WorkSoft CERTIFY™

You've got to get to the market fast with quality results, yet stay within budget. It can take weeks or even months to learn and use test automation tools that many times don't work. And that's before you even begin to contemplate maintaining the tests. The whole process can be frustrating, time-consuming and counterproductive.

Now there's a solution that not only eliminates testing nightmares, but organizes and analyzes the processes that put you in control of your enterprise's business certification.

Don't just automate. Certify™.

WorkSoft's Certify™ is a business process certification solution that transcends traditional automated testing, enabling users to create an enterprise-level model of operations and business processes that can be executed against changes to their business applications before they affect production.

Certify's™ business user-friendly design takes hours, not days to learn. Its uniform, centralized repository of test knowledge supports all of your applications and platforms, and cross-platform test support lets you deliver real end-end testing across mainframes and client/server systems.

The fully integrated life-cycle approach means you are ready to start executing, not developing tests, when code is ready, which accelerates your time to market while increasing coverage and quality.

And down the line, as the inevitable changes are made to your critical applications and processes, Certify's™ automated impact analysis and maintenance capabilities keep your repository current.

WorkSoft CERTIFY™

: the solution for change

Certify™ features five powerful components that are organized around your team and across your business. Certify™ is especially effective, because it leverages the expertise that is unique to your business with the automation expertise that is unique to WorkSoft.

Organize lets you model operations over time, operating cycles, applications, and platforms. It provides an enterprise-level view of your business environment and the people who work in it.

Plan allows project managers to plan certification for each application. This allows you to execute your critical business processes in sequence and provides you with flexible ways to trace, sort and report any criteria you choose.
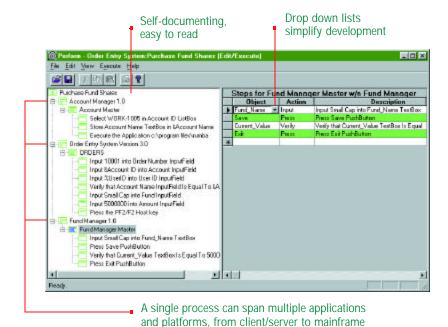

Define identifies all the sources and uses of application data. This module helps application analysts describe each source of data and traces the flow of information through the application, verifying it at each point and in each form. Best of all, it allows Certify™ to track changes to the application and lets you know how it will impact your business.

Perform provides application analysts with a tool to detail each process step into individual actions. These actions, expressed in English, are linked to the application design and the supporting scripts. They are self-documenting, maintainable and automatically or manually executable. Results from each and every action are logged precisely and provide a documented audit trail.

Analyze gives management a tool to collect and analyze information about the certification process, providing a top-down view of what is getting done, how long it takes, who is doing it and what the return on investment is.

Self-documenting, easy to read

Drop down lists simplify development

A single process can span multiple applications and platforms, from client/server to mainframe

Certify requires: Pentium PC or greater and 100% compatibles ● 32MB minimum memory ● Windows 95, Windows 98, or Windows NT ● 20MB minimum disk storage plus project database size ● Supports Walldata Rumba, Attachmate Extra! and IBM PC 3270 emulation
