOL DIRECTORIES CREATED**

**Explanation:** This is the normal response to the ZPOOL GENERATION command specifying the CREATE parameter indicating that pool generation is completed.

**System Action:** None.

**User Response:** Follow established procedures for checking the pool generation.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD30001T CREATE ABORTED**

**Explanation:** This is the normal response to the ZPOOL GENERATION command specifying ONLINE ABORT.

**System Action:** The command fails.

**User Response:** None.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD30002A RECONFIGURE WILL NOT BE ALLOWED**

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter but pool generation reconfiguration is not allowed now. This message follows the DYD30001A message.

**System Action:** The command is rejected.

**User Response:** Determine why the ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD30002E INCORRECT RET DYD6 -** *retval*

**Where:**

*retval*
The value returned in the EBCM02 field.

**Explanation:** The ZPOOL GENERATION command was entered specifying the ONLINE ABORT or ONLINE CONTINUE parameters but the DYD6 segment did not set the EBCM02 field to (A) abort or (C) continue.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD30005E EVNWC ERROR**

**Explanation:** The ZPOOL GENERATION command was entered specifying the CREATE parameter but an EVNWC (wait for event completion) macro found that the EVENTC macro that was set up for creating entry control blocks (ECBs) by pool type has completed with an error.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD30007E UNKNOWN FACS ERROR** *faceid/ordnum*

**Where:**

*faceid*
A character string that identifies the file address compute (FACE) program record type.

*ordnum*
The ordinal number of the FACE record.

**Explanation:** The ZPOOL GENERATION command was entered specifying the CREATE parameter but an unknown error condition was detected by a FACS-type call while trying to retrieve the pool segment table (CY7PL) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command. See *TPF System Macros* and *TPF Application Programming* for more information about the FACS program and the FACS interface.

---

**DYD30008E FINWC D3 RECORD ID -** *recid* **/ ADDRESS -** *faddr*

**Where:**

*faddr*
The file address in the file address reference word (FARW) for the specified D3 level.

*recid*
The record ID in the file address reference word (FARW) for the specified D3 level.

**Explanation:** The ZPOOL GENERATION command was entered specifying the CREATE parameter but the FINWC macro encountered an error trying to find the pool segment table (CY7PL) record using the specified D3 level.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.

2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD30009E DIRECTORY NUMBER** *dirnbr* **GREATER THAN CY7EDN** *direndnbr*

**Where:**

*dirnbr*
The directory number of the record that is being processed.

*direndnbr*
The ending directory number of the pool segment table (CY7PL).

**Explanation:** The ZPOOL GENERATION command was entered specifying the CREATE parameter but the beginning directory number (CY7BDNX in CY7PL) plus the number of directories for each entry control block (ECB) is larger than the pool segment table (CY7PL) ending directory number (CY7EDNX).

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD30010E EVENT NOT FOUND**

**Explanation:** The ZPOOL GENERATION command was entered specifying the CREATE parameter but the EVINC macro tried to increment the count for an event that does not exist.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD30016E UNKNOWN FACS ERROR** *faceid/ordnum*

**Where:**

*faceid*
A character string that identifies the file address compute (FACE) program record type.

*ordnum*
The ordinal number of the FACE record.

**Explanation:** The ZPOOL GENERATION command was entered specifying the CREATE parameter but an error condition was detected by a FACE-type call while trying to retrieve the file address for the new keypoint 9.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD30016E FACE ID INCORRECT** *faceid/ordnum*

**Where:**

*faceid*
A character string that identifies the file address compute (FACE) program record type.

*ordnum*
The ordinal number of the FACE record.

**Explanation:** The ZPOOL GENERATION command was entered specifying the CREATE parameter but an error condition was detected by a FACE-type call while trying to get the file address for the new keypoint 9.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD30016E ORDINAL OUTSIDE RANGE** *begord/endord*

**Where:**

*begord*
The beginning ordinal number of a range of file pool directory records (FPDRs).

*endord*
The ending ordinal number of a range of FPDRs.

**Explanation:** The ZPOOL GENERATION command was entered specifying the CREATE parameter but an error condition relating to the file address compute (FACE) program ordinal number was detected by a FACE-type call while trying to get the file address for the new keypoint 9.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD30018E RCC MISMATCH/WRK_PST -** *wrkpstrcc* **VS CY7PRC =** *cy7itemrcc*

**Where:**

*wrkpstrcc*
The record code check (RCC) of the working item.

*cy7itemrcc*
The record code check of an item in the pool segment table (CY7PL).

**Explanation:** The ZPOOL GENERATION command was entered specifying the CREATE parameter but the working item RCC (WRK_PSTRCC) did not match the pool segment table RCC (CY7PRC$) item.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

**DYD30019E AAA IND -** *wrkpstind*

**Where:**

*wrkpstind*
The working item indicator (WRK_PSTIND).

**Explanation:** The ZPOOL GENERATION command was entered specifying the CREATE parameter but the working item indicator does not indicate an AAA item.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

**DYD30020E BBB IND -** *wrkpstind*

**Where:**

*wrkpstind*
The working item indicator (WRK_PSTIND).

**Explanation:** The ZPOOL GENERATION command was entered specifying the CREATE parameter but the working item indicator does not indicate an BBB item.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

**DYD30022E --- ERROR RETRIEVING KEYPT 9, EBXSW1 -** *ebxsw1val* **---**

**Where:**

*ebxsw1val*
A value in EBXSW1 that shows the type of error.

**Explanation:** The ZPOOL GENERATION command was entered specifying the CREATE parameter but the CYYM segment was unable to retrieve keypoint 9 because of a error (for example, an incorrect data level or keypoint index was used).

**System Action:** The command fails.

**User Response:** Do the following:

1. See the CYYM segment prolog to determine the return code in the EBXSW1 value.
2. Check the return code to determine the cause of the problem.
3. Correct the problem.
4. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

**DYD30023E --- ERROR FILING KEYPT 9, EBXSW1 -** *ebxsw1val* **---**

**Where:**

*ebxsw1val*
A value in EBXSW1 that shows the type of error.

**Explanation:** The ZPOOL GENERATION command was entered specifying the CREATE parameter but the CYYM segment was unable to file keypoint 9 because of a error (for example, an incorrect data level or keypoint index was used).

**System Action:** The command fails.

**User Response:** Do the following:

1. See the CYYM segment prolog to determine the return code in the EBXSW1 value.
2. Check the return code to determine the cause of the problem.
3. Correct the problem.
4. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

**DYD30027E FACE ID INCORRECT** *faceid/ordnum*

**Where:**

*faceid*
A character string that identifies the file address compute (FACE) program record type.

*ordnum*
The ordinal number of the FACE record.

**Explanation:** The ZPOOL GENERATION command was entered specifying the CREATE parameter but a FACE ID error condition was detected by a FACS-type call while trying to retrieve the pool segment table (CY7PL) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command. See *TPF System Macros* and *TPF Application Programming* for more information about the FACS program and the FACS interface.

---

**DYD30037E ORDINAL OUTSIDE RANGE** *begord/endord*

**Where:**

*begord*
The beginning ordinal number of a range of file pool directory records (FPDRs).

*endord*
The ending ordinal number of a range of FPDRs.

**Explanation:** The ZPOOL GENERATION command was entered specifying the CREATE parameter but a FACS-type call returned an incorrect ordinal number while trying to retrieve the pool segment table (CY7PL) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command. See *TPF System Macros* and *TPF Application Programming* for more information about the FACS program and the FACS interface.

---

**DYD40001E - FIND ERROR ON NEW KEYPOINT 9**

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter but a find error condition was detected while trying to retrieve the new keypoint 9.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD40001E - FIND/FILE ERROR ON NEW DIRECTORIES/PDRON**

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter but an error condition was detected by the WAITC macro because a previous FINDC D4 failed to read the new directories.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD40001I ZPOOL GENERATION RECONFIGURE COMPLETED**

**Explanation:** This is the normal response to the ZPOOL GENERATION RECONFIGURE command indicating that pool generation reconfiguration has completed.

**System Action:** The command fails.

**User Response:** Follow established procedures for checking the pool reconfiguration.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD40002E - EVENT NAME NOT FOUND**

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter but the EVINC macro tried to increment the count for an event that does not exist.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD40003E - EVENT TIMED OUT**

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter but the event which was previously set up (to wait for all the different pool type entry control blocks (ECBs) to be posted) completed with error.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD40004E - INCORRECT POOL TYPE PASSED TO RECONFIGURE**

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter but while processing pool type entry control blocks (ECBs), the pool

index is greater than the maximum number of pool sections, or the pool index is zero.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD40005E - DIRECTORY MISMATCH**

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter but the record code check (RCC) or the maximum relative bit index (MBI) of the old directory and the new directory do not match.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD40006E FACE ERROR - INCORRECT RECORD TYPE**

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter but an error condition was detected by a FACE-type call on new keypoint 9, old directory, or new directory records because of an incorrect record type.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**DYD40007E FACE ERROR - ORDINAL TOO HIGH**

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter but an error condition was detected by a FACE-type call on new keypoint 9, old directory, or new directory records because of an out of range ordinal.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**DYD40008T --- ALL PROCESSORS MUST BE IN 1052 STATE ---**

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter but all processors are not in 1052 state.

**System Action:** The command fails.

**User Response:** Do the following:

1. Make sure the command was entered correctly.
2. If necessary, cycle all the processors to 1052 state.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD40009T --- ZPOOL GENERATION LOAD OR CREATE MUST BE RUN FIRST**

**Explanation:**

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter before ZPOOL GENERATION LOAD or ZPOOL GENERATION CREATE was entered.

**System Action:** The command fails.

**User Response:** Do the following:

1. Make sure the command was entered correctly.
2. Make sure the commands are entered in the correct order.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD40010T --- ERROR RETRIEVING KEYPT 9, EBXSW1 - *ebxsw1val* ---**

**Where:**

*ebxsw1val*
A value in EBXSW1 that shows the type of error.

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter but the CYYM segment was unable to retrieve keypoint 9 because of a error (for example, an incorrect data level or keypoint index was used).

**System Action:** The command fails.

**User Response:** Do the following:

1. See the CYYM segment prolog to determine the return code in the EBXSW1 value.
2. Check the return code to determine the cause of the problem.
3. Correct the problem.
4. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD40011T --- ERROR FILING KEYPT 9, EBXSW1 - *ebxsw1val* ---**

**Where:**

*ebxsw1val*
A value in EBXSW1 that shows the type of error.

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter but the CYYM segment was unable to file keypoint 9 because of a error (for example, an incorrect data level or keypoint index was used).

**System Action:** The command fails.

**User Response:** Do the following:

1. See the CYYM segment prolog to determine the return code in the EBXSW1 value.
2. Check the return code to determine the cause of the problem.
3. Correct the problem.
4. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD40012T --- RECONFIGURE WAS ALREADY RUN ---**

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter but pool reconfiguration has already been run.

**System Action:** The function message is rejected.

**User Response:** Determine why another reconfigure is being attempted.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD40022I POOL TYPE *pooltype* FOR *devtype* HAS A DIFFERENCE OF *numaddr* ADDRESSES**

**Where:**

*pooltype*
The type of pool file.

*devtype*
The type of the device.

*numaddr*
The number of addresses that have changed.

**Explanation:** This is the normal response for the ZPOOL GENERATION RECONFIGURE command.

**System Action:** None.

**User Response:** None.

---

**DYD50001T --- FINDC D3 FOR PSTXNEW/*ordnum* ADDRESS - *faddr* ---**

**Where:**

*ordnum*
The ordinal number of the new pool segment table (#PSTXNEW) record.

*faddr*
The file address in the file address reference word (FARW) for the specified D3 level.

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but an error condition was detected by the WAITC macro because a previous FINDC D3 failed to read the new pool segment table.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

See *TPF General Macros* for more information about the WAITC and FINDC macros.

---

**DYD50002T --- FINDC D4 FOR PSTXCUR/*ordnum* ADDRESS - *faddr* ---**

**Where:**

*ordnum*
The ordinal number of the current pool segment table (#PSTXCUR) record.

*faddr*
The file address in the file address reference word (FARW) for the specified D4 level.

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but an error condition was detected by the WAITC macro because a previous FINDC D4 failed to read the current pool segment table record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

See *TPF General Macros* for more information about the WAITC and FINDC macros.

---

**DYD50005T --- FINDC D2 FOR IBMM4/KPT9NEW ADDRESS - *faddr* ---**

**Where:**

*faddr*
The file address in the file address reference word (FARW) for the specified D2 level.

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but an error condition was detected by the WAITC macro because a previous FINDC D2 failed to read the new keypoint 9 pool generation (#KPT9NEW) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

See *TPF General Macros* for more information about the WAITC and FINDC macros.

---

**DYD50006T --- EVNWC ERROR ---**

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but an EVNWC (wait for event completion) goes to the application program error routine after it finds that the EVENTC which was set up for creating entry control blocks (ECBs) by pool type has completed with an error.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD50007T --- EVNWC NOT FOUND ---**

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but the event to create entry control blocks (ECBs) by pool type does not exist.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD50008T --- EVNWC ERROR ---**

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but an EVNWC (wait for event completion) goes to the application program error routine after it finds that the EVENTC which was set up for swapping the directory records has completed with an error.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD50009T --- EVNWC NOT FOUND ---**

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but the event for swapping directory records does not exist.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD50010T --- WAITC ERROR ON DIRECTORY SWAP / OLD DIRECTORY ADDR - *faddr* NEW DIRECTORY ADDR - *faddr***

**Where:**

*faddr*
The file address in the file address reference word (FARW) for the specified D3 or D4 level.

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but an error condition was detected by the WAITC macro because a previous FINDC D3 failed to read the old directory record or because a previous FINDC D4 failed to read the new directory record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD50011T --- WAITC ERROR ON DIRECTORY SWAP / OLD DIRECTORY ADDRESS -** *faddr* **NEW DIRECTORY ADDR -** *faddr*

**Where:**

*faddr*
The file address in the file address reference word (FARW) for the specified D3 or D4 level.

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but an error condition was detected by the WAITC macro because a previous FILNC D3 failed to file the new directory record or because a previous FILNC D4 failed to file the old directory record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

**DYD50012T --- WAITC ERROR ON STPKP / ADDRESS -** *faddr* **---**

**Where:**

*faddr*
The file address in the file address reference word (FARW) for the specified D3 level.

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but an error condition was detected by the WAITC macro because a previous FILNC D3 failed to file the phase 1 captured SONRI directory (#STPKP) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

**DYD50015T --- KEYPT 9 W/HOLD ADDRESS -** *faddr* **---**

**Where:**

*faddr*
The file address in the file address reference word (FARW) for the specified D2 level.

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but a FIWHC D2 (find the new keypoint 9 record) has found an I/O hardware error or other unusual condition.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

**DYD50016T --- POST EVENT WAS NOT FOUND ---**

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but the POST macro could not find an event.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

**DYD50017T --- FACS ERROR FOR** *faceid/ordnum* **---**

**Where:**

*faceid*
A character string that identifies the file address compute (FACE) program record type.

*ordnum*
The ordinal number of the FACE record.

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but an error condition was detected by a FACE-type call while trying to retrieve any of the following:

- Pool segment table
- Keypoint 9
- Pool generation/reallocation record
- Pool directory record
- STPKP record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command. See *TPF System Macros* and *TPF Application Programming* for more information about the FACS program and the FACS interface.

**DYD50018T --- INCORRECT POOL TYPE INDEX -** *poolidx* **---**

**Where:**

*poolidx*
The displacement into the SON file pool keypoint table (CY2KT) in keypoint 9.

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but

the routine that calculates the displacement for pool type in the SON file pool keypoint table (CY2KT) in keypoint 9, found that the pool type indicator is greater that 36.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD50019T --- POOL TYPE INDEX IS 0 ---**

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but the routine that calculates the displacement for pool type in the SON file pool keypoint table (CY2KT) in keypoint 9, found that the pool type indicator is 0.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD50020T --- ALL PROCESSORS MUST BE IN 1052 STATE ---**

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but all processors are not in 1052 state.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Make sure the command is correct.
2. Cycle all processors to 1052 state if necessary.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD50021T --- ABORT COMPLETED ---**

**Explanation:** This is a normal response to the ZPOOL GENERATION command specifying ONLINE ABORT.

**System Action:** None.

**User Response:** If the abort request was because of possible errors, do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD50022T --- ERROR RETRIEVING KEYPT 9, EBXSW1 - *ebxsw1val* ---**

**Where:**

*ebxsw1val*
A value in EBXSW1 that shows the type of error.

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but the CYYM segment was unable to retrieve keypoint 9 because of a error (for example, an incorrect data level or keypoint index was used).

**System Action:** The command fails.

**User Response:** Do the following:

1. See the CYYM segment prolog to determine the return code in the EBXSW1 value.
2. Check the return code to determine the cause of the problem.
3. Correct the problem.
4. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD50023T --- ZPOOL GENERATION LOAD OR CREATE MUST BE RUN FIRST**

**Explanation:**

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter before ZPOOL GENERATION LOAD or ZPOOL GENERATION CREATE was entered.

**System Action:** The command fails.

**User Response:** Do the following:

1. Make sure the command was entered correctly.
2. Make sure the commands are entered in the correct order.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD50024T --- UPDATE ENTRY WAS ALREADY RUN ---**

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE parameter but the pool update function has already been run.

**System Action:** The command is rejected.

**User Response:** Do the following:

- Check the command.
- If you want to rollin the new directories into pool rollin directory (#SONRI) using your previous update, you will have to IPL your TPF system.
- If you do not want to rollin the new directories into the pool rollin directory (#SONRI) using your previous update, enter **ZPOOL GENERATION FALLBACK** to fallback.

---

**DYD50025T --- FILING ERROR ON KEYPT 9 EBXSW1 - *ebxsw1val* ---**

**Where:**

*ebxsw1val*
A value in EBXSW1 that shows the type of error.

**Explanation:** The ZPOOL GENERATION command was entered specifying the UPDATE or FALLBACK parameter but the CYYM segment was unable to file keypoint 9 because of a error (for example, an incorrect data level or keypoint index was used).

**System Action:** The command fails.

**User Response:** Do the following:

1. See the CYYM segment prolog to determine the return code in the EBXSW1 value.
2. Check the return code to determine the cause of the problem.
3. Correct the problem.
4. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD50026T --- UPDATE ENTRY NOT RUN YET ---**

**Explanation:** The ZPOOL GENERATION command was entered specifying the FALLBACK parameter but the update function (ZPOOL GENERATION UPDATE) has not yet been run.

**System Action:** The command is rejected.

**User Response:** Make sure the commands are entered in the correct order.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD60001E --- KEYPOINT 9 INDICATOR NEITHER ABORT OR CONTINUE**

**Explanation:** A ZPOOL GENERATION command was waiting for a response of ZPOOL GENERATION ONLINE ABORT or ZPOOL GENERATION ONLINE CONTINUE but the DYD6 segment did not set the EBCM02 field to (A) abort or (C) continue.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD60002I --- WAITING ON ENTRY, ZPOOL GENERATION ONLINE ABORT OR CONTINUE**

**Explanation:** A ZPOOL GENERATION command is waiting for a response of ZPOOL GENERATION ONLINE ABORT or ZPOOL GENERATION ONLINE CONTINUE.

**System Action:** Continues to wait for a response.

**User Response:** Enter the correct command as the response.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD60003E --- INCORRECT ENTRY ---**

**Explanation:** A ZPOOL GENERATION command was waiting for a response of ZPOOL GENERATION ONLINE ABORT or ZPOOL GENERATION ONLINE CONTINUE but something else was entered.

**System Action:** The command is rejected.

**User Response:** Enter **ZPOOL GENERATION ONLINE ABORT** or **ZPOOL GENERATION ONLINE CONTINUE**.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD60004E --- ENTRY ALREADY MADE ---**

**Explanation:** ZPOOL GENERATION ONLINE CONTINUE or ZPOOL GENERATION ONLINE ABORT was entered but had previously been entered.

**System Action:** The command is rejected.

**User Response:** Determine why the command was entered twice.

See *TPF Operations* for more information about the ZRECP GENERATION command.

---

**DYD60005E --- RETRIEVAL OF KEYPT 9 ---**

**Explanation:** The ZPOOL GENERATION command was entered specifying the ONLINE ABORT or ONLINE CONTINUE parameters but the CYYM segment was unable to retrieve keypoint 9 because of a error (for example, an incorrect data level or keypoint index was used).

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD60006E --- UNFRC OF KEYPT 9 ---**

**Explanation:** The ZPOOL GENERATION command was entered specifying the ONLINE ABORT or ONLINE CONTINUE parameters but the CYYA segment was unable to unhold keypoint 9 because of a error.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD60007E --- FILING OF KEYPT 9 ---**

**Explanation:** The ZPOOL GENERATION command was entered specifying the ONLINE ABORT or ONLINE CONTINUE parameters but the CYYA segment was unable to file keypoint 9 because of a error (for example, an incorrect data level or keypoint index was used).

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80001T INCORRECT ROUTINE CALLED** *routine*

**Where:**

*routine*
The name of the routine that was requested to be run.

**Explanation:** The ZPOOL GENERATION command was entered and the DYD8 segment was passed the name of a routine to run but the routine does not exist in DYD8.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80002T ORDINALS OVERLAPPING END** *endord* **BEGIN** *begord*

**Where:**

*begord*
The beginning ordinal number of a range of file pool directory records (FPDRs).

*endord*
The ending ordinal number of a range of FPDRs.

**Explanation:** The ZPOOL GENERATION command was entered but an ordinal overlap condition has been found.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80003T RCC MISMATCH AAA** *aaarcc* **BBB** *bbbrcc*

**Where:**

*aaarcc*
The record code check

*bbbrcc*
The record code check

**Explanation:** The ZPOOL GENERATION command was entered but the record code check of a file in the deactivation directory does not match the item pointer in the DYDU area.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80004T BEGINNING ORDINALS OUT RANGE AAA** *ordnum* **BBB** *ordnum*

**Where:**

*ordnum*
The ordinal number of the FACE record.

**Explanation:** The ZPOOL GENERATION command was entered but the beginning ordinal of the processing range does not match what is in the deactivation directory.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80005T ENDING ORDINALS OUT RANGE AAA** *ordnum* **BBB** *ordnum*

**Where:**

*ordnum*
The ordinal number of the FACE record.

**Explanation:** The ZPOOL GENERATION command was entered but the ending ordinal of the processing range does not match what is in the deactivation directory.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

**DYD80006T CY7ITEM NUMBER** *cy7itemnbr* **MISMATCH WITH SORT TABLE ITEM NUMBER** *sortitemnbr*

**Where:**

*cy7itemnbr*
The number of a pool segment table (CY7PL) item that is being processed.

*sortitemnbr*
The number of a sort table item that is being processed.

**Explanation:** The ZPOOL GENERATION command was entered but a pool segment table (CY7PL) record does not match the corresponding item in the sorted pool segment table.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80008T ORIGINAL ITEM COUNT** *olditemcnt* **NOW** *newitemcnt*

**Where:**

*olditemcnt*
The number of pool segment table records before the records are sorted.

*newitemcnt*
The number of pool segment table records after the records are sorted.

**Explanation:** The ZPOOL GENERATION command was entered but a bad item count exists following the sort routine.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80009T FACS ERROR ON PSTXNEW** */ordnum* **RC -** *retcode*

**Where:**

*ordnum*
The ordinal number of the file address compute (FACE) program record.

*retcode*
The return code from the FACS-type call.

**Explanation:** The ZPOOL GENERATION command was entered, but an error condition was detected by a FACE-type call on a new pool segment table (#PSTXNEW) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80010T WAITC FAILED ON FILNC D3** *faddr*

**Where:**

*faddr*
The file address in the file address reference word (FARW) for the specified D3 level.

**Explanation:** The ZPOOL GENERATION command was entered, but an error condition was detected by the WAITC macro because a previous FILNC D3 failed to find the new pool segment table (#PSTXNEW) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80011T OVERFLOW NUMBER ITEMS** *nbritems* **LENGTH ITEMS** *lenitems* **GREATER THAN 4 GB**

**Where:**

*nbritems*
The number of items in the sort table.

*lenitems*
The length of all the items in the sort table.

**Explanation:** The ZPOOL GENERATION command was entered but the sort routine failed because of lack of storage.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80012T FACS ERROR ON PSTXNEW** */ordnum* **RC -** *retcode*

**Where:**

*ordnum*
The ordinal number of the file address compute (FACE) program record.

*retcode*
The return code from the FACS-type call.

**Explanation:** The ZPOOL GENERATION command was entered, but an error condition was detected by a FACE-type call on a new pool segment table (#PSTXNEW) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80013T WAITC FAILED ON FILNC D3** *faddr*

**Where:**

*faddr*
The file address in the file address reference word (FARW) for the specified D3 level.

**Explanation:** The ZPOOL GENERATION command was entered, but an error condition was detected by the WAITC macro because a previous FILNC D3 failed to find the new pool segment table (#PSTXNEW) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80014T FACS ERROR ON** *faceid /ordnum* **RC -** *retcode*

**Where:**

*faceid*
A character string that identifies the file address compute (FACE) program record type.

*ordnum*
The ordinal number of the FACE record.

*retcode*
The return code from FACS-type call.

**Explanation:** The ZPOOL GENERATION command was entered, but an error condition was detected by the WAITC macro because a previous FILNC D3 failed to find the new pool segment table (#PSTXNEW) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80015T FINWC D3,DYD8ER15 ERROR ON** *faddr*

**Where:**

*faddr*
The file address in the file address reference word (FARW) for the specified D3 level.

**Explanation:** The ZPOOL GENERATION command was entered, but a find error condition was detected on a new pool segment table (#PSTXNEW) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80016T FACS ERROR ON** *faceid /ordnum* **RC -** *retcode*

**Where:**

*faceid*
A character string that identifies the file address compute (FACE) program record type.

*ordnum*
The ordinal number of the FACE record.

*retcode*
The return code from DYD8.

**Explanation:** The ZPOOL GENERATION command was entered, but an error condition was detected by a FACE-type call on a new pool segment table (#PSTXNEW) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80017T FINWC D3,DYD8ER17 ERROR ON** *faddr*

**Where:**

*faddr*
The file address in the file address reference word (FARW) for the specified D3 level.

**Explanation:** The ZPOOL GENERATION command was entered, but a find error condition was detected on a new pool segment table (#PSTXNEW) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80018T BEGINNING AAA ORDINAL** *ordnum* **AND BBB ORDINAL** *ordnum* **OUT OF RANGE**

**Where:**

*ordnum*
The ordinal number of the FACE record.

**Explanation:** The ZPOOL GENERATION command was entered but the beginning ordinal of the processing range does not match what is in the deactivation directory.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80019T ENDING AAA ORDINAL** *ordnum* **AND BBB ORDINAL** *ordnum* **OUT OF RANGE**

**Where:**

*ordnum*
The ordinal number of the FACE record.

**Explanation:** The ZPOOL GENERATION command was entered but the ending ordinal of the processing range does not match what is in the deactivation directory.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80020T CY7ITEM NUMBER** *cy7itemnbr* **MISMATCH WITH DEACTIVATION TABLE NUMBER** *deactitemnbr*

**Where:**

*cy7itemnbr*
The number of a pool segment table (CY7PL) item that is being processed.

*deactitemnbr*
The number of a deactivation table item that is being processed.

**Explanation:** The ZPOOL GENERATION command was entered but the record code check of a file in the deactivation directory does not match the item pointer in the DYDU area.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80021T WAITC FAILED AFTER FILING PSTXNEW RECORDS**

**Explanation:** The ZPOOL GENERATION command was entered, but an error condition was detected by the WAITC macro after filing new pool segment table (#PSTXNEW) records.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD80022W ZMODE 6, HAS NOT YET BEEN ENTERED BUT FCTB DEFINES 4D6 POOLS. PST RECORDS WILL BE BUILT OMITTING 4D6.**

**Explanation:** ZPOOL GENERATION CREATE was entered to start a pool reallocation on a TPF system with a FACE table (FCTB) that defines 4D6 pools. However, ZMODE 6, which enables the use of 4D6 pools, was not entered.

**System Action:** The reallocation continues; however, the 4D6 pools are ignored.

**User Response:** None.

See *TPF Operations* for more information about the ZPOOL GENERATION and ZMODE commands.

---

**DYD90001T --- INCORRECT ROUTINE CALLED** *routine* **---**

**Where:**

*routine*
The name of the routine that was requested to be run.

**Explanation:** The ZPOOL GENERATION command was entered but the DYD8 segment was passed the name of a routine that does not exist in DYD8.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD90009E UNKNOWN FACS ERROR** *faceid/ordnum*

**Where:**

*faceid*
A character string that identifies the file address compute (FACE) program record type.

*ordnum*
The ordinal number of the FACE record.

**Explanation:** The ZPOOL GENERATION command was entered but an error condition was detected by a FACE-type call on a pool rollin directory (#SONRI) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD90010E FACE ID INCORRECT** *faceid/ordnum*

**Where:**

*faceid*
A character string that identifies the file address compute (FACE) program record type.

*ordnum*
The ordinal number of the FACE record.

**Explanation:** The ZPOOL GENERATION command was entered but an error condition was detected by a FACE-type call on a pool rollin directory (#SONRI) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD90011E ORDINAL OUTSIDE RANGE** *begord/endord*

**Where:**

*begord*
The beginning ordinal number of a range of file pool directory records (FPDRs).

*endord*
The ending ordinal number of a range of FPDRs.

**Explanation:** The ZPOOL GENERATION command was entered but an error condition was detected by a FACE-type call because of an incorrect ordinal number.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**DYD90012E FIWHC DD ERROR / RECORD ID -** *recid* **/ ADDRESS -** *faddr*

**Where:**

*recid*
The record ID in the file address reference word (FARW) for the specified DD level.

*faddr*
The file address in the file address reference word (FARW) for the specified DD level.

**Explanation:** The ZPOOL GENERATION command was entered but a find error condition was detected on the directory record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD90014E WAITC FAILED ON FILUC DD** *faddr*

**Where:**

*faddr*
The file address in the file address reference word (FARW) for the specified DD level.

**Explanation:** The ZPOOL GENERATION command was entered specifying the RECONFIGURE parameter but an error condition was detected by the WAITC macro because a previous FILUC DD failed to file the directory.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZPOOL GENERATION command again.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD90015E ERROR CREATING EVENT NAME FOR IPART BUILD**

**Explanation:** The ZPOOL GENERATION command was entered with the UPDATE or FALLBACK parameter specified, but processing attempted to create an internal event using an event name that already exists.

**System Action:** The IBM pool allocation resource table (IPART) is not built in memory.

**User Response:** Do the following:

1. Determine why the internal event name already exists.
2. Correct the problem.
3. IPL the TPF system to rebuild the IPART in memory.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

---

**DYD90016E IPART BUILD DID NOT COMPLETE IN SPECIFIED TIME LIMIT**

**Explanation:** The ZPOOL GENERATION command was entered with the UPDATE or FALLBACK parameter specified, but the BBLD dynamic load module (DLM) did not signal that the IBM pool allocation resource table (IPART) was rebuilt within the three-minute time limit.

**System Action:** The IPART may not have been successfully rebuilt in memory.

**User Response:** Do the following:

1. Determine if the IPART has been successfully rebuilt in memory.
2. If the IPART has been successfully rebuilt in memory, no additional action is required.
3. If the IPART has not been rebuilt in memory, IPL the TPF system to rebuild it.

See *TPF Operations* for more information about the ZPOOL GENERATION command.

# ECBL

---

**ECBL0001W LONG LIFE AND/OR HUNG ENTRIES DETECTED LONG ENTRIES — *iiii* NEW, *jjjj* TOTAL HUNG ENTRIES — *kkkk* NEW, *llll* TOTAL**

**Where:**

*iiii* The number of long entries detected.

*jjjj* The number of long entries that are new.

*kkkk*
The total number of hung entries detected.

*llll* The number of hung entries that are new.

**Explanation:** The long life ECB detection program detected new long (for example, looping) or hung entries in the TPF system. The ZECBL command may be entered to display information regarding long and hung entries, and to schedule long entries to exit.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZECBL command. See *TPF Main Supervisor Reference* for more information about long life ECB detection and removal.

---

**ECBL0003E INVALID MESSAGE FORMAT**

**Explanation:** The format of the ZECBL command is incorrect.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format of the ZECBL command.
2. Enter the ZECBL command again by using the correct format.

See *TPF Operations* for more information about the ZECBL command. See *TPF Main Supervisor Reference* for more information about long life ECB detection and removal.

---

**ECBL0004E INVALID REQUEST**

**Explanation:** A parameter that is not valid follows the ZECBL command. A valid parameter must be D (display) or E (exit).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZECBL command. See *TPF Main Supervisor Reference* for more information about long life ECB detection and removal.

---

**ECBL0006E SPECIFIED ECB IS NOT IN USE**

**Explanation:** The ECB address following the ZECBL command with the D (display) option is not an active ECB.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZECBL command. See *TPF Main Supervisor Reference* for more information about long life ECB detection and removal.

---

**ECBL0007E INVALID ECB ADDRESS**

**Explanation:** The ECB address following the ZECBL command with the D (display) option is not a valid ECB address.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZECBL command. See *TPF Main Supervisor Reference* for more information about long life ECB detection and removal.

---

**ECBL0010E ECB ALREADY SCHEDULED TO EXIT**

**Explanation:** The ECB address following the ZECBL command with the E (exit) option was already scheduled to exit.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZECBL command. See *TPF Main Supervisor Reference* for more information about long life ECB detection and removal.

**ECBL0014I SUSPENDED ECB AT *xxxxxxxx* CAN NOW BE DISPATCHED**

**Where:**

*xxxxxxxx*
The entry control block (ECB) system virtual memory (SVM) address.

**Explanation:** An ECB previously issued a LODIC or TMSLC macro call.

**System Action:** As a result of this message, the ECB has been reset and is no longer running under the LODIC or TMSLC parameters. It will be dispatched normally.

**User Response:** Use this message carefully. Unsuspending an ECB that uses a large amount of TPF system resources or CPU time can cause system problems.

See *TPF Operations* for more information about the ZECBL command. See *TPF Main Supervisor Reference* for more information about long-life ECB detection and removal.

---

**ECBL0017E ECB CURRENTLY NOT SUSPENDED**

**Explanation:** The entry control block (ECB) address following the ZECBL command with the U (unsuspend) parameter is not an ECB that can be suspended.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZECBL command. See *TPF Main Supervisor Reference* for more information about long-life ECB detection and removal.

---

**ECBL0018E ECB NOT IN USE**

**Explanation:** The entry control block (ECB) address following the ZECBL command with the E (exit) parameter or U (unsuspend) parameter is not currently in use.

**System Action:** No action is taken on that ECB.

**User Response:** None.

See *TPF Operations* for more information about the ZECBL command. See *TPF Main Supervisor Reference* for more information about long-life ECB detection and removal.

---

**ECBL0019I MAY NOT BE ABLE TO EXIT ECB *addr*, ECB MAY STILL HOLD LOCKS.**

**Explanation:** The entry control block (ECB) address following the ZECBL command with the E (EXIT) parameter specified may still hold the locks. The ECB will not exit until all the locks are released.

**System Action:** If the ECB is still active, enter the ZECBL command again.

**User Response:** None.

See *TPF Operations* for more information about the ZECBL command.

---

**ECBL0020I ECB AT *addr* SCHEDULED TO EXIT.**

**Explanation:** This is a normal response to the ZECBL command with the E (EXIT) parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZECBL command.

---

**ECBL0021I *aaaa* ECB'S IN USE, *llll* LOOPING, *hhhh* HUNG**

**Where:**

*aaaa*
The number of active ECBs (includes looping or hung) in decimal format.

*llll* The number of looping ECBs in decimal format.

*hhhh*
The number of hung ECBs in decimal format.

**Explanation:** This is the normal response to the ZECBL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZECBL command. See *TPF Main Supervisor Reference* for more information about long life ECB detection and removal.

---

**ECBL0022I *aaaa* ECB'S IN USE , *ssss* SUSPENDED**

**Where:**

*aaaa*
The number of active entry control blocks (ECBs) (includes suspended ECBs) in decimal format.

*ssss* The number of suspended ECBs in decimal format.

**Explanation:** This is the normal response to the ZECBL command with the D and SUSP parameters specified. The number of ECBs suspended is the number of ECBs that currently reside on the suspend list.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZECBL command. See *TPF Main Supervisor Reference* for more information about long-life ECB detection and removal.

---

**ECBL0024I ECB DATA DISPLAY *stat* ECB AT *addr*, SS—*ss*, SSU—*ssu* PROG *pgm*, AT *paddr*, PSW *psw* I/O COUNT *ii*, HOLD COUNT *hh*, ECB LIFE *ll*, MAX *mm* MINUTES**

**Where:**

*stat* The entry control block (ECB) status, which can be LOOPING, HUNG, SUSPENDED, or ACTIVE

*addr*
The ECB address in hexadecimal.

*ss* The subsystem name.

*ssu* The subsystem user (SSU) name.

*pgm*
The program name (last active program for this entry). If the program name cannot be determined due to an error while processing *paddr*, then the program name will be displayed as four dots.

*paddr*
The program base address in hexadecimal.

*psw* The next sequential instruction (NSI) address from the program status word (PSW) saved in the ECB.

*ii* The ECB input/output (I/O) (or WAIT) count in decimal format.

*hh* The ECB hold counter in decimal format.

*ll* The ECB lifetime to date in minutes in decimal format.

*mm* The maximum permitted ECB life (255 = indefinite) in decimal format.

**Explanation:** This is the normal response to the ZECBL command.

**System Action:** This message will be repeated for all looping entries and all hung entries in the TPF system if the ALL, LOOPING, or HUNG option was specified. This message will be repeated for all suspended entries in the TPF system if the SUSPEND option was specified.

**User Response:** None.

See *TPF Operations* for more information about the ZECBL command. See *TPF Main Supervisor Reference* for more information about long-life ECB detection and removal.

# FCAP

**FCAP0001I CAPTURE STARTED** *ddmmm hhmm*

**Where:**

*ddmmmm*
The date when the capture function started.

*hhmm*
The hour and minute when the capture function started.

**Explanation:** This is the normal response to the ZFCAP STATUS command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFCAP STATUS command, as well as for more information about the capture and restore utility.

**FCAP0004E NOT ACTIVE OR INVALID PARAMETER**

**Explanation:** The input request is rejected, because the main function, which is the capture function or the restore function, is not active or the function keyword in the command is incorrect.

**System Action:** None.

**User Response:** Do one of the following:

- Activate the main function.
- Enter the request again and specify the correct parameter.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0005E KEYPOINT FILE READ ERROR — PROGRAM EXITED**

**Explanation:** The TPF system was unable to read the keypoint record from the disk file.

**System Action:** The requested function was not activated since a main storage copy of the keypoint is not available.

**User Response:** Do the following:

1. Correct the problems.
2. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0006E MOD** *mmm* **ON** *ccud* **TO TAPE ON** *ccud* **— KPT LOST — ABORT**

**Where:**

*mmm*
The module name.

*ccud*
The device address.

**Explanation:** The main storage copy of the working keypoint record was lost.

**System Action:** None.

**User Response:** Do the following:

1. Abort the job.
2. See your coverage programmer for more information.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0007E KEYPOINTS NOT INITIALIZED, ENTER ''CLEAR'' REQUEST**

**Explanation:** A read error occurred while retrieving a keypoint. The keypoints must be initialized.

**System Action:** None.

**User Response:** Enter the ZFCAP CLEAR command.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0008I MOD** *mmm* **ON** *ccud* **TO TAPE ON** *ccud* **— STARTED**

**Where:**

*mmm*
The module name.

*ccud*
The device address.

**Explanation:** This message is the output each time the

capture function or the restore function activate an entry.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0009I MOD *mmm* ON *ccud* TO TAPE ON *ccud* — COMPLETED**

**Where:**

*mmm*
The module name.

*ccud*
The device address.

**Explanation:** This message is the output each time an entry is completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0010I STARTED**

**Explanation:** This message is the output:

- On each successful activation of the input messages to capture all or individual modules
- To restore to all, individual, or selected areas of modules, CAP records, logging records
- To exception recorded records.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0011I COMPLETED**

**Explanation:** This message is issued when the entire capture or restore function is completed.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0012E MOD *mmm* NOT VALID**

**Where:**

*mmm*
The module name.

**Explanation:** An input message containing a specific module or modules was issued and the module number specified is not valid to the TPF system or is not within the range assigned to the subsystem where the function is being activated.

**System Action:** None.

**User Response:** If the function you requested specified multiple modules, activation may occur for the valid modules.

You must decide whether or not the rejected module is required for the function. If the rejected module is required, do the following:

1. Abort the function.
2. Correct the problem.
3. Enter the command again.

**Note:** It may also be valid, in this case, to allow the function to complete and then to repeat the function for the rejected module.

If the function was not started, do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0013E TAPE *cud* INVALID**

**Where:**

*cud* The tape address.

**Note:** This variable may contain unprintable characters if the tape address specified for the ZFCAP command was specified incorrectly.

**Explanation:** The tape device hardware address referenced in this message and specified in the command is not a valid tape device address.

**System Action:** The device is rejected and initialization of the requested function is continued with the remaining parameters, if there are any.

**User Response:** If the required function was not started, do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

If the function was not started, you can add additional tapes by entering the ZFRST TAPE command with the ADD parameter specified.

See *TPF Operations* for more information about the ZFRST TAPE and the ZFCAP commands. See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0014I PROCESSOR *p* RESTART COMPLETE**

**Where:**

*p* The processor ID.

**Explanation:** The restart of the capture or restore function was successful for the processor specified in the message.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0015I ABORTED**

**Explanation:** The abort request for the function in progress completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0016I MOD *mmm* ON *ccud* TO TAPE ON *ccud* — ABORTED**

**Where:**

*mmm*
The module name.

*ccud*
The device address.

**Explanation:** The request for the abort of a specific module completed successfully. This message is also received when the tape, for which a module function is in progress, is deleted.

**System Action:** The module is internally aborted.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0017E MOD *mmm* INVALID OR NOT IN PROGRESS — NO ABORT**

**Where:**

*mmm*
The module address.

**Note:** This variable may contain unprintable characters if the module address specified for the ZFCAP command was specified incorrectly.

**Explanation:** A request for the abort of a module was received and the specified module is not a valid module number or does not have a function in progress at the present time.

**System Action:** None.

**User Response:** If the module number is not valid, do the following:

1. Correct the module number so that it is valid.
2. Enter the abort request again.

If the module is not in progress, there is no reason to abort it.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0018I PROCESSOR *p* PAUSED**

**Explanation:** A pause request completed successfully and the processor specified in the message is now in a paused status. This message applies only to functions using the generic CAP tape.

**System Action:** None.

**User Response:** Enter the correct restart message to activate the function again.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0019I TAPE *yyy* DELETED**

**Where:**

*yyy* The symbolic tape name.

**Explanation:** The tape specified in the message was deleted successfully from the tape device control table (TDCT).

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0020E TAPE *cud* INVALID OR NOT IN TDCT — NOT DELETED**

**Explanation:** A request was made to delete a tape drive from the capture and restore functions, and the indicated device could not be found in the tape device control table (TDCT).

**System Action:** None.

**User Response:** Check the status display for the list of valid drives. If the device address was not valid, enter the command again with the correct address.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0021I TAPE *yyy* ADDED**

**Where:**

*yyy* The symbolic tape name.

**Explanation:** This message indicates that a tape device was added successfully to the tape device control table (TDCT). This message is in response to a capture and restore start or tape add command.

**System Action:** None.

**User Response:** If this is the capture function, a preinitialized tape should be readied on the tape drive prior to entry of the activation message.

If this is the restore function, a CAP tape should be mounted on the device prior to activation.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0022I SEXPT PROCESSING IS ALREADY IN PROGRESS**

**Explanation:** This message indicates that the stop exception recording function is already active in the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0023I LOGGING STARTED — PROCESSOR *p***

**Where:**

*p* The processor ID.

**Explanation:** The record logging function was activated on the processor specified in the message.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0024I LOGGING STOPPED — PROCESSOR *p***

**Where:**

*p* The processor ID.

**Explanation:** The record logging function was ended on the processor specified in the message.

**System Action:** None.

**User Response:** Dismount and label the real-time logging tapes, which will have been rewound and unloaded.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0025I KPT STARTED**

**Explanation:** The keypoint capture function or the keypoint restore function was started.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0026I KPT RESTARTED**

**Explanation:** The keypoint capture function or the keypoint restore function was restarted successfully.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0027I KPT COMPLETE**

**Explanation:** The capture or restore of keypoint records was completed successfully.

**System Action:** Dismount and remove the KPC tape. Then, if this was the capture function, label the tape.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0028W MOD *mmm* ON *ccud* TO TAPE ON *yyy* — STARTED *hhmm* — ACTIVE LONGER THAN EXPECTED**

**Where:**

*mmm*
The module name.

*ccud*
The device address.

*yyy* The symbolic tape name.

*hhmm*
The time (hours and minutes) that the capture or restore of the module began.

**Explanation:** The capture or restore of the module specified in the message started at the time (in hours and minutes) specified in the message is taking longer than expected to complete.

**System Action:** None.

**User Response:** Check the tape specified in the message. If the tape is not moving, then the entry should be aborted by entering a TAPE DEL message or an ABORT message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0031E INVALID PARAMETER OR MISSING DELIMITER**

**Explanation:** The format of the command is not valid.

**System Action:** No action is taken and the program is exited.

**User Response:** Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0032E SEQUENCE ERROR**

**Explanation:** The command is not allowable at this time.

**System Action:** None.

**User Response:** Allow a prior action to complete before entering the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0033E KPT TAPE ERROR — REENTER MSG**

**Explanation:** An irrecoverable tape write error was encountered by the keypoint capture function while trying to write a tape label record or a keypoint record to the KPC tape.

**System Action:** The keypoint capture function is ended.

**User Response:** Do the following:

1. Correct the tape error.
2. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0034E KPT FIND ERROR — REENTER MSG**

**Explanation:** An irrecoverable file read error occurred. This error can occur for any of the following reasons:

- The MCHR data that was passed to CZU1 is incorrect and CZU1 returned with an error indication. Review keypoint X to determine the reason for the error.
- A find error occurred on a keypoint record and while trying to retrieve the processor ID another error occurred.
- A find error occurred when trying to retrieve a tape label record.

**System Action:** The keypoint capture function is ended.

**User Response:** Do the following:

1. Correct the file error.
2. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0035A RESTART REQUIRED**

**Explanation:** After a TPF system IPL or pause of CAP processing, the only valid input message (with the exception of CLEAR or STATUS) is RESTART.

**System Action:** The entry is exited and no action is taken.

**User Response:** Enter the RESTART message to resume processing.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0037E INITIAL XCP/LOG TAPE ERROR**

**Explanation:** If the error occurred while labelling the XCP/LOG tapes as the result of a start request, the function is not started and the program is exited.

If the error occurred as the result of a stop request or when writing a time stamped record, the error is ignored.

**System Action:** None.

**User Response:** When starting a function, correct the error and enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0038I XCP STOPPED — RTA SWITCH INITIATED**

**Explanation:** The message is issued in response to a request to stop exception recording.

**System Action:** None.

**User Response:** Ensure that a standby RTA tape is mounted.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0040I MOD *mmm* ON *ccud* TO TAPE ON *cud* — RESTARTED**

**Where:**

*mmm*
The module name.

*ccud*
The device address.

*cud* The tape address.

**Explanation:** This message is the output for each entry restarted for the capture function or the restore function.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0041I MOD *mmm* ON *ccud* TO TAPE ON *cud* — TIMED OUT**

**Where:**

*mmmm*
The module name.

*ccud*
The device address.

*cud* The tape address.

**Explanation:** This message is issued by the BXAE abort/pause program, which is part of the capture and restore utility, when an entry takes longer than expected to complete.

**System Action:** The referenced entry was exited. If the time out occurs before the first tape is read, the module data is not available and the module name and the device address fields in the message will be blank.

The capture or restore of the selected module may be restarted at a later point in time.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility. See the FCAP0070I message for more information.

**FCAP0042I ABORT IN PROGRESS**

**Explanation:** An abort function was started successfully.

**System Action:** None.

**User Response:** Allow the abort to complete before activating any other functions.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0043I PAUSE IN PROGRESS PROCESSOR *p***

**Explanation:** A pause function was started successfully for the processor specified in the message.

**System Action:** None.

**User Response:** Allow the pause to complete before activating any other functions.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0044I EXCEPTION RECORDING CONTINUING**

**Explanation:** When the capture function completes or is aborted, exception recording is continued.

**System Action:** None.

**User Response:** Determine whether exception recording is still required. If not, enter the command to stop exception recording.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0045A TIME OUT PAUSE CLEANUP**

**Explanation:** Security in the capture and restore utility detected a function in progress for an unacceptable amount of time.

**System Action:** The function is internally paused. Warning messages usually precede this action.

**User Response:** Do the following:

1. Determine the cause of the time out error.
2. Correct the time out error, if possible.
3. Start the capture and restore utility again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0046I KEYPOINT *x* NOT CAPTURED**

**Where:**

*x* The keypoint.

**Explanation:** This is an informational message to notify you that the keypoint specified in the message was bypassed by the capture function. For example, keypoint I is a configuration dependent keypoint that contains CPU serial numbers that should never be restored to a different set of processors. Therefore, the TPF system does not capture this keypoint and sends this message as notification.

**System Action:** Processing is continued.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0047E NO CORE FOR I/O BUFFERS**

**Explanation:** When setting up the input/output (I/O) buffers needed for the capture and restore utility, it was determined that there are not enough core blocks available at the present time.

**System Action:** The capture or restore of the selected module is restarted at a later point in time.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0048I TDCT FULL**

**Explanation:** An attempt was made to add another tape device to the tape device control table (TDCT) but the table has no additional entry space available.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0049I PAUSE IN PROGRESS — ALLOW COMPLETION**

**Explanation:** The input request cannot be processed because there is a pause request currently being processed.

**System Action:** None.

**User Response:** Allow the pause to complete before activating any other processing.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0050A SWITCH TO UTILITY STATE**

**Explanation:** A ZFRST command was entered and the TPF system was not in utility (UTIL) state. The restore function must be run in utility (UTIL)state.

**System Action:** None.

**User Response:** Do the following:

1. Cycle the TPF system to utility (UTIL) state.
2. Enter the ZFRST command again.

See *TPF Database Reference* for more information about the capture and restore utility. See *TPF Operations* for more information about the ZFRST commands.

---

**FCAP0053E NO VALID TAPES SPECIFIED**

**Explanation:** The input request contained tape device parameters and none of the device addresses were found to be valid.

**System Action:** The entry is exited and no processing takes place.

**User Response:** Enter the command again and specify valid module addresses.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0055E FCAP REQUEST INVALID — FRST ACTIVE**

**Explanation:** A capture function was requested while the restore function was active.

**System Action:** None.

**User Response:** Allow the restore function to complete before trying the capture function.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0056E CYCLE TO UTILITY STATE OR HIGHER**

**Explanation:** A ZFCAP command was entered while the TPF system was in 1052 state. The TPF system must be in utility (UTIL) state before entering this command.

**System Action:** None.

**User Response:** Do the following:

1. Cycle the TPF system to utility (UTIL) state.
2. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility. See *TPF Operations* for more information about the ZFCAP commands.

---

**FCAP0057I MOD *mmm* ADDED**

**Where:**

*mmm*
The module name.

**Explanation:** This message is the output in response to a ZFCAP MOD or ZFRST MOD command.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0058A TAPE *yyy* TMNT TIME OUT**

**Where:**

*yyy* The symbolic tape name.

**Explanation:** A tape mount time out occurred while trying to mount a generic CAP tape on the device specified in the message.

**System Action:** None.

**User Response:** Do the following:

1. Display the tape status table to determine the status of the device.
2. Take the necessary corrective action.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0059W [XCP] [LOG] [FCAP] [FRST] ACTIVE — ALLOW COMPLETION**

**Explanation:** This message is issued in response to a ZFCAP CLEAR command when one or all of the programs named in the message are active.

**System Action:** The entry is exited.

**User Response:** Do the following:

1. Wait for the active programs to complete.
2. Enter the ZFCAP CLEAR command with the BP option.

**Note:** This may produce unpredictable results.

See *TPF Database Reference* for more information about the capture and restore utility. See *TPF Operations* for more information about the ZFCAP CLEAR command.

---

**FCAP0060I FCAP/FRST KEYPOINT REINITIALIZED**

**Explanation:** The working copy of the capture and restore utility keypoint was reset successfully to the original values that are contained in the master copy of the keypoint.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0061E MASTER KEYPOINT FIND ERROR**

**Explanation:** An irrecoverable disk error was encountered while trying to read the master keypoint record from file.

**System Action:** The action requested by the command is not performed.

**User Response:** Do the following:

1. Correct the hardware problem.
2. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0062E WORKING KEYPOINT FILE ERROR**

**Explanation:** An irrecoverable disk error was encountered while trying to file the master copy of the capture and restore utility keypoint to the working copy's file location.

**System Action:** The initialization of the working keypoint is not accomplished.

**User Response:** Do the following:

1. Correct the error.
2. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0063E OUT OF SEQUENCE OR INVALID PARAMETER**

**Explanation:** One of the following errors occurred:

- The format of the command is not valid
- The command is not allowed at this time.

**System Action:** The action requested by the command is not performed and the entry is exited.

**User Response:** Do one of the following:

- Correct the parameter that is not valid.
- If the action is out of sequence, allow a prior action to complete before entering the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0064A REMOUNT** *xxx*

**Where:**

*xxx* The tape to be remounted.

**Explanation:** This message displays when the reply to the FCAP0011I message is not correct.

**System Action:** The standby tape that is not valid is dismounted.

**User Response:** Remount the tape on the same channel and control unit as the previous reel.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0065W TDCT EMPTY**

**Explanation:** This message is issued in response to a ZFCAP or ZFRST TAPE DEL command when the last tape in the tape device control table (TDCT) was deleted.

**System Action:** Any active functions cannot complete until the tapes are added.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0066W TAPE** *cud* **IN USE AS** *xxx* **— NOT ADDED**

**Where:**

*cud* The tape address.

**Explanation:** This message is issued during processing of a ZFRST ZFCAP START, ZFCAP TAPE ADD, or ZFCAP TAPE ALT command.

**System Action:** The selected tape drive is not used by the capture and restore utility since it is being used by another program.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0067W NO TAPE DRIVES ON SPECIFIED** *cu*

**Where:**

*cu* The tape control unit.

**Explanation:** A request was made to delete all the tapes on the tape control until specified in the message. The tape device control table (TDCT) does not contain any tapes for that tape control unit.

**System Action:** The entry is exited.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0068I MOD** *mmm* **DUPLICATE — NOT ADDED**

**Where:**

*mmm*
The module name.

**Explanation:** This message is issued in response to a ZFRST or ZFCAP MOD command. The module was already selected for the requested function.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0069I TAPE** *cud* **DUPLICATE — NOT ADDED**

**Where:**

*cud* The tape address.

**Explanation:** This message is issued in response to a ZFCAP, ZFRST START tape, ZFRST ADD tape, or ZFRST ALT command. The tape drive specified in the message is already in use for the capture and restore utility.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0070I MOD** *mmm* **ON** *cud* **TO TAPE** *cud* **IPF — LOST — ABORT**

**Where:**

*mmm*
The module name.

*cud* The tape address.

**Explanation:** The capture or restore function found a zeroed in-progress field. The capture or restore of the module specified in the message is restarted at a later point in time. This message often occurs along with the FCAP0041I message, module timeout, and indicates that the correct cleanup of the module processing occurred.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0072I MOD** *mmm* **ON** *cud* **TO TAPE ON** *cud* **— TAPE ERROR — ABORT**

**Where:**

*mmm*
The module name.

*cud* The tape address.

**Explanation:** During capture processing an irrecoverable tape error occurred.

**System Action:** The program captures the module at a later point in time.

**User Response:** Do one of the following:

- Mount another tape on the tape drive specified in the message.
- Delete the tape specified in the message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0073I** **MOD** *mmm* **ON** *cud* **TO TAPE ON** *cud* **— SWITCHED TO REEL** *n* **ON** *ccud*

**Where:**

*mmm*
The module name.

*cud* The tape address.

*n* The reel.

**Explanation:** During capture processing an end-of-reel was reached before the capture of this module completed. The capture function initiated a tape switch as informed.

**System Action:** None.

**User Response:** Save and label the previous reel of output after the tape switch is completed and the tape is unloaded. This will be indicated by the COTC0087A message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0074W** *mmmmccccchhhhrr* **— RCD NOT CAPTURED**

**Where:**

*mmmmccccchhhhrr*
The record.

**Explanation:** The capture function was unable to capture the record specified in the message because of a hardware error.

**System Action:** A zeroed record is written to the capture tape.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0075W** *mmmmccccchhhhrr* **— TRK NOT CAPTURED**

**Where:**

*mmmmccccchhhhrr*
The track.

**Explanation:** The capture function was unable to capture the track specified in the message because of a hardware failure.

**System Action:** A zeroed track is written to the capture tape.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0076E** **MOD** *mmm* **ON** *cud* **TO TAPE ON** *cud* **— TMNT T/O ABORT**

**Where:**

*mmm*
The module name.

*cud* The tape address.

**Explanation:** The program was unable to mount a generic CAP tape on the drive specified in the message.

**System Action:** The capture function automatically restarts the capture of the module at a later point in time.

**User Response:** Do the following:

1. Determine the cause of the tape mount problem.
2. Take the necessary corrective action.

See *TPF Database Reference* for more information about the capture and restore utility. See the FCAP0058A message for more information.

---

**FCAP0080W** **WARNING MOD** *mmm* **ON** *cud* **— OFF-LINE**

**Where:**

*mmm*
The module name.

*cud* The tape address.

**Explanation:** This message is issued when a module selected to be captured was found to be offline.

**System Action:** None.

**User Response:** Place the module online so that it can be captured.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0081I** **REMAINING MODULES OFF-LINE — FCAP PAUSED**

**Explanation:** During capture processing, all modules that remain to be captured were found to be offline.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Take the necessary corrective action.
3. Enter the ZFCAP RESTART command again.

See *TPF Database Reference* for more information about the capture and restore utility. See *TPF Operations* for more information about the ZFCAP RESTART command.

---

**FCAP0082E** **ECB LEVEL 0 ILLEGAL**

**Explanation:** This message is the output in response to a ZFRST or ZFCAP ALTER LEVEL command to 0.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the problem.

2. Take the necessary corrective action.
3. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0083E ECB LEVEL *n* GREATER THAN ALLOWED**

**Where:**

*n* The ECB level.

**Explanation:** This message is the output in response to a ZFRST or ZFCAP ALTER ECB LEVEL command. The maximum level allowed is defined by an equate in the capture and restore utility keypoint.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Take the necessary corrective action.
3. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility. See *TPF Operations* for more information about the ZFCAP command.

---

**FCAP0084I ECB LEVEL ALTERED TO *n***

**Where:**

*n* The ECB level.

**Explanation:** This message is the output in response to a ZFRST or ZFCAP ALTER ECB LEVEL command.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0111A MOD *mmm* ON *cud* TO TAPE *cud* — NO TAPE AVAIL FOR REEL *n* — MOUNT *xxx***

**Where:**

*mmm*
The module name.

*cud* The tape address.

*n* The reel.

*xxx* The tape to be mounted.

**Explanation:** The capture function was unable to find an available drive for multi-reel output.

**System Action:** None.

**User Response:** Mount the tape specified in the message as a standby output tape. Ensure that the tape drive selected is not available to the capture function (for example, the tape drive is not in the tape device control table (TDCT)).

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0112I TAPE *cud* REPLACED BY TAPE *cud***

**Where:**

*cud* The tape address.

**Explanation:** This message displays when the reply to the FCAP0111I message is not correct.

**System Action:** The new tape drive replaces the old one in the tape device control table (TDCT).

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0117E DUAL TAPE NOT ADDED — CUD'S EQUAL — *cud*–*cud***

**Where:**

*cud* The tape address.

**Explanation:** A capture start or tape add message tried to add a dual tape entry where both tapes specified were the same. The tapes must be on two different drives.

**System Action:** None.

**User Response:** Specify tapes that have different drives.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0119I DUAL TAPE *cud*–*cud* ADDED**

**Where:**

*cud* The tape address.

**Explanation:** A capture start or tape add command caused a dual tape to be made available to the capture function.

**System Action:** None.

**User Response:** Successive reels of multi-reel files should be mounted on these tape drives.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0120I DUAL TAPE *cud*–d*cud* DELETED**

**Where:**

*cud* The tape address.

**Explanation:** A a result of a capture tape delete command, the dual tape defined in this message was made unavailable to the capture function.

**System Action:** Any module restore that is in progress on the deleted drives is aborted and will be restarted later.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0123A MOUNT** *xxx*

**Where:**

*cud* The tape to be mounted.

**Explanation:** A start capture, start record logging, restore logging records, or restore exception records message is issued and the necessary tapes are not mounted.

**System Action:** None.

**User Response:** Mount the requested tape.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0124A RE-INPUT START REQUEST**

**Explanation:** This message is issued in conjunction with the FCAP0123A message.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0126I MOD** *mmm* **IS** *status*

**Where:**

*mmm*
The module name.

*status*
One of the following:

- ABORTED
- COMPLETE
- DEFERRED
- INPROGRESS
- NOT SELECTED
- NOT STARTED.

**Explanation:** This is the normal response to the ZFCAP STATUS command with the MODULE parameter specified to request the status of a specific module.

**System Action:** The status of the specified module is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZFCAP STATUS command. See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0128E DUAL TAPE NOT ADDED — TAPE** *cud* **NOT IN TDCT**

**Explanation:** In a request to make an alternate tape drive available to the capture function, the first tape specified was not an existing capture tape.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0129E DUAL TAPE NOT ADDED — ALT** *cud–cud* **ALREADY EXISTS**

**Where:**

*cud* The tape address.

**Explanation:** A request to make an alternate tape drive available to the capture function specified a drive for which an alternate already exists.

**System Action:** None.

**User Response:** Enter the command again and specify an unused tape drive.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0131E DDCT FILE READ ERROR — PROGRAM EXITED**

**Explanation:** This message is the output when an error occurred while retrieving the disk device control table (DDCT).

**System Action:** None.

**User Response:** Do the following:

1. Pause the capture and restore utility.
2. Determine the cause of the read error.
3. Take the necessary corrective action.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0132W UNABLE TO SYNCHRONIZE EXCEPTION RECORDING**

**Explanation:** When staring the capture function an error occurred when informing the non-participating processors to start exception recording.

**System Action:** None.

**User Response:** Do the following:

1. Abort the request.
2. Start the capture function again.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0133E LOST DDCT**

**Explanation:** A request was made to refresh the core copy of the disk device control table (DDCT) but the core copy is not attached. This error sometimes occurs after an abort or clear request was processed.

**System Action:** The ECB is exited.

**User Response:** Do the following:

1. Pause the capture function.
2. Start the capture function again.

**Note:** If the error was due to an abort or clear, you do not need to take any action. However, if the problem continues, see your system programmer for more information.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0134I PROCESSOR *procid* COMPLETED**

**Where:**

*procid*
The processor ID.

**Explanation:** One of the processors that was participating in the capture detected that there are no additional modules to capture so processing is finished.

**System Action:** The TPF system issues this message as each processor in the TPF complex finishes capturing its last module and there are no additional modules to capture. When all the processors are finished, the TPF system issues the FCAP0011I message to indicate that the entire capture has completed and all the processors are now finished.

**User Response:** Wait for the FCAP0011I message to display, which indicates that the entire capture has completed and all processors are finished.

---

**FCAP0135E DDCT FILE READ ERROR**

**Explanation:** A request was made to delete a utility from the processor ownership table (PROT) and an error was encountered while trying to retrieve the disk device control table (DDCT).

This message follows the OPR-041500 system error.

**System Action:** The function is not completed.

**User Response:** Do the following:

1. Review the system error dump to determine the problem.
2. Take the necessary corrective action.
3. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0136I EXCEPTION RECORDING STARTED**

**Explanation:** All active processors output this message when the capture function is started on another processor.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0137E NO PROT UTIL ENTRY FOR THIS PROCESSOR**

**Explanation:** The PROT utility does not contain the entry required to start the capture and restore utility on this processor.

**System Action:** None.

**User Response:** Assign the FCAP/FRST utility entry for this processor.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0138E PROT FACE ERROR ON ORDINAL *cc***

**Where:**

*cc* The ordinal number.

**Explanation:** An error occurred when the PROT utility or tape record was retrieved from file. The ordinal number indicates which record address was being retrieved.

**System Action:** Processing cannot continue and the entry is exited.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Take the necessary corrective action.
3. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0139E INVALID MOD DEVICE TYPE**

**Explanation:** When using the device type table in the capture and restore utility keypoint record, a disk device type that is not valid was found. This indicates that the keypoint record may be corrupted.

**System Action:** None.

**User Response:** See your coverage programmer for more information. It may be necessary to correct the problem before any further capture and restore utility processing can occur.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0140E VALUE OF I/O DELAY TIME FACTOR ALTERED TO *xxxx***

**Where:**

*xxxx*
The content of the BXIOTIME field.

**Explanation:** This message displays the new contents of the BXIOTIME field within the issuing processor's capture keypoint. This message is issued in response to a ZFCAP IOTIME command.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0141A MOUNT *xxx* FOR PROCESSOR *p***

**Where:**

*xxx* The XCP/LOG tape name.

*p* The processor ID.

**Explanation:** The XCP/LOG tape specified is not mounted on the processor specified in the message.

**System Action:** None.

**User Response:** Do the following:

1. Mount the tape.
2. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0142W TAPE DEVICE *cud* NOT ASSIGNED TO PARTICIPATING PROC**

**Where:**

*cud* The tape address.

**Explanation:** The tape device specified in an FCAP/FRST start message is not configured to any participating processor.

**System Action:** The entry is exited.

**User Response:** Do the following:

1. Configure the device.
2. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0144E CYCLE PROC *p* TO UTIL STATE OR HIGHER**

**Where:**

*p* The processor ID.

**Explanation:** The participating processor specified in the message is not in utility (UTIL) state or a higher state, which is required for the capture function to begin.

**System Action:** The entry is exited.

**User Response:** Do the following:

1. Cycle the processor to utility (UTIL) state or a higher state.
2. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0145E NO VALID TAPE DEVICE FOR PROC *p***

**Where:**

*p* The processor ID.

**Explanation:** The FCAP/FRST START request does not contain at least one tape device for the participating processor specified in the message.

**System Action:** None.

**User Response:** Do the following:

1. Configure a tape device for the processor specified in the message.
2. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0146E XCP SYNC TIME OUT OCCURRED — CAPTURE ABORTED**

**Explanation:** When starting the capture function, an active processor did not start exception recording within a given time period.

**System Action:** The capture activity is cleared from the keypoint and the entry is exited.

**User Response:** Do the following:

1. Determine the cause of the problem. Either a START message did not reach the affected processor or an error occurred before exception recording started.
2. Take the necessary corrective action.
3. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0147E CTK* RETRIEVAL ERROR FOR PROC *p***

**Explanation:** A keypoint find error occurred during keypoint capture.

**System Action:** The keypoint capture function is aborted.

**User Response:** Do the following:

1. Correct the designated keypoint.
2. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0148E PROT FIND ERROR ADDR *address***

**Where:**

*address*
The address of the PROT record.

**Explanation:** A find error occurred while retrieving the PROT record at the address specified in the message.

**System Action:** No further processing is possible and the entry is exited.

**User Response:** Do the following:

1. Correct the PROT record.
2. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0149I XCP/LOG TAPE *xxx* STILL ACTIVE ON SUBSYSTEM *ssss***

**Where:**

*xxx* The XCP/LOG tape name.

*ssss* The subsystem name.

**Explanation:** This message indicates that the LOG/XCP tape

is still active on another subsystem after a STOP LOG or XCP function is issued.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0152E MORE MOD NUMBERS EXPECTED**

**Explanation:** A delimiter (/) was found in a capture and restore utility ABORT MOD command but no module numbers were found after the delimiter.

**System Action:** None.

**User Response:** Enter the command again and specify the correct syntax.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0153I FOR CPU-*n* DASDCU-*n* DASDCH-*n* TAPECH-*n* TAPECU-*n***

**Where:**

*n* The value for the CPU, DASDCU, DASDCH, TAPECH, TAPECU.

**Explanation:** This is the display from the ZFCAP DISP command. The values displayed are for DASDCU, DASDCH, TAPECH, and TAPECU.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0154E INVALID CPUID**

**Explanation:** A CPU ID that is not valid was specified for the ZFCAP CHANGE/DISP command.

**System Action:** None.

**User Response:** Specify the correct CPU ID.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0155I COMPLETED**

**Explanation:** This message signals completion of a ZFCAP DISPLAY command. It only appears when the CPU parameter is used.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0156E TAPECH/DASDCH/DASDCU/TAPECU CANNOT BE CHANGED TO ZERO**

**Explanation:** Do not set TAPECH, DASDCH, DASDCU, or TAPECU to 0.

**System Action:** None.

**User Response:** Specify the correct nonzero value.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0157E TAPECH/DASDCH/DASDCU/TAPECU MUST BE LESS THAN 256**

**Explanation:** Do not set TAPECH, DASDCH, or TAPECU to a value greater than 255.

**System Action:** None.

**User Response:** Specify a valid value for the parameters being changed.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0158E MAY ENTER ALL OR CPU– BUT NOT BOTH.**

**Explanation:** A ZFCAP CHANGE command was entered with both the ALL and CPU-C options specified.

**System Action:** None.

**User Response:** Specify the ALL parameter or the CPU-C parameter, but not both or neither.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0159W NO VALUE ENTERED – KEYPOINT UNCHANGED.**

**Explanation:** A ZFCAP CHANGE command was entered without any values to be changed.

**System Action:** None.

**User Response:** When entering the ZFCAP CHANGE command, be sure to specify the values to be changed.

See *TPF Operations* for more inforomation about the ZFCAP CHANGE command. See *TPF Database Reference* for more information about the capture and restore utility.

---

**FCAP0160E CHANGE DASDCU FUNCTION UNAVAILABLE AT THIS TIME, NO CHANGES WERE MADE TO THE KEYPOINT.**

**Explanation:** A ZFCAP CHANGE DASDCU command was entered. Currently, the DASDCU value cannot be changed.

**System Action:** None.

**User Response:** Enter the ZFCAP CHANGE command again without the DASDCU parameter.

See *TPF Operations* for more information abou the ZFCAP CHANGE functional messag. See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0161E DUAL TAPES MUST BE OF THE SAME DEVICE TYPE, DUAL TAPE *cud-cud* NOT ADDED**

**Where:**

*cud* The tape address.

**Explanation:** A dual tape was added to the TDCT and both tapes were not of the same device type.

**System Action:** None.

**User Response:** When entering dual tapes make sure both tapes belong to the same device type.

See *TPF Database Reference* for more information about the capture and restore utility.

**FCAP0162W TAPE *tape* DELETED UNABLE TO SENSE**

**Where:**

*tape*
The tape name.

**Explanation:** A tape was deleted from the TDCT because the capture function was unable to sense it.

**System Action:** None.

**User Response:** Check the tape drive. If you make corrections to the tape drive, put it back into the TDCT by entering the ZFCAP TAPE command with the ADD parameter specified.

See *TPF Database Reference* for more information about the ZFCAP TAPE command.

**FCAP0163I CAPTURE MODULE STATUS**

**Explanation:** This is a normal response to the ZFCAP STATUS command with the MODULE parameter specified.

**System Action:** A list of modules in the requested status is displayed. If the ALL value for the MODULE parameter was specified, status information for all modules is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZFCAP STATUS command. See *TPF Database Reference* for more information about the capture and restore utility.

# FDNT–FMNT

**FDNT0001I GENERAL FILE DATA SET *num* DISMOUNTED FROM *addr***

**Where:**

*num*
The two digit data set number.

*addr*
The address of the device from which the data set is dismounted.

**Explanation:** The general file data set specified in the message was dismounted successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFDNT command.

**FDNT0011E DATA SET *num* NOT ASSIGNED TO SYSTEM**

**Where:**

*num*
The two digit data set number.

**Explanation:** The data set number specified in the message is not within the legal range defined for general file data set numbers.

**System Action:** The command is rejected and the ECB is exited.

**User Response:** Do the following:

1. Determine the correct data set number.
2. Enter the command again and specify the correct data set number.

See *TPF Operations* for more information about the ZFDNT command.

**FDNT0021E I/O ERROR READING GENERAL FILE CONTROL RECORD**

**Explanation:** An error was encountered while trying to access the general file control record.

**System Action:** None.

**User Response:** None.

**FDNT0022E DATA SET *num* NOT MOUNTED IN THIS PROCESSOR**

**Where:**

*num*
The two digit data set number.

**Explanation:** The data set specified in the message cannot be dismounted because it is not mounted.

**System Action:** The request is ignored and the ECB exits.

**User Response:** None.

See *TPF Operations* for more information about the ZFDNT command.

**FDNT0024E FACE ERROR — INVALID RECORD TYPE**

**Explanation:** A file address compute (FACE) program error is returned on the computation of the general file control record.

**System Action:** None.

**User Response:** None.

**FDNT0025E FACE ERROR — ORDINAL NUMBER OUT OF RANGE**

**Explanation:** A file address compute (FACE) program error was returned on the computation of the general file control record.

**System Action:** None.

**User Response:** None.

**FDNT0027E GENERAL FILE RESTART HAS NOT COMPLETED.**

**Segment Reference:** CVTT

**Explanation:** A ZFMNT command was entered but the TPF system has not completed general file restart.

**System Action:** The ZFMNT command is rejected.

**User Response:** Do the following:

1. Wait until the TPF system completes general file restart and is in 1052 state or higher.
2. Enter the ZFMNT command again.

See *TPF Operations* for more information about the ZFMNT command.

**FECB0001E ECB ADDRESS ENTERED WAS NOT VALID**

**Explanation:** The ZFECB command was entered with an entry control block (ECB) address that was not valid.

**System Action:** The ZFECB command was rejected.

**User Response:** Do the following:

1. Verify the system virtual address (SVA) ECB address.
2. Enter the ZFECB command again specifying a valid ECB address.

See *TPF Operations* for more information about the ZFECB command.

**FECB0002E ERROR RETRIEVING PROGRAM RECORD CDEP**

**Explanation:** The CDE0 real-time program was unable to retrieve the CDEP program record successfully.

**System Action:** The ZFECB command was rejected.

**User Response:** Do the following:

1. Verify that the CDEP program record was allocated and loaded correctly.
2. See your system programmer for more information.

See *TPF Operations* for more information about the ZFECB command.

**FECB0003I UNABLE TO FIND STATE CHANGE ECB**

**Explanation:** The ZFECB command was entered at a time when there was no state change entry control block (ECB) active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFECB command.

**FECB0004I NO ACTIVE ECBS FOUND MATCHING SEARCH CRITERIA**

**Explanation:** The ZFECB command was entered, but no active entry control blocks (ECBS) were found that were at or above the time limit specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFECB command.

**FECB0005I INPUT SVC MACRO NAME WAS NOT FOUND**

**Explanation:** No active entry control blocks (ECBs) were found that had last issued the input supervisor call (SVC) macro name.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFECB command.

**FECB0006I ACTIVE ECB DISPLAY**

**Explanation:** This is a normal response to the ZFECB active entry control block (ECB) display command. This message is followed by a display of all the ECBs in the TPF system that meet the criteria of the parameters specified. The I-stream will be displayed as a decimal number.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFECB command and for an example of the informational display.

**FECB0008I FORMATTED ECB DISPLAY**

**Explanation:** This is a normal response to the ZFECB command. This message is followed by either a display of the entry control block (ECB) whose address was specified in the command or a display of the state change ECB. The I-stream will be displayed as a decimal number.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFECB command and for an example of the informational display.

**FILE0001I START OF DISPLAY FROM *cmd***

**Where:**

*cmd*
The request processed by a ZFILE command.

**Explanation:** This is a normal response to a ZFILE command when the request generates normal output for the standard output (stdout) stream. This message is followed by a display of the normal output.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFILE commands and for examples of the displays.

---

**FILE0002I START OF ERROR DISPLAY FROM** *cmd*

**Where:**

*cmd*
The request processed by a ZFILE command.

**Explanation:** This is a normal response to a ZFILE command when the request generates error output for the standard error (stderr) stream. This message is followed by a display of the error output.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFILE commands and for examples of the displays.

---

**FILE0003I** *cmd* **COMPLETED SUCCESSFULLY. NO OUTPUT TO DISPLAY**

**Where:**

*cmd*
The request processed by a ZFILE command.

**Explanation:** This is a normal response to a ZFILE command when the request was completed successfully and did not generate any specific output for either the standard output (stdout) or standard error (stderr) stream.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFILE commands.

---

**FILE0005W FILE SYSTEM RUNNING LOW OF INODE AND FLOCK RECORDS**

**Explanation:** The file system ran low of the #INODE and #FLOCK fixed file records that were needed to create new files because a high percentage of the #INODE and #FLOCK fixed file records were in use for existing files.

**System Action:** The file system cannot create new files when it runs out of available #INODE and #FLOCK fixed file records. When this occurs, the TPF system C functions that normally create files fail with the value of the errno external variable set to ENOSPC.

**User Response:** Do the following:

1. Load a new file address compute program (FACE) table with additional #INODE and #FLOCK fixed file records.
2. Enter the ZFINT command with the ADD parameter specified to initialize the new fixed file records.

See *TPF Operations* for more information about the ZFINT command. See *TPF System Generation* for more information about the FACE table.

---

**FILE0050W SAVED FILE SYSTEM STATE NOT REESTABLISHED**

**Explanation:** A ZFILE command was entered, but the environment variables for the file system may not be set correctly. For example, assume you entered a ZFILE cd command to change your current working directory and then entered a subsequent ZFILE command, expecting the second request to process in the new current directory. This message occurs if your new environment (the directory to which you just changed) cannot be established for the new ZFILE command request.

Environment variables for ZFILE commands are saved in the /.tpfZfileState hidden directory. There is a state file for each computer room agent set (CRAS) terminal that issues ZFILE commands. The name of the file is a combination of the line number, interchange address, and terminal address (LNIATA) of the terminal and the processor identifier (ID) on which the ZFILE command was processed; for example, 000100B. The files in the /.tpfZfileState directory are not hidden. ZFILE processing uses the environment variables to restore the environment for each CRAS terminal to the previous state, such as the current working directory. You can edit this file to modify or add ZFILE environment variable values.

**System Action:** The ZFILE command request continues. Any results based on the environment variables may not be reliable.

**User Response:** Do the following:

1. Examine the state file for your CRAS terminal in the /.tpfZfileState directory to ensure that the environment variable statements are correct. You can use the ZFILE cat command to display the contents of the file.
2. Correct any problems with the environment variable statements, if possible.
3. If you are able to correct the environment variable statements, go to step 4. If you are unable to correct the statements, enter the ZFILE rm command and specify the full path name to delete the state file for your CRAS terminal. When the state file is deleted, the environment variables are reset to the default settings. Go to step 4.
4. Enter the ZFILE command again.

See *TPF Operations* for more information about the ZFILE commands.

---

**FILE0096E FILE SYSTEM INOPERATIVE**

**Explanation:** A ZFILE command was entered during a period of time when the file system was inactive. No #INODE fixed file records appear to be available. This can occur if you enter a ZFILE command before the file system is fully initialized.

**System Action:** The ZFILE command is rejected.

**User Response:** Wait for the file system to complete initialization and enter the ZFILE command again.

See *TPF Operations* for more information about the ZFILE commands.

**FILE0097E COMMAND NOT FOUND**

**Explanation:** A ZFILE command was entered that is not supported.

**System Action:** The ZFILE command is rejected.

**User Response:** Do the following:

1. Enter **ZFILE HELP** to display the supported ZFILE commands.
2. Enter a ZFILE command that is supported.

See *TPF Operations* for more information about the ZFILE commands.

**FILE0098E FILE SYSTEM MUST BE INITIALIZED**

**Explanation:** A ZFILE command was entered in a TPF subsystem where the file system is not initialized.

**System Action:** The ZFILE command is rejected.

**User Response:** Do the following:

1. Enter the ZFINT command to initialize the file system in the TPF subsystem.
2. Enter the ZFILE command again.

See *TPF Operations* for more information about the ZFILE and ZFINT commands.

**FILE0099E SYSTEM MUST BE IN CRAS STATE OR ABOVE**

**Explanation:** A ZFILE command was entered in a TPF subsystem below CRAS state.

**System Action:** The ZFILE command is rejected.

**User Response:** Do the following:

1. Cycle the TPF subsystem to CRAS state or above.
2. Enter the ZFILE command again.

See *TPF Operations* for more information about the ZFILE commands.

**FILT0001I DISPLAY PACKET FILTERING RULES**

**Explanation:** This is the normal response to the ZFILT command with the DISPLAY parameter specified.

**System Action:** The contents of the packet filtering rules table are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZFILT command and an example of the informational display. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP packet filtering firewall support.

**FILT0002I PACKET FILTERING RULES REFRESHED**

**Explanation:** This is the normal response to the ZFILT command with the REFRESH parameter specified.

**System Action:** The packet filtering rules table is refreshed to core storage.

**User Response:** None.

See *TPF Operations* for more information about the ZFILT command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP packet filtering firewall support.

**FILT0003E REJECTED, SYSTEM IS IN RESTART**

**Explanation:** The ZFILT command was entered, but the TPF system is in restart mode.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait for the TPF system to reach 1052 state.
2. Enter the ZFILT command again.

See *TPF Operations* for more information about the ZFILT command.

**FILT0004E REJECTED, TCP/IP NATIVE STACK SUPPORT NOT DEFINED**

**Explanation:** The ZFILT command was entered, but TCP/IP native stack support is not defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Code the TCP/IP native stack support parameters in the SNAKEY macro.
2. Reassemble keypoint record 2 (CTK2) against the SNAKEY macro.
3. Reload CTK2.
4. IPL the TPF system.
5. Enter the ZFILT command again.

See *TPF Operations* for more information about the ZFILT command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the SNAKEY parameters that are required for TCP/IP native stack support. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

**FILT0006E REJECTED, FILE /etc/iprules.txt DOES NOT EXIST**

**Explanation:** The ZFILT command was entered with the REFRESH parameter specified, but the `/etc/iprules.txt` file does not exist.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Create the `/etc/iprules.txt` file on the TPF file system.
2. Enter the ZFILT command again with the REFRESH parameter specified.

See *TPF Operations* for more information about the ZFILT command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP packet filtering firewall support and the `/etc/iprules.txt` file.

**FILT0007E ERROR OPENING FILE /etc/iprules.txt, ERRNO** *description*

**Where:**

*description*
The `errno` function value.

**Explanation:** The ZFILT command was entered with the REFRESH parameter specified, but an error occurred when opening the `/etc/iprules.txt` file.

**System Action:** The command is rejected.

**User Response:** Look in `errno.h` to see a description of the error and do one of the following:

- If the error indicates a file access permission error, enter **ZFILE ls -l /etc/iprules.txt** to display the current file access permission settings and do one of the following:
  - If the file has read permission set, see your system programmer.
  - If the file does not have read permission set, enter the ZFILE chmod command to set the read permission for the `/etc/iprules.txt` file.
- If the error indicates something other than a file access permission error, see your system programmer.

See *TPF Operations* for more information about the ZFILT, ZFILE ls, and ZFILE chmod commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP packet filtering firewall support.

**FILT0008E TOO MANY RULES DEFINED IN FILE /etc/iprules.txt**

**Explanation:** The ZFILT command was entered with the REFRESH parameter specified, but there are too many rules defined in the `/etc/iprules.txt` file. You can have a maximum of 120 rules defined for TCP/IP packet filtering firewall support.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Code the `/etc/iprules.txt` file again with a valid number of rules defined.
2. Enter the ZFILT command again with the REFRESH parameter specified.

See *TPF Operations* for more information about the ZFILT command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP packet filtering firewall support.

**FILT0009E ERROR ON LINE NUMBER** *num***, ERROR NUMBER** *error*

**Where:**

*num*
The line number in the `/etc/iprules.txt` file that contains the error.

*error*
One of the following error numbers:

**1** An error occurred with the ACTION parameter.

**2** An error occurred with the IP address specified with the FROM parameter.

**3** An error occurred with the subnet mask specified with the FROM parameter.

**4** An error occurred with the PORT parameter.

**5** An error occurred with the PROTO parameter.

**6** No action was specified for a specific rule.

**7** An error occurred with the ICMPTYPE parameter.

**8** An error occurred with the DEFAULT parameter.

**9** The format of the rule is not valid.

**10** A keyword was specified that is not valid.

**11** An error occurred when reading this line from the file.

**12** The specified line is too long.

**Explanation:** The ZFILT command was entered with the REFRESH parameter specified, but there was a syntax error in one of the rules in the `/etc/iprules.txt` file.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Correct the error in the `/etc/iprules.txt` file.
2. Enter the ZFILT command again with the REFRESH parameter specified.

See *TPF Operations* for more information about the ZFILT command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP packet filtering firewall support.

**FILT0010E MALLOC ERROR, CANNOT DISPLAY IP PACKET FILTERING RULES TABLE**

**Explanation:** The ZFILT command was entered with the DISPLAY parameter specified, but there is not enough storage in the TPF system to display the packet filtering rules table.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine why there is not enough storage in the TPF system.
2. Correct the problem.
3. Enter the ZFILT command again with the DISPLAY parameter specified.

See *TPF Operations* for more information about the ZFILT command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP packet filtering firewall support.

**FINT0001I FILE SYSTEM INITIALIZATION PENDING**

**Explanation:** This is the normal response for the ZFINT command with the ON parameter specified. This normal response indicates that the file system will be initialized when the TPF system reaches NORM state at the next cycle.

**System Action:** The file system is initialized if the TPF system cycles to NORM state without an intervening IPL or

without a ZFINT command entered with the OFF parameter specified.

**User Response:** None.

See *TPF Operations* for more information about the ZFINT command.

---

**FINT0002I FILE SYSTEM INITIALIZATION NOT PENDING**

**Explanation:** This is the normal response to the ZFINT command with the OFF parameter specified. This normal response could be a result of one of the following:

- The file system is not scheduled to be initialized.
- The file system may be already initialized.
- The file system may not be already initialized.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFINT command.

---

**FINT0005E NOT ENOUGH INODE AND FLOCK RECORDS ARE AVAILABLE. ONLY *number* ARE AVAILABLE**

**Where:**

*number*
The number of #INODE and #FLOCK fixed file records that are available for initialization.

**Explanation:** The ZFINT command was entered with the ADD parameter specified to add more #INODE and #FLOCK fixed file records to the file system than were available for initialization.

**System Action:** The ZFINT command was rejected.

**User Response:** Do the following:

1. Load a new file address compute program (FACE) table with additional #INODE and #FLOCK fixed file records.
2. Enter the ZFINT command with the ADD parameter specified to initialize additional #INODE and #FLOCK fixed file records.

See *TPF Operations* for more information about the ZFINT command. See *TPF System Generation* for information about the FACE table.

---

**FINT0006I INODE AND FLOCK RECORDS ADDED TO THE SYSTEM**

**Explanation:** This is the normal response to the ZFINT command with the ADD parameter specified.

**System Action:** The #INODE and #FLOCK fixed file records were added to the file system successfully.

**User Response:** None.

---

**FINT0007I NO INODES ADDED TO THE SYSTEM**

**Explanation:** This is the normal response to the ZFINT command with the ADD parameter specified. No #INODE or #FLOCK fixed file records will be added to the file system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFINT command.

---

**FINT0008I ONLY *i* OF THE INODE AND FLOCK RECORDS CAN BE USED BECAUSE OF TOO FEW IZERO RECORDS**

**Where:**

*i* The number of #INODE and #FLOCK fixed file records.

**Explanation:** Not all of the requested #INODE and #FLOCK fixed file records can be added because there are not enough #IZERO fixed file records.

**System Action:** None.

**User Response:** Do the following:

1. Load a new file address compute program (FACE) table that contains additional #IZERO fixed file records in order to maximize the use of all the #INODE fixed file records.
2. Initialize the file system using the ZFINT command with the ON parameter specified.

See *TPF Operations* for more information about the ZFINT command.

---

**FINT0009I NO INODE OR FLOCK RECORDS ADDED. THERE ARE NOT ENOUGH REQUESTED TO FIT INTO 1 IZERO RECORD.**

**Explanation:** The minimum of 1000 records must be added to the TPF system at one time.

**System Action:** No records were added to the TPF system.

**User Response:** Enter the ZFINT command again (with the ADD parameter specified) with at least the minimum of 1000 records.

See *TPF Operations* for more information about the ZFINT command.

---

**FINT0010I x INODE AND FLOCK RECORDS ADDED TO THE SYSTEM**

**Where:**

*x* The number of #INODE and #FLOCK fixed file records.

**Explanation:** A ZFINT command with the ADD parameter specified has successfully added *x* #INODE and #FLOCK fixed file records to the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFINT command.

**FINT0011I** ***i*** **OF** ***j*** **INODE AND FLOCK AND** ***m*** **OF** ***n*** **IZERO RECORDS ARE INITIALIZED**

**Where:**

*i* The number of #INODE and #FLOCK fixed file records that were added to the TPF system.

*j* The total number of #INODE and # FLOCK fixed file records.

*m* The number of #IZERO fixed file records that were added to the TPF system.

*n* The total number of #IZERO fixed file records.

**Explanation:** A ZFINT command with the ADD parameter specified has successfully added *i* #INODE and #FLOCK fixed file records to the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFINT command.

---

**FINT0012I FILE SYSTEM NOT INITIALIZED**

**Explanation:** A ZFINT command with the ADD parameter specified was entered but the file system was not initialized.

**System Action:** None.

**User Response:** Enter the ZFINT command with the ON parameter specified and then cycle the TPF system to NORM state.

See *TPF Operations* for more information about the ZFINT command.

---

**FINT0014E ERROR CREATING FILE SYSTEM** ***name*** **CACHE**

**Where:**

*name*
Either directory or i-node.

**Explanation:** This is the normal response to the ZFINT command with the DCACHE and ICACHE parameters specified when there are not enough system heap resources available.

**System Action:** Processing continues without the specified cache.

**User Response:** Make sure there are enough system heap resources available for the cache size being specified.

See *TPF Operations* for more information about the ZFINT command. See *TPF System Generation* for more information about using the CORREQ macro to verify and define system heap storage.

---

**FINT0015I FILE SYSTEM** ***name*** **CACHE CREATED**

**Where:**

*name*
Either directory or i-node.

**Explanation:** This is the normal response to the ZFINT command with the DCACHE or ICACHE parameter specified if the specified cache did not already exist.

**System Action:** The specified number of directory or i-node cache entries has been set in #IZERO fixed file record ordinal 0 of the file system and the cache has been created.

**User Response:** None.

See *TPF Operations* for more information about the ZFINT command.

---

**FINT0016I FILE SYSTEM** ***name*** **CACHE SIZE CHANGED**

**Where:**

*name*
Either directory or i-node.

**Explanation:** This is the normal response to the ZFINT command with the DCACHE or ICACHE parameter specified if the specified cache already exists.

**System Action:** The specified number of directory or i-node cache entries has been set in #IZERO fixed file record ordinal 0 of the file system for use on the next IPL.

**User Response:** None.

See *TPF Operations* for more information about the ZFINT command.

---

**FINT0017I FILE SYSTEM CACHE SIZE: DIRECTORY CACHE** ***xxxxxx*** **INODE CACHE** ***xxxxxx***

**Where:**

*xxxxxx*
The size of the cache in number of entries. This value is retrieved from #IZERO fixed file record ordinal 0. Only the #IZERO fixed file record of the basic subsystem (BSS) will contain a valid value.

**Explanation:** This is the normal response to the ZFINT command with the USAGE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFINT command.

---

**FINT0018I FILE SYSTEM** ***name*** **CACHE DELETED**

**Where:**

*name*
Either directory or i-node.

**Explanation:** This is the normal response to the ZFINT command with the DCACHE or ICACHE parameter specified when a size of 0 is specified and the specified cache already exists.

**System Action:** The number of directory or i-node cache entries has been set to zero in #IZERO fixed file record ordinal 0 of the file system and the active cache has been released.

**User Response:** None.

See *TPF Operations* for more information about the ZFINT command.

---

**FINT0019E ZFINT *name* ONLY VALID FROM THE BSS**

**Where:**

*name*
Either DCACHE or ICACHE.

**Explanation:** The ZFINT command with the DCACHE or ICACHE parameter specified is valid only on the basic subsystem (BSS) because it is the only record the system will read for allocating the specified cache for the entire TPF system.

**System Action:** The request is ignored and the entry control block (ECB) exits without any action taken.

**User Response:** Enter the ZFINT command again and specify the DCACHE or ICACHE parameter on the BSS.

See *TPF Operations* for more information about the ZFINT command.

---

**FINT0020I OLD SIZE EQUALS NEW SIZE, NO CHANGE MADE**

**Explanation:** The cache size designated for the ZFINT command with the DCACHE or ICACHE parameter specified is the same as the current size.

**System Action:** No cache size change has been made.

**User Response:** Enter the ZFINT command again and specify a different cache size for the DCACHE or ICACHE parameter.

See *TPF Operations* for more information about the ZFINT command.

---

**FKPA0001A INSUFFICIENT CORE FOR WORKING STORAGE TOTAL CORE AVAILABLE = *num_avail* TOTAL CORE REQUIRED = *num_req***

**Where:**

*num_avail*
The number of main storage blocks available.

*num_req*
The number of main storage blocks requested.

**Explanation:** There was insufficient working storage to carve out the number of core blocks specified in the keypoint A (CTKA).

**System Action:** The TPF system reduces the ECBs, input/output blocks (IOBS), frames, common blocks, and system work blocks (SWBs).

**User Response:** Do one of the following:

- Enter the ZFKPA command with the RED parameter specified to continue the restart.
- Enter the ZFKPA command with the CAN parameter specified to cancel the restart.

See *TPF Operations* for more information about the ZFKPA command.

---

**FKPA0007A SPECIFY OPTION — TO CONTINUE RESTART ENTER — ZFKPA RED TO CANCEL RESTART ENTER — ZFKPA CAN**

**Explanation:** This message follows the FKPA0001A message, which indicates that there was insufficient working storage to carve out the number of core blocks was specified in the system keypoint A (CTKA).

The message is also issued when a parameter that is not valid was specified with the ZFKPA command.

**System Action:** Core block counts are reduced by the nucleus initialization program. The FKPA0003E message displays.

**User Response:** If the response is to continue, the file copy of keypoint A is updated with the reduced counts and filed back before continuing with the restart.

If the response is to cancel, state change is disabled.

See *TPF Operations* for more information about the ZFKPA command. Also see the FKPA0003E message.

---

**FKPA0008A NUMBER OF COMMON BLOCKS REDUCED TO *num***

**Where:**

*num*
The number of common blocks allocated.

**Explanation:** This message is issued when there is insufficient storage below 16MB.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFKPA command.

---

**FKPA0009A NUMBER OF ECBS REDUCED TO *num1* NUMBER OF FRAMES REDUCED TO *num2***

**Where:**

*num1*
The number of ECBs allocated.

*num2*
The number of frames allocated.

**Explanation:** This message is issued when there is insufficient storage below 16 MB.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFKPA command.

---

**FKPA0010I RESTART ABORTED PER OPERATOR REQUEST**

**Explanation:** A request was made to abort the restart.

**System Action:** Restart is exited and state change is disabled.

**User Response:** None.

See *TPF Operations* for more information about the ZFKPA command.

**FKPA0011A** *num* **PAGES REMOVED TO ACCOMMODATE VIRTUAL ADDRESS SPACE**

**Where:**

*num*
The number of pages.

**Explanation:** This message is displayed when the size of the defined virtual address space overlaps with real storage.

**System Action:** The TPF system suspends restart processing and waits for you to accept the current configuration.

**User Response:** Enter one of the following:
- **ZFKPA RED** to continue TPF system restart
- **ZFKPA CAN** to cancel TPF system restart.
- **ZCTKA A SSPS**-*x* to continue TPF system restart and change the size of the required virtual address space.

See *TPF Operations* for more information about the ZFKPA and ZCTKA commands. See *TPF Main Supervisor Reference* for more information about the restart and state change functions.

**FKPA0012I** **MAXIMUM NUMBER OF THREADS REDUCED TO** *num*

**Where:**

*num*
The number of threads.

**Explanation:** This message is displayed when the number of threads defined in keypoint A (CTKA) is greater than the amount of available storage.

**System Action:** The maximum number of threads was reduced.

**User Response:** None.

**FKPA0013I** *num* **PAGES REMOVED TO ACCOMMODATE VIRTUAL ADDRESS SPACE**

**Where:**

*num*
The number of pages.

**Explanation:** This message is displayed when the size of the defined virtual address space overlaps with real storage.

**System Action:** The pages that are removed from the virtual address space are added to the machine check patch area and processing continues.

**User Response:** None.

**FLBK0000I** **SYSTEM PRINTER FALLEN BACK, NOW ON SUBCHANNEL** *aaaaa*

**Where:**

*aaaaa*
The subchannel.

**Explanation:** The receive-only (RO) device became disabled and was replaced with the device on the subchannel specified in the message.

**System Action:** None.

**User Response:** None.

**FLBK0001I** **SYSTEM CONSOLE FALLEN BACK, THIS IS NOW THE SYSTEM CONSOLE SUBCHANNEL** *aaaaa*

**Where:**

*aaaaa*
The subchannel.

**Explanation:** The prime computer room agent set (PRC) device became disabled and was replaced with the device on the subchannel specified in the message.

**System Action:** None.

**User Response:** None.

**FLBK0010W** **CONSOLE DOWN,** *aaaaa* **REPLACED BY LNIATA** *bbbbbb*

**Where:**

*aaaaa*
The console name.

*bbbbbb*
The line number, interchange address, and terminal address (LNIATA).

**Explanation:** The console specified in the message (prime computer room agent set (PRC), receive-only (RO), or PRC/RO) became disabled and was replaced with the device at the LNIATA specified in the message.

**System Action:** None.

**User Response:** None.

**FLBK0020W** **RO CRAS DOWN, NO REPLACEMENT AVAILABLE IN CRAS TABLE**

**Explanation:** The receive-only (RO) device became disabled and there was no valid alternate device available from the alternate (ALT) slots in the CRAS table (CRAT).

**System Action:** None.

**User Response:** Do the following:
1. Enter the ZACRS command to add an alternate RO device.
2. Fall back the RO device to an alternate (ALT) device.

**FMNT0001I** **GENERAL FILE DATA SET** *num* **MOUNTED ON** *addr*

**Where:**

*num*
The two digit data set number.

*addr*
The address of the device on which the data set is mounted.

**Explanation:** The general file data set specified in the message was mounted successfully. This message is issued when the BYPASS (BP) parameter is not specified on the ZFMNT command and it is verified that the specified general

file data set exists on the specified device.

When the BP parameter is specified, this additional line is appended to the message:

DATA SET *num* MAY/MAY NOT BE CONTAINED ON THE GENERAL FILE MOUNTED ON *addr*

The volume label of the specified device is not checked to verify that the general file data set specified in this message is on the pack.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFMNT command.

---

**FMNT0006E MAXIMUM NUMBER OF DATA SETS ON SYSTEM**

**Explanation:** The data set number specified in the ZFMNT command exceeds the maximum allowable number of data sets.

**System Action:** The ZFMNT command is rejected and the ECB exits.

**User Response:** If the data set number is correct, then the general file definition program (CVZD) must be regenerated with an entry for the specified data set number. It them must be loaded to the TPF system along with a patch to CTKB to cause the general file control record to be rebuilt.

See *TPF Operations* for more information about the ZFMNT command.

---

**FMNT0007E DATA SET NOT ON THIS GENERAL FILE**

**Explanation:** The ZFMNT command specified a device address and a data set number. The volume label of the addressed device does not contain the data set number specified.

**System Action:** The request is ignored and the ECB is exited.

**User Response:** Do the following:

1. Enter the ZFMNT command with the BP parameter specified if the specified data set number and device address are correct.
2. Enter the ZDGFL or ZAGFL command to display or update the label.

See *TPF Operations* for more information about the ZFMNT, ZDGFL, and ZAGFL commands.

---

**FMNT0011E DATA SET *num* NOT ASSIGNED TO SYSTEM**

**Where:**

*num*
The two digit data set number.

**Explanation:** The data set number specified in the message is not within the legal range defined for general file data set numbers.

**System Action:** The request is ignored and the ECB is exited.

**User Response:** If the data set number is correct, then the general file definition program (CVZD) must be regenerated with an entry for that data set number. It then must be loaded to the TPF system along with a patch to CTKB to cause the general file control record to be rebuilt.

See *TPF Operations* for more information about the ZFMNT command.

---

**FMNT0013E DATA SET *num* PREVIOUSLY MOUNTED**

**Where:**

*num*
The two digit data set number.

**Explanation:** The ZFMNT command request to mount general file data set specified in the message cannot be honored because it is already mounted at the time of this request.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFMNT command.

---

**FMNT0014E DATA SET *num* NOT MOUNTED. SDA *addr* NOT USABLE**

**Where:**

*num*
The two digit data set number.

*addr*
The symbolic device address (SDA).

**Explanation:** In a TPF system that is not a multiple database function (MDBF) system, this message is issued when the address specified is not available for general file use. In an MDBF system, this message is issued for the same condition or when the address specified is outside the TPF subsystem from which the command originates.

This message may have been preceded by another error message with the CPAA prefix, which contains additional diagnostic information about any errors encountered while trying to mount the volume for general file use.

**System Action:** The request is ignored and the ECB is exited.

**User Response:** None.

See *TPF Operations* for more information about the ZFMNT command.

---

**FMNT0015I GFCR MIGRATION COMPLETE**

**Explanation:** Because a record ID (RID) or record control check (RCC) error occurred while accessing the general file control record (GFCR) in the #IBMMP4 fixed file record type, the GFCR was migrated from the existing #IBMM4 processor shared fixed file record to the new #IBMMP4 processor shared fixed file record.

**System Action:** TPF system restart continues.

**User Response:** None.

---

**FMNT0017E UNABLE TO MIGRATE GFCR**

**Explanation:** An error occurred while trying to read the general file control record (GFCR) from the #IBMMP4 fixed file record type. The attempt to migrate the GFCR from the existing #IBMM4 fixed file record to the new #IBMMP4 fixed file record failed. The GFCR is initialized in the #IBMMP4 fixed file record from premount definitions in segment CVZD.

**System Action:** TPF system restart continues.

**User Response:** Do the following:

1. Check if the GFCR has been initialized satisfactorily.
2. If necessary, rebuild the GFCR by using the CVZD premount definitions or online mount procedures.

See *TPF Database Reference* for information about the general file and the GFCR.

**FMNT0018E I/O ERROR READING PREMOUNT RECORD (CVZD)**

**Explanation:** An error occurred while trying to read the premount records from segment CVZD.

**System Action:** The system restart process is ended.

**User Response:** Do the following:

1. Analyze segment CVZD to determine if it was properly initialized
2. Correct the problem
3. Restart the TPF system.

See *TPF System Generation* for more information about segment CVZD.

**FMNT0019E GENERAL FILE *label* PREVIOUSLY MOUNTED**

**Where:**

*label*
The volume label.

**Explanation:** After finding that the pack is not yet mounted, the program locates the pack's volume serial number (VSN) in the GFMT. This means you have two packs with different device addresses but with the same VSNs.

**System Action:** The request is ignored and the ECB is exited.

**User Response:** One of the two packs should be switched off the TPF system. Otherwise, on the next IPL, IPLB discovers the duplicate VSNs and throws both off the TPF system with an appropriate error message to the console.

See *TPF Operations* for more information about the ZFMNT command.

**FMNT0020E INVALID SSID FOUND ON VOLUME LABEL**

**Explanation:** The mount is not allowed because the TPF subsystem ID that owns the pack is not equal to the TPF subsystem ID from which the mount message originated.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFMNT command.

**FMNT0021E I/O ERROR READING GENERAL FILE CONTROL RECORD**

**Explanation:** An error was encountered while trying to access the general file control record.

**System Action:** None.

**User Response:** None.

**FMNT0022A GENERAL FILE CONFIGURATION MISMATCH. MOUNT MISSING PACKS OR DISMOUNT MISSING DATA SETS, THEN HARD IPL**

**Explanation:** During processing for a general file restart in a loosely coupled complex, the input/output (I/O) device configuration available to the host processor is found to be different from the configuration that is available to other processors. The general file mount process is unable to continue because mountable DASD devices are not available. This check is made only if other processors are active. If this is the only active processor, the test is bypassed, the general file configuration keypointed as found, and the message is not sent.

**System Action:** The restart is aborted and the message is issued.

**User Response:** Do one of the following:

- Mount the missing DASD volumes.
- If this is not the only processor and you cannot physically mount the missing general files, then the missing general files should be dismounted on one of the other active processors and this processor hard IPLed.

  If this is the only active processor, then other processors must still be marked active in the processor status table. An IPL with the Destruct option should be done.

**FMNT0024E FACE ERROR — INVALID RECORD TYPE**

**Explanation:** A file address compute program (FACE) error is returned on the computation of the general file control record.

**System Action:** None.

**User Response:** None.

**FMNT0025E FACE ERROR — ORDINAL NUMBER OUT OF RANGE**

**Explanation:** A file address compute program (FACE) error was returned on the computation of the general file control record.

**System Action:** None.

**User Response:** None.

**FMNT0026E VSN *label* NOT FOUND. DATA SET *num* NOT MOUNTED**

**Where:**

*label*
The volume serial number.

*num*
A two digit data set number.

**Explanation:** During general file restart, the volume specified in the message was not found. Therefore, the general file data set that resides on that volume cannot be mounted.

**System Action:** None.

**User Response:** None.

---

**FMNT0027E GENERAL FILE RESTART HAS NOT COMPLETED.**

**Segment Reference:** CVTT

**Explanation:** A ZFMNT command was entered but the TPF system has not completed general file restart.

**System Action:** The ZFMNT command is rejected.

**User Response:** Do the following:

1. Wait until the TPF system completes general file restart and is in 1052 state or higher.
2. Enter the ZFMNT command again.

See *TPF Operations* for more information about the ZFMNT command.

# FMSG

---

**FMSG0001I BEGIN DISPLAY FOR Z*code***

**Where:**

*code*
The command indicators and support consoles.

**Explanation:** The ZFMSG command was entered to request a display of the command indicators and support consoles currently defined for the Z command referenced in this message.

This is an informational message only.

**System Action:** The display is generated.

**User Response:** None.

See *TPF Operations* for more information about the ZFMSG command.

---

**FMSG0002I Z*code* ADDED**

**Where:**

*code*
The command indicators and support consoles.

**Explanation:** The ZFMSG command was entered to define a new user-defined command.

**System Action:** An entry for the Z command referenced in this message is added to the IFMSG tables. A display of the default command indicators and support consoles is generated.

**User Response:** The Z command referenced in this message is available for use. The default command indicators and support consoles may be modified by entering the ZFMSG command with the CHANGE Z*code* parameter specified.

See *TPF Operations* for more information about the ZFMSG command.

---

**FMSG0003I Z*code* REMOVED**

**Where:**

*code*
The command to be deleted.

**Explanation:** The ZFMSG command was entered to delete the Z command referenced in this message from the FMSG tables. The Z command may be a user-defined command or an override for a standard TPF system command.

This is an informational message only.

**System Action:** The entry for the Z command referenced in this message is removed from the IFMSG tables.

**User Response:** None.

See *TPF Operations* for more information about the ZFMSG command.

---

**FMSG0004I Z*code* CHANGED**

**Where:**

*code*
The command indicators or support consoles.

**Explanation:** The ZFMSG command with the CHANGE parameter specified was entered to alter the command indicators or support consoles of the user-defined command or to override the command indicators or support consoles if a standard TPF system command.

**System Action:** The requested change is made and a display of the current command indicators and consoles is generated.

**User Response:** The changes made to the Z command are available for use.

See *TPF Operations* for more information about the ZFMSG command.

---

**FMSG0005I THE FOLLOWING ZMSGS HAVE BEEN CHANGED OR ADDED**

**Explanation:** The ZFMSG command was entered to request a list of all commands for which an IFMSG entry exists. These include both user-defined commands as well as overrides of standard TPF system commands.

This is an informational message only.

**System Action:** The display is generated.

**User Response:** None.

See *TPF Operations* for more information about the ZFMSG command.

---

**FMSG0006I THERE ARE NO CHANGED OR ADDED ZMSGS**

**Explanation:** The ZFMSG command was entered and no overrides or user-defined commands exist.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZFMSG command.

**FMSG0010E Z*code* IS NOT A VALID ZMSG**

**Where:**

*code*
The command that is not valid.

**Explanation:** A ZFMSG command was entered for the command referenced in this message. This command is ***not*** a valid command.

**System Action:** None.

**User Response:** Enter the appropriate ZFMSG command again and specify a valid command.

See *TPF Operations* for more information about the ZFMSG command.

**FMSG0011E UNABLE TO RETRIEVE IFMSG TABLE**

**Explanation:** An error occurred while trying to retrieve the IFMSG table from file.

**System Action:** The IFMSG table is initialized and filed.

**User Response:** Have your system programmer review the accompanying I0000381 dump. This error may be indicative of a DASD problem. This dump is also used to perform initial creation of the IFMSG table and is issued the first time a ZFMSG command is entered.

See *TPF Operations* for more information about the ZFMSG command.

**FMSG0012E REMOVAL OF BASE DEFINITION NOT ALLOWED**

**Explanation:** The ZFMSG command was entered for a standard TPF system command for which no override exists.

**System Action:** None.

**User Response:** Verify that the command specified on the ZFMSG command with the REMOVE parameter specified is correct. You can enter **ZFMSG DISPLAY ALL** to display all the commands for which IFMSG table entries exist.

See *TPF Operations* for more information about the ZFMSG command.

**FMSG0014E NO ROOM IN IFMSG TABLE FOR Z*ssss***

**Where:**

*ssss* The command.

**Explanation:** The ZFMSG command was entered when all the IFMSG table slots are in use.

**System Action:** None.

**User Response:** Enter the ZFMSG command with the REMOVE parameter specified to free up the IFMSG table slots.

See *TPF Operations* for more information about the ZFMSG command.

**FMSG0015E Z*ssss* ALREADY EXISTS**

**Where:**

*ssss* The command.

**Explanation:** The ZFMSG command referenced in this message was entered for a command that already exists.

**System Action:** None.

**User Response:** Do one of the following:

- Enter the ZFMSG command with the ADD parameter specified and specify a unique command.
- Enter the ZFMSG command with the CHANGE parameter specified to change the characteristics of an existing command.

See *TPF Operations* for more information about the ZFMSG command.

**FMSG0016E *value* IS NOT A VALID ACTIVATION TYPE**

**Where:**

*value*
The value from the ZFMSG command with the CHANGE parameter specified.

**Explanation:** The ZFMSG command was entered and the value referenced in this message, which was specified on the ACT parameter, is not correct. Only ENTDC or ENTNC may be specified.

**System Action:** None.

**User Response:** Enter the ZFMSG command again with the CHANGE parameter specified and specify the correct value for the ACT parameter.

See *TPF Operations* for more information about the ZFMSG command.

**FMSG0017E SNA KEYWORD IS NOT VALID FOR Z*ssss***

**Where:**

*ssss* The command.

**Explanation:** The ZFMSG command was entered with the STA or STB keyword and the command specified by the Z command referenced in this message does not have a secondary action code of N. STA and STB is only valid on ZN-type commands.

**System Action:** None.

**User Response:** Enter the ZFMSG command again with the CHANGE parameter specified and specify a valid combination of command name and keywords.

See *TPF Operations* for more information about the ZFMSG command.

**FMSG0018E SNA KEYWORD CONFLICT, SPECIFY 'STAT' OR 'STB'**

**Explanation:** The ZFMSG command was entered both STA and STB keywords. Only one keyword may be specified.

**System Action:** None.

**User Response:** Enter the ZFMSG command again with the CHANGE parameter specified and specify either STA or STB.

See *TPF Operations* for more information about the ZFMSG command.

**FMSG0019E ZFMSG IS NOT FUNCTIONAL FOR 'ZL' TYPE MESSAGES**

**Explanation:** The ZFMSG command was entered for a command whose secondary action code is L. ZL commands are not supported by the ZFMSG command.

**System Action:** None.

**User Response:** Enter the ZFMSG command again and specify a valid command.

See *TPF Operations* for more information about the ZFMSG command.

# FRST–FTPD

**FRST0002I RESTART MODULE STATUS**

**Explanation:** This is a normal response to the ZFRST STATUS command with the MODULE parameter specified.

**System Action:** A list of modules in the requested status is displayed. If the ALL value for the MODULE parameter was specified, status information for all modules is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZFRST STATUS command. See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0003E** *mmmmccccchhhhrr* **ID** *cc* **NOT RESTORED — SSU** *ssss* **NOT VALID**

**Where:**

*mmmmccccchhhhrr*
The address of the record.

*cc* The tape ID.

*ssss* The subsystem user (SSU) name.

**Explanation:** While restoring logging records or restoring exception records, a record was read from tape and the subsystem user (SSU) name was found not to be valid.

**System Action:** The record is not restored.

**User Response:** None, although you may want to contact your coverage programmer to determine whether a problem really exists.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0004E NOT ACTIVE OR INVALID PARAMETER**

**Explanation:** See the explanation for the FCAP0004E message.

**System Action:** See the system action for the FCAP0004E message.

**User Response:** See the user response for the FCAP0004E message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0005E KEYPOINT FILE READ ERROR — PROGRAM EXITED**

**Explanation:** See the explanation for the FCAP0005E message.

**System Action:** See the system action for the FCAP0005E message.

**User Response:** See the user response for the FCAP0005E message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0006E MOD** *mmm* **ON** *ccud* **FROM TAPE ON** *cud* **— KPT LOST — ABORT**

**Where:**

*mmm*
The module name.

*ccud*
The device address.

*cud* The tape address.

**Explanation:** See the explanation for the FCAP0006E message.

**System Action:** See the system action for the FCAP0006E message.

**User Response:** See the user response for the FCAP0006E message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0007E KEYPOINTS NOT INITIALIZED, ENTER "CLEAR" REQUEST**

**Explanation:** See the explanation for the FCAP0007E message.

**System Action:** See the system action for the FCAP0007E message.

**User Response:** See the user response for the FCAP0007E message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0008I MOD *mmm* ON *ccud* FROM TAPE ON *cud* — STARTED**

**Where:**

*mmm*
The module name.

*ccud*
The device address.

*cud* The tape address.

**Explanation:** See the explanation for the FCAP0008I message.

**System Action:** See the system action for the FCAP0008I message.

**User Response:** See the user response for the FCAP0008I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0009I MOD *mmm* ON *ccud* FROM TAPE ON *cud* — COMPLETED**

**Where:**

*mmm*
The module name.

*ccud*
The device address

*cud* The tape address.

**Explanation:** See the explanation for the FCAP0009I message.

**System Action:** See the explanation for the FCAP0009I message.

**User Response:** See the user response for the FCAP0009I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0010I STARTED**

**Explanation:** See the explanation for the FCAP0010I message.

**System Action:** See the system action for the FCAP0010I message.

**User Response:** See the user response for the FCAP0010I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0011I COMPLETED**

**Explanation:** See the explanation for the FCAP0011I message.

**System Action:** See the system action for the FCAP0011I message.

**User Response:** See the user response for the FCAP0011I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0012E MOD *mmm* NOT VALID**

**Where:**

*mmm*
The module name.

**Explanation:** See the explanation for the FCAP0012E message.

**System Action:** See the system action for the FCAP0012E message.

**User Response:** See the user response for the FCAP0012E message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0013E TAPE *cud* INVALID**

**Where:**

*cud* The tape address.

**Note:** This variable may contain unprintable characters if the tape address specified for the ZFRST command was specified incorrectly.

**Explanation:** See the explanation for the FCAP0013E message.

**System Action:** See the system action for the FCAP0013E message.

**User Response:** See the user response for the FCAP0013E message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0014I PROCESSOR *p* RESTART COMPLETE**

**Where:**

*p* The processor ID.

**Explanation:** See the explanation for the FCAP0014I message.

**System Action:** See the system action for the FCAP0014I message.

**User Response:** See the user response for the FCAP0014I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0015I ABORTED**

**Explanation:** See the explanation for the FCAP0015I message.

**System Action:** See the system action for the FCAP0015I message.

**User Response:** See the user response for the FCAP0015I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0016I MOD *mmm* ON *ccud* FROM TAPE ON *cud* — ABORTED**

**Where:**

*mmm*
The module name.

*ccud*
The device address.

*cud* The tape address.

**Explanation:** See the explanation for the FCAP0016I message.

**System Action:** See the system action for the FCAP0016I message.

**User Response:** See the user response for the FCAP0016I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0017E MOD *mmm* INVALID OR NOT IN PROGRESS — NO ABORT**

**Where:**

*mmm*
The module address.

**Note:** This variable may contain unprintable characters if the module address specified for the ZFRST command was specified incorrectly.

**Explanation:** See the explanation for the FCAP0017E message.

**System Action:** See the system action for the FCAP0017E message.

**User Response:** See the user response for the FCAP0017E message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0018I PROCESSOR *p* PAUSED**

**Where:**

*p* The processor ID.

**Explanation:** See the explanation for the FCAP0018I message.

**System Action:** See the system action for the FCAP0018I message.

**User Response:** See the user response for the FCAP0018I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0019I TAPE *cud* DELETED**

**Where:**

*cud* The tape address.

**Explanation:** See the explanation for the FCAP0019I message.

**System Action:** See the system action for the FCAP0019I message.

**User Response:** See the user response for the FCAP0019I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0020E TAPE *cud* INVALID OR NOT IN TDCT — NOT DELETED**

**Where:**

*cud* The tape address.

**Explanation:** See the explanation for the FCAP0020E message.

**System Action:** See the system action for the FCAP0020E message.

**User Response:** See the user response for the FCAP0020E message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0021I TAPE *cud* ADDED**

**Where:**

*cud* The tape address.

**Explanation:** See the explanation for the FCAP0021I message.

**System Action:** See the system action for the FCAP0021I message.

**User Response:** See the user response for the FCAP0021I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0025I KPT STARTED**

**Explanation:** See the explanation for the FCAP0025I message.

**System Action:** See the system action for the FCAP0025I message.

**User Response:** See the user response for the FCAP0025I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0027I KPT COMPLETE**

**Explanation:** See the explanation for the FCAP0027I message.

**System Action:** See the system action for the FCAP0027I message.

**User Response:** See the user response for the FCAP0027I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0028W MOD *mmm* ON *ccud* FROM TAPE ON *cud* — STARTED *hhmm* — ACTIVE LONGER THAN EXPECTED**

**Where:**

*mmm*
The module name.

*ccud*
The device address.

*cud* The tape address.

*hhmm*
The time (in hours and minutes) that the function started.

**Explanation:** See the explanation for the FCAP0028W message.

**System Action:** See the system action for the FCAP0028W message.

**User Response:** See the user response for the FCAP0028W message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0029I XCP/LOG RESTORE COMPLETE**

**Explanation:** The function of restoring exception records or restoring logging records was completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0031E INVALID PARAMETER OR MISSING DELIMITER**

**Explanation:** See the explanation for the FCAP0031E message.

**System Action:** See the system action for the FCAP0031E message.

**User Response:** See the user response for the FCAP0031E message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0032E SEQUENCE ERROR**

**Explanation:** See the explanation for the FCAP0032E message.

**System Action:** See the explanation for the FCAP0032E message.

**User Response:** See the explanation for the FCAP0032E message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0036E UNABLE TO BACKSPACE *xxx* — RESTART ABORTED**

**Where:**

*xxx* The tape name.

**Explanation:** An irrecoverable tape error occurred while restarting the XCP/LOG restore.

**System Action:** The entry is exited.

**User Response:** Do the following:

1. Correct the error.
2. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0039E INVALID LIMITS**

**Explanation:** One of the following errors occurred:

- The cylinder or head number specified exceeds the maximum allowed for the associated modules.
- The modules specified are outside the system module range.
- The ending module number is less than the starting number.

**System Action:** The entry is exited.

**User Response:** Do the following:

1. Correct the error.
2. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0040I MOD *mmm* ON *ccud* FROM TAPE ON *cud* — RESTARTED**

**Where:**

*mmm*
The module name.

*ccud*
The device address.

*cud* The tape address.

**Explanation:** Refer to the explanation for the FCAP0040 message.

**System Action:** See the system action for the FCAP0041I message.

**User Response:** See the user response for the FCAP0041I message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0041I MOD *mmm* ON *ccud* FROM TAPE ON *cud* — TIMED OUT**

**Where:**

*mmm*
The module name.

*ccud*
The device address.

*cud* The tape address.

**Explanation:** See the explanation for the FCAP0041I message.

**System Action:** See the system action for the FCAP0041I message.

**User Response:** See the user response for the FCAP0041I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0042I ABORT IN PROGRESS**

**Explanation:** See the explanation for the FCAP0042I message.

**System Action:** See the system action for the FCAP0042I message.

**User Response:** See the user response for the FCAP0042I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0043I PAUSE IN PROGRESS PROCESSOR** *p*

**Where:**

*p* The processor ID.

**Explanation:** See the explanation for the FCAP0043I message.

**System Action:** See the system action for the FCAP0043I message.

**User Response:** See the user response for the FCAP0043I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0045A TIME OUT PAUSE CLEANUP**

**Explanation:** See the explanation for the FCAP0045A message.

**System Action:** See the system action for the FCAP0045A message.

**User Response:** See the user response for the FCAP0045A message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0047I NO CORE FOR I/O BUFFERS**

**Explanation:** See the explanation for the FCAP0047E message.

**System Action:** See the system action for the FCAP0047E message.

**User Response:** See the user response for the FCAP0047E message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0048I TDCT FULL**

**Explanation:** See the explanation for the FCAP0048I message.

**System Action:** See the system action for the FCAP0048I message.

**User Response:** See the user response for the FCAP0048I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0049I PAUSE IN PROGRESS — ALLOW COMPLETION**

**Explanation:** The input request cannot be processed because there is a pause request currently being processed.

**System Action:** None.

**User Response:** Allow the pause to complete before activating any other processing.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0050A SWITCH TO UTILITY STATE**

**Explanation:** The restore function must be run in the utility (UTIL) state.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0051E INVALID TIME SPECIFIED**

**Explanation:** A time was specified that is not valid for a ZFRST LOG or ZFRST XCP command. Valid times range from 0000 through 2359.

**System Action:** The entry is exited.

**User Response:** Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0052E INVALID DATE SPECIFIED**

**Explanation:** A date that is not valid was specified for a ZFRST LOG or ZFRST XCP command.

**System Action:** The entry is exited.

**User Response:** Enter the command again and specify a correct date.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0053E NO VALID TAPES SPECIFIED**

**Explanation:** See the explanation for the FCAP0053E message.

**System Action:** See the system action for the FCAP0053E message.

**User Response:** See the user response for the FCAP0053E message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0054E NO VALID MODULES SPECIFIED**

**Explanation:** The input request contained module parameters and none of the device addresses were found to be valid.

**System Action:** The entry is exited and no processing takes place.

**User Response:** Enter the command again and specify valid module addresses.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0057I MOD *mmm* ADDED**

**Where:**

*mmm*
The module name.

**Explanation:** See the explanation for the FCAP0057I message.

**System Action:** See the system action for the FCAP0057I message.

**User Response:** See the user response for the FCAP0057I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0058A TAPE *cud* TMNT TIME OUT**

**Where:**

*cud* The tape name.

**Explanation:** See the explanation for the FCAP0058A message.

**System Action:** See the system response for the FCAP0058A message.

**User Response:** See the user response for the FCAP0058A message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0059W [XCP] [LOG] [FCAP] [FRST] ACTIVE — ALLOW COMPLETION**

**Explanation:** See the explanation for the FCAP0059W message.

**System Action:** See the system action for the FCAP0059W message.

**User Response:** See the user response for the FCAP0059W message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0060I FCAP/FRST KEYPOINT REINITIALIZED**

**Explanation:** See the explanation for the FCAP0060I message.

**System Action:** See the system action for the FCAP0060I message.

**User Response:** See the user response for the FCAP0060I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0061E MASTER KEYPOINT FIND ERROR**

**Explanation:** An irrecoverable disk error was encountered when an attempt was made to read the master keypoint record from file.

**System Action:** The action requested by the command is not performed.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0062E WORKING KEYPOINT FILE ERROR**

**Explanation:** An irrecoverable disk error was encountered when an attempt was made to file the master copy of the capture and restore utility keypoint to the working copy's file location.

**System Action:** The initialization of the working keypoint is not accomplished.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0063E OUT OF SEQUENCE OR INVALID PARAMETER**

**Explanation:** See the explanation for the FCAP0063E message.

**System Action:** See the system action for the FCAP0063E message.

**User Response:** See the user response for the FCAP0063E message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0065W TDCT EMPTY**

**Explanation:** See the explanation for the FCAP0065W message.

**System Action:** See the system action for the FCAP0065W message.

**User Response:** See the user response for the FCAP0065W message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0066W TAPE *cud* IN USE AS *xxx* — NOT ADDED**

**Where:**

*cud* The tape address.

*xxx* The tape name.

**Explanation:** See the explanation for the FCAP0066W message.

**System Action:** See the system action for the FCAP0066W message.

**User Response:** See the user response for the FCAP0066W message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0067W NO TAPE DRIVES ON SPECIFIED *cu***

**Explanation:** See the explanation for the FCAP0067W message.

**System Action:** See the system action for the FCAP0067W message.

**User Response:** See the user response for the FCAP0067W message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0068I MOD *mmm* DUPLICATE — NOT ADDED**

**Where:**

*mmm*
The module name.

**Explanation:** This message is issued in response to a ZFRST or ZFCAP MOD command.

**System Action:** The module was already selected for the requested function.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0069I TAPE *cud* DUPLICATE — NOT ADDED**

**Where:**

*cud* The tape address.

**Explanation:** See the explanation for the FCAP0069W message.

**System Action:** See the system action for the FCAP0069W message.

**User Response:** See the user response for the FCAP0069W message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0070I MOD *mmm* ON *cud* FROM TAPE ON *cud* — IPF LOST — ABORT**

**Where:**

*mmm*
The module name.

*cud* The tape address.

**Explanation:** See the explanation for the FCAP0070I message.

**System Action:** See the system action for the FCAP0070I message.

**User Response:** See the user response for the FCAP0070I message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0071E UNABLE TO READ EOV/EOF LABELS**

**Explanation:** An error occurred while trying to read the tape EOV/EOF labels.

**System Action:** The tape is closed and the entry is exited.

**User Response:** Do the following:

1. End the function.
2. Determine the cause of the problem.
3. Take the necessary corrective action.
4. Start the function again.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0076E MOD *mmm* ON *ccud* FROM TAPE ON *cud* — TMNT T/O ABORT**

**Explanation:** See the explanation for the FCAP0076E message.

**System Action:** See the system action for the FCAP0076E message.

**User Response:** See the user response for the FCAP0076E message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0077E MOD *mmm* ON *ccud* FROM TAPE ON *cud* — TAPE ERR — PRIOR BLOCK *nnnnnn***

**Where:**

*mmm*
The module name.

*ccud*
The device address.

*cud* The tape address.

*nnnnnn*
The block sequence number of the previous tape block read.

**Explanation:** During processing of the restore function, a hard tape read error occurred. The corresponding disk track

was not restored. The prior block specified in the message is the block sequence number of the previous tape block read.

**System Action:** None.

**User Response:** See your coverage programmer for more information and the corrective action to take.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0078W** *mmmmccccchhhhrr* **— TRK NOT RESTORED**

**Where:**

*mmmmccccchhhhrr*
The address of the track.

**Explanation:** A hard (non-recoverable) error occurred while writing to this track. Every record on this track is considered to be lost. An alternate track can be assigned when the restore function is complete. The track can then be restored by using the THRU form of the ZFRST CAP command.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0079W** **TRACK** *mmmmccccchhhhrr* **HAD X'***nn***' RECORD(S) NOT RESTORED**

**Where:**

*mmmmccccchhhhrr*
The address of the track.

*nn* The number of records.

**Explanation:** The restore function was unable to write the indicated number of records to disk.

**System Action:** See the system action for the FRST0078W message.

**User Response:** See the user response for the FRST0078W message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0082E** **ECB LEVEL 0 ILLEGAL**

**Explanation:** See the explanation for the FCAP0082E message.

**System Action:** See the system action for the FCAP0082E message.

**User Response:** See the user response for the FCAP0082E message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0083E** **ECB LEVEL** *n* **GREATER THAN ALLOWED**

**Where:**

*n* The ECB level.

**Explanation:** See the explanation for the FCAP0083E message.

**System Action:** See the system action for the FCAP0083E message.

**User Response:** See the user response for the FCAP0083E message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0084I** **ECB LEVEL ALTERED TO** *n*

**Where:**

*n* The ECB level.

**Explanation:** See the explanation for the FCAP0084I message.

**System Action:** See the system action for the FCAP0084I message.

**User Response:** See the user response for the FCAP0084I message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0085W** **INVALID SIZE TAPE RECORD — IGNORED**

**Explanation:** A record size error occurred while reading a record from tape during the keypoint restore function.

Keypoint records are critical system records.

**System Action:** The record is not restored.

**User Response:** Do the following:

1. Check the problem to determine the possible effects on the TPF system.
2. Take the necessary corrective action.
3. Run the keypoint restore function again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0086W** **DISK WRITE ERROR —** *mmmmccccchhhhrr* **ID** *cc* **— NOT RESTORED**

**Where:**

*mmmmccccchhhhrr*
The address of the keypoint or tape label record being restored.

*cc* The keypoint or record ID.

**Explanation:** A disk write error occurred while restoring a keypoint or a tape label record. The record is not restored.

If the ID specified in the message is CK, then the error occurred while filing a keypoint.

If the ID specified in the message is TZ, then the error

occurred while filing a tape label record.

This is a serious problem if the error occurred when filing a keypoint. The keypoint records are system critical records and if they are not restored, operation of the TPF system could be seriously affected.

**System Action:** Processing continues through the end of the job.

**User Response:** Do the following:

1. Check the problem to determine the possible effects on the TPF system.
2. Take the necessary corrective action.
3. Run the keypoint restore function again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0087W TAPE READ ERROR — PRECEDING RECORD AT** *mmmmcccchhhhrr*

**Where:**

*mmmmcccchhhhrr*
The address of the record.

**Explanation:** A tape read error occurred while restoring a keypoint or a tape label record. The record is not restored. The address specified in the message is that of the last record validly read.

If the error occurred while trying to read a keypoint, review keypoint X to determine the likely address of the record in error. Keypoint X contains the addresses of all the keypoint records and the keypoint whose address appears after the one indicated in the message is probably the one that caused the error.

This is a serious problem if the error occurred when restoring a keypoint. The keypoint records are system critical records and if they are not restored, operation of the TPF system could be seriously affected.

**System Action:** Processing continues through the end of the job.

**User Response:** Do the following:

1. Check the problem to determine the possible effects on the TPF system.
2. Take the necessary corrective action.
3. Run the keypoint restore function again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0088W REQUESTED FILE NOT ON TAPE** *xxx*

**Where:**

*xxx* The tape name.

**Explanation:** A request was made to restore exception records, restore logging records, or to start the keypoint restore function but the tape specified in the message did not contain the requested file.

**System Action:** For keypoint records, the entry is exited. For the other tapes, the restore function is continued.

When restoring XCP/LOG records with mult-reel files from multiple processors, it is possible that this condition is valid for a particular processor. For example, the processor may have been down during the requested restore period and the file does not exist on that tape. This is a valid condition.

**User Response:** Do one of the following:

- In the case of keypoint records, mount the correct tape and enter the command again.
- For XCP/LOG records, determine whether it is valid to have a missing file. If it is valid, allow the restore function to complete. If it is not valid:
  1. Stop the restore function.
  2. Mount the correct tape.
  3. Enter the command again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0089A MUST IPL SS IN PROCESSOR(S) TO CONTINUE**

**Explanation:** This message is the output when the keypoint restore function is complete. The keypoints were restored to file and must be moved to core. This is accomplished by TPF system restart.

**System Action:** None.

**User Response:** IPL the TPF system again.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0091I DUPLICATE RESTORE OPTION SELECTED**

**Explanation:** This message displays when the D parameter is specified on the restore command.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0092I VERIFY OPTION SELECTED**

**Explanation:** The verify option was specified.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0093A TAPE ON** *cud* **FOR MOD** *mmm* **— ALREADY RESTORED — REMOVE**

**Where:**

*cud* The tape address.

*mmm*
The module name.

**Explanation:** You mounted a CAP tape that was processed already.

**System Action:** None.

**User Response:** Replace the tape with another CAP tape.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0094A** **TAPE ON *cud* FOR MOD *mmm* — NOT SELECTED — REMOVE**

**Where:**

*cud* The tape address.

*mmm*
The module name.

**Explanation:** You mounted a CAP tape for a module that was not selected for restoration.

**System Action:** None.

**User Response:** Replace the tape with another CAP tape.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0095A** **TAPE ON *cud* FOR MOD *mmm* — NOW BEING RESTORED — REMOVE**

**Where:**

*cud* The tape address.

*mmm*
The module name.

**Explanation:** Multi-reel input must be run in sequential order. Two tapes for the same module cannot be run at the same time.

**System Action:** None.

**User Response:** Replace the CAP tape on the drive specified in the message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0096I** **TAPE ON *cud* FOR MOD *mmm* — MODULE OFFLINE**

**Where:**

*cud* The tape address.

*mmm*
The module name.

**Explanation:** The referenced module is in offline status.

**System Action:** None.

**User Response:** Ensure that the module is online before using the drive specified in the message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0097I** **TAPE ON *cud* FOR MOD *mmm* — NOT FIRST REEL**

**Where:**

*cud* The tape address.

*mmm*
The module name.

**Explanation:** Each restore tape is checked for proper reel number sequence. This check can be bypassed by specifying the BP parameter.

**System Action:** None.

**User Response:** Mount the first reel for this module.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0098A** **TAPE ON *cud* — NOT A RESTORE TAPE — REMOVE**

**Where:**

*cud* The tape address.

**Explanation:** The tape on the drive specified in the message is not a restore tape.

**System Action:** None.

**User Response:** Replace it with a valid restore tape.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0099A** **TAPE ON *cud* — READ ERROR — UNIDENTIFIABLE — REMOVE**

**Where:**

*cud* The tape address.

**Explanation:** The restore function was unable to read the first three records on the tape.

**System Action:** None.

**User Response:** If the tape is a valid restore tape, try to bypass the records in error by using a tape-to-tape copy program or use a backup tape.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0100A** **TAPE ON *cud* FOR MOD *mmm* — REWIND ERROR — REMOVE**

**Where:**

*cud* The tape address.

*mmm*
The module name.

**Explanation:** An input/output (I/O) error occurred while rewinding the tape on the drive specified in the message.

**System Action:** None.

**User Response:** Delete the tape drive from the tape device control table (TDCT).

If the error continues, see your IBM service representative.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0101E** *mmmmccccchhhhrr* **— RESTORE VERIFY ERROR**

**Where:**

*mmmmccccchhhhrr*
The address of the track.

**Explanation:** The restore function was unable to verify the track just written. Every record on this track is considered to be lost. An alternate track can be assigned when the restore function is completed.

**System Action:** None.

**User Response:** Enter the THRU form of the ZFRST CAP command to restore the track.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0102W** **FOLLOWING DUPLICATE AREAS NOT RESTORED — IN RELATION TO MOD** *mmm*

**Where:**

*mmm*
The module name.

**Explanation:** This message is the output at the end of the restore function for each module that was restored.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0103I** *mmmmccccchhhhrr* **THRU** *mmmmccccchhhhrr* **DUPE OF PRIME** *mmmmccccchhhhrr* **THRU** *mmmmccccchhhhrr*

**Where:**

*mmmmccccchhhhrr*
The address of the track.

**Explanation:** The tracks specified in the message were not restored and they contain duplicate tracks of the primary duplicated tracks specified in the message.

**System Action:** None.

**User Response:** Give the report to your coverage programmer for more information.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0104I** *mmmmccccchhhhrr* **THRU** *mmmmccccchhhhrr* **PRIME OF DUPE** *mmmmccccchhhhrr* **THRU** *mmmmccccchhhhrr*

**Where:**

*mmmmccccchhhhrr*
The address of the track.

**Explanation:** The track specified in the message were not restored and they contain prime tracks of the duplicated primary tracks specified in the message.

**System Action:** None.

**User Response:** Give the report to your coverage programmer for more information.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0105I** *mmmmccccchhhhrr* **— ZEROED RECORD RESTORED — NEVER CAPTURED**

**Where:**

*mmmmccccchhhhrr*
The address of the record.

**Explanation:** A zeroed record was detected by the restore function and is filed to disk because the FZ parameter was specified.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0106E** **TAPE ON** *cud* **FOR MOD** *mmm* **NOT FOR MOD** *mmm* **— ENTRY ABORTED**

**Where:**

*cud* The tape address.

*mmm*
The module name.

**Explanation:** You placed a tape reel on the drive specified in the message and this tape reel was not for the same module as the previous reel.

**System Action:** None.

**User Response:** Place the correct tape on the drive specified in the message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0107E** **TAPE ON** *cud* **FOR MOD** *mmm* **— BLK SEQ CHECK — TAPE BLOCK JUST READ** *nnnnnn* **— PRIOR BLOCK** *nnnnnn*

**Where:**

*cud* The tape address.

*mmm*
The module name.

*nnnnnn*
The tape block.

**Explanation:** The tape block sequence checking detected an out-of-sequence tape block. This message is issued as a warning only.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0108E** **TAPE ON *cud* FOR MOD *mmm* — REEL SEQ CHECK — REEL JUST READ *nnnn* — PRIOR REEL *nnnn* — ENTRY ABORTED**

**Where:**

*cud* The tape address.

*mmm*
The module name.

*nnnn*
The reel name.

**Explanation:** Multi-reel restore input must be run in ascending reel number order.

**System Action:** None.

**User Response:** Mount the correct reel on the drive specified in the message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0109I** **BYPASS REEL SEQUENCE CHECK SPECIFIED**

**Explanation:** The restore command was entered with the BP parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0110I** **MOD *mmm* ON *ccud* FROM TAPE ON *cud* FULLY DUPLICATED — DUPLICATE RESTORE FORCED**

**Where:**

*mmm*
The module name.

*ccud*
The device address.

*cud* The tape address.

**Explanation:** The restore function detected that the TPF system may have duplicated records residing on modules outside of the module range in the restore keypoint and is forcing a duplicate restore.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0113I** **FILE ZEROED RECORD OPTION SELECTED**

**Explanation:** The restore command was entered with the FZ parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0114I** ***mmmmccccchhhhrr* ZEROED RECORD NOT RESTORED — NEVER CAPTURED**

**Where:**

*mmmmccccchhhhrr*
The address of the record.

**Explanation:** The restore function detected a zeroed record and is not filing it because the the FZ (file zeroed record) parameter was not specified.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST00115** **TAPE NOT ADDED — CU NOT IN TCUD — *cud***

**Where:**

*cud* The tape address.

**Note:** This variable may contain unprintable characters if the tape address specified for the ZFRST command was specified incorrectly.

**Explanation:** See the explanation for the FCAP00115 message.

**System Action:** See the system action for the FCAP00115 message.

**User Response:** See the user response for the FCAP00115 message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0117E** **DUAL TAPE NOT ADDED — CUD'S EQUAL — *cud*–*cud***

**Where:**

*cud* The tape address.

**Explanation:** A restore start or tape add message attempted to add a dual type entry where both tapes specified were the same. The tapes must be two different drives.

**System Action:** Enter tapes which are different drives.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0118E TAPE ON *cud* FOR MOD *mmm* — INVALID DRIVE — ENTRY ABORTED**

**Where:**

*cud* The tape address.

*mmm*
The module name.

**Explanation:** The restore function found that a CAP tape is not mounted on the prior active drive for the entry or its alternate.

**System Action:** The restore function for the indicated module is aborted.

**User Response:** Restart the entry by mounting the first reel of the tape to be restored on a drive available to the restore function.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0119I DUAL TAPE *cud–cud* ADDED**

**Where:**

*cud* The tape address.

**Explanation:** A restore start or tape add request caused a dual tape to be made available to the Restore program.

**System Action:** None.

**User Response:** Successive reels of multi-reel files should be mounted on these tape drives.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0120I DUAL TAPE *cud–cud* DELETED**

**Where:**

*cud* The tape address.

**Explanation:** As a result of a Restore tape delete request, the dual tape defined, which is specified in the message, was made unavailable to the restore function.

**System Action:** Any module restore that is in progress on the deleted drives is aborted and will be restarted at a later point in time.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0121A TAPE ON *cud* FOR MOD *mmm* — SWITCHED, REMOVE PRIOR REEL FROM *cud***

**Where:**

*cud* The tape address.

*mmm*
The module name.

**Explanation:** The restore function automatically switched from the active to the alternate tape drive during a multi-reel restore.

**System Action:** None.

**User Response:** When the tape has rewound, remove it and mount the next reel or the first reel of any tape remaining to be restored.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0122A TAPE ON *cud* FOR MOD *mmm* — REEL COMPLETED ISSUE TAPE ALT MESSAGE TO SET UP ALT DRIVE FOR REEL 2**

**Where:**

*cud* The tape address.

*mmm*
The module name.

**Explanation:** The restore of a multi-reel tape file is in progress and there is no alternate tape drive available for the next reel.

**System Action:** None.

**User Response:** Do the following:

1. Ready the drive with the next reel to be restored.
2. Add an alternate tape drive.

**Note:** Do not enter the ZTMNT command.

See *TPF Operations* for more information about the ZTMNT command. See *TPF Database Reference* for more information about the capture and restore utility and the tape add function.

---

**FRST0123A MOUNT *xxx***

**Where:**

*xxx* The tape name.

**Explanation:** See the explanation for the FCAP0123A message.

**System Action:** See the system action for the FCAP0123A message.

**User Response:** See the user response for the FCAP0123A message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0124A RE–INPUT START REQUEST**

**Explanation:** See the explanation for the FCAP0124A message.

**System Action:** See the system action for the FCAP0124A message.

**User Response:** See the user response for the FCAP0124A message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0125E MOD *mmm* ON *ccud* FROM TAPE ON *cud* MODULE DOWN — ENTRY ABORTED**

**Where:**

*mmm*
The module name.

*ccud*
The device address.

*cud* The tape address.

**Explanation:** The module referenced in the message was taken offline. Therefore, the entry processing it was aborted.

**System Action:** None.

**User Response:** Remount the restore tapes for this module when it is brought online again.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0126I MOD *mmm* IS *status***

**Where:**

*mmm*
The module name.

*status*
One of the following:

- COMPLETE
- INPROGRESS
- NOT SELECTED
- NOT STARTED.

**Explanation:** This is the normal response to the ZFRST STATUS command with the MODULE parameter specified to request the status of a specific module.

**System Action:** The status of the specified module is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZFRST STATUS command. See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0127E NO DUAL TAPE SPECIFIED**

**Explanation:** A request to make an alternate tape drive available to the restore function did not specify the alternate tape.

**System Action:** None.

**User Response:** Enter the command again and specify an alternate tape drive.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0128E DUAL TAPE NOT ADDED — TAPE *cud* NOT IN TDCT**

**Where:**

*cud* The tape address.

**Explanation:** In a request to make an alternate tape drive available to the restore function, the first tape specified was not an existing restore tape.

**System Action:** None.

**User Response:** Enter the command again correctly.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0129E DUAL TAPE NOT ADDED — ALT *cud*–*cud* ALREADY EXISTS**

**Where:**

*cud* The tape address.

**Explanation:** A request to make an alternate tape drive available to the restore function specified a drive for which an alternate already exists.

**System Action:** None.

**User Response:** Enter the command again by using an unused tape drive.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0130I TAPE *cud* — ALT TAPE TIME OUT — ENTRY ABORTED**

**Where:**

*cud* The tape address.

**Explanation:** No alternate drive was specified for the restore tape referenced in the message, and an alternate tape was not added in response to the FRST0122A message. The restore function automatically restarts the restore of the module at a later point in time.

**System Action:** None.

**User Response:** Add an alternate drive for the specified tape when requested.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0131E DDCT FILE READ ERROR — PROGRAM EXITED**

**Explanation:** See the explanation for the FCAP0131E message.

**System Action:** See the system action for the FCAP0131E message.

**User Response:** See the user response for the FCAP0131E message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0134I PROCESSOR *p* COMPLETED**

**Where:**

*p* The processor ID.

**Explanation:** A participating processor completed the capture

and restore utility. assigned to it.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0135E DDCT FILE READ ERROR**

**Explanation:** See the explanation for the FCAP0135E message.

**System Action:** See the system action for the FCAP0135E message.

**User Response:** See the user response for the FCAP0135E message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0137E NO PROT UTIL ENTRY FOUND FOR THIS PROCESSOR**

**Explanation:** See the explanation for the FCAP0137E message.

**System Action:** See the system action for the FCAP0137E message.

**User Response:** See the user response for the FCAP0137E message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0138E PROT FACE ERROR ON ORDINAL** *cc*

**Where:**

*cc* The ordinal number.

**Explanation:** See the explanation for the FCAP0138E message.

**System Action:** See the system action for the FCAP0138E message.

**User Response:** See the user response for the FCAP0138E message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0139E INVALID MOD DEVICE TYPE**

**Explanation:** See the explanation for the FCAP0139E message.

**System Action:** See the system action for the FCAP0139E message.

**User Response:** See the user response for the FCAP0139E message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0142W TAPE DEVICE** *cud* **NOT ASSIGNED TO PARTICIPATING PROC**

**Where:**

*cud* The device address.

**Explanation:** See the explanation for the FCAP0142W message.

**System Action:** See the system action for the FCAP0142W message.

**User Response:** See the user response for the FCAP0142W message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0143E PROC** *p* **NOT IN UTIL STATE**

**Where:**

*p* The processor ID.

**Explanation:** The indicated participating processor is not in utility state which is required for all participating processors for the restore function to start.

**System Action:** The entry is exited.

**User Response:** Cycle processor to utility state and reenter message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0145E NO VALID TAPE DEVICE FOR PROC** *p*

**Where:**

*p* The processor ID.

**Explanation:** See the explanation for the FCAP0145E message.

**System Action:** See the system action for the FCAP0145E message.

**User Response:** See the user response for the FCAP0145E message.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0147E CTK. RETRIEVAL ERROR FOR PROC** *p*

**Where:**

*p* The processor ID.

**Explanation:** There was a retrieval error for the processor referenced in the message.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about the capture and restore utility.

---

**FRST0148E PROT FIND ERROR — ADDR** *address*

**Where:**

*address*
The address.

**Explanation:** See the explanation for the FCAP0148E message.

**System Action:** See the system action for the FCAP0148E message.

**User Response:** See the user response for the FCAP0148E message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0152E MORE MOD NUMBERS EXPECTED**

**Explanation:** See the explanation for the FCAP0152E message.

**System Action:** See the system action for the FCAP0152E message.

**User Response:** See the user response for the FCAP0152E message.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0161E DUAL TAPES MUST BE OF THE SAME DEVICE TYPE. DUAL TAPE** *cud–cud* **NOT ADDED**

**Where:**

*cud* The tape address.

**Explanation:** A dual tape was added to the tape device control table (TDCT) and both tapes were not of the same device type.

**System Action:** None.

**User Response:** When entering dual tapes, make sure both tapes belong to the same device type.

See *TPF Database Reference* for more information about the capture and restore utility.

**FRST0030E INVALID BLOCK FORMAT**

**Explanation:** The physical block was read from a tape mounted in block mode but the block did not conform to blocked tape.

The tape may have been created in unblocked mode or the integrity of the data may be questionable.

**System Action:** The ECB is ended.

**User Response:** Do the following if the tape was created in block mode:

1. Mount the tape in unblocked mode.
2. Run the application program again.

**FTPD0001I CAN NOT OPEN LOG FILE, NO LOG FILE IS KEPT**

**Explanation:** An error occurred when trying to open a log file for a File Transfer Protocol (FTP) client.

**System Action:** FTP processing continues; however FTP errors will not be logged.

**User Response:** Verify that the root directory has the write permission bit set on by doing one of the following:

- If the write permission bit is already set on, see your system programmer.
- To set the write permission bit on, enter the ZFILE chmod command with a value of 777 specified for the *permission* parameter and a value of `tmp` specified for the *path* parameter.

See *TPF Operations* for more information about the ZFILE chmod command.

# GAFA–GOGO

**GAFA0001I DEVA SDP F.A.–***xxxxxxxx*

**Where:**

*xxxxxxxx*
The file address.

**Explanation:** This is the normal response to the ZGAFA command.

**System Action:** None.

**User Response:** None.

**GAFA0002T GFS INACTIVE IN 1052/UTIL STATE**

**Explanation:** Get file storage (GFS) is not active in 1052 or utility (UTIL) state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZGAFA command.

**GAFA0003T INVALID FORMAT**

**Explanation:** The format is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZGAFA command.

**GAFA0004T** *xxxx* **INVALID DEVICE CODE**

**Where:**

*xxxx*
The device code.

**Explanation:** The device code referenced in the message is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZGAFA command.

---

**GAFA0005T** *yyy* **INVALID POOL CODE**

**Where:**

*yyy* The pool code.

**Explanation:** The pool code referenced in the message is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZGAFA command.

---

**GAFA0006T** *xxxx yyy* **INVALID POOL FOR THE SYSTEM**

**Where:**

*xxxx*
The device code.

*yyy* The pool code.

**Explanation:** The pool referenced in the message is not valid for the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZGAFA command.

---

**GAFI0006T RECORD ID/POOL COMBINATION NOT FOUND IN RIAT**

**Explanation:** The ID specified in the ZGAFI command does not exist in the record ID attribute table (RIAT).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZGAFI command.

---

**GAFI0008I** *input message* **FILE ADDRESS-***fileaddr*

**Where:**

*input message*
The command.

*fileaddr*
The 16-digit hexadecimal file address.

**Explanation:** This is the normal response to the ZGAFI command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZGAFI command.

---

**GAFI0009T GFS INACTIVE IN 1052/UTIL STATE**

**Where:**

**Explanation:** Get file storage (GFS) is not active in 1052 state or utility (UTIL) state. Therefore, the ZGAFI command is not valid.

**System Action:** None.

**User Response:** Do the following:

1. Cycle the TPF system above the UTIL state.
2. Enter the ZGAFI command again.

See *TPF Operations* for more information about the ZGAFI command.

---

**GAFI0010T NO SON POOL IN SYSTEM**

**Where:**

**Explanation:** The ZGAFI command was entered, but no pools exist in the TPF system.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZGAFI command.

---

**GAFI0011T SPECIFIED RIAT TYPE IS NOT CORRECT**

**Explanation:** The ZGAFI command was entered with a RIAT type parameter that is not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct RIAT type to use for the ZGAFI command.
2. Enter the command again and specify the correct RIAT type.

See *TPF Operations* for more information about the ZGAFI command.

---

**GFSP0003I GFS SET SIZE DISPLAY**

**Explanation:** This is the normal response to theZGFSP DSP command with the SET parameter specified.

**System Action:** Processing is continued.

**User Response:** None.

See *TPF Operations* for more information about theZGFSP DSP command and an example of its output, as well as miscellaneous file pool functions.

---

**GFSP0004I** *input message* **— FUNCTION PREVIOUSLY PERFORMED**

**Where:**

*input message*
The command.

**Explanation:** This is the normal response to the ZGFSP OPT command when the requested function already completed.

**System Action:** Processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZGFSP OPT command and miscellaneous file pool functions.

---

**GFSP0005I** *input message* **- PERFORMED**

**Where:**

*input message*
The command.

**Explanation:** This is the normal response to a ZGFSP command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZGFSP commands and miscellaneous file pool functions.

---

**GFSP0006I GFS PARAMETER DISPLAY**

**Explanation:** This is the normal response to the ZGFSP DSP command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZGFSP DSP command and for an example of the informational display as well as miscellaneous file pool functions.

---

**GFSP0050E INVALID PERCENTAGE ENTERED**

**Explanation:** This is the response from the ZGFSP command with either the REJ or STR parameter specified when the numeric parameter is not a valid percent.

**System Action:** The message is ignored.

**User Response:** Enter the command again and specify a valid percent value.
