# 1. FOREWORD

## FOREWORD

### PURPOSE OF THIS MANUAL

This manual is intended for the VisualAge Pacbase Administrator. It describes the steps and instructions for retrieving databases created in Pacbase releases older than Rel.8.0.2v02.

As a general rule, it is advised to install the new release/version in an environment quite separate from the older release environment, i.e, with different installation parameters.

## 2.2. *THE BATCH PROCEDURES*

### THE BATCH PROCEDURES

Procedures associated with batch processing are described in Parts II and III of the Operations Manual (Batch Procedures: Administrator's Guide --for those procedures involving only the Database Administrator-- and User's Guide --for those available to the user).

The documentation of each procedure includes the following:

- . General presentation
  - Introduction
  - Execution conditions
  - Corrections in case of an ABEND.
- . Description of user input, processing and results, as well as recommendations for use.
- . Description of steps
  - List of permanent and temporary files in use,
  - Return codes (if any) produced by each step.
- . Command file (JCL lines).

PROCEDURE CLASSIFICATION

Batch procedures are documented in the following manuals:

Batch procedures - Administrator's Guide:

- 1) Database management utilities.
- 2) Versioning utilities (PEI and Pactransfer).
- 3) Manager's utilities.
- 4) Migrations.

Batch procedures - User's guide:

- 1) Standard procedures.
- 2) Personalized extraction and automated documentation.
- 3) Quality analysis and control.
- 4) Methodology integrity check.
- 5) Pactables.
- 6) Impact Analysis.
- 7) VisualAge Smalltalk / VisualAge Pacbase Bridge.

RETRIEVAL OF PACBASE 8.0 OR 8.0.1  
8.0, 8.0.1 RETRIEVALS - OPERATIONS TO BE PERFORMED

RETRIEVAL OF PACBASE 8.0 OR 8.0.1		3
8.0, 8.0.1 RETRIEVALS - OPERATIONS TO BE PERFORMED		1

### *3.1. 8.0, 8.0.1 RETRIEVALS - OPERATIONS TO BE PERFORMED*

#### 8.0, 8.0.1 RETRIEVALS: OPERATIONS TO BE PERFORMED

The retrieval of existing applications allowing for the transformation of a PACBASE 8.0 or 8.0.1 database into a database compatible with the new PACBASE release is broken down into the following phases:

- . Retrieval of 8.0 user parameters
- . Retrieval of 8.0 database(s)

For users of the PEI function:

- . Retrieval of Production Environment Interface (PEI)

For users of the WorkStation:

- . Retrieval of YSM methodology
- . The WorkStation's dedicated User Entities must be uploaded into the Database via the UPDT procedure, after the Database has been retrieved and restored in the new release.

Retrieval JCLs for the appropriate sequencing of these steps are supplied. They should be adapted by the user.

1-Retrieval of User parameters

- . Retrieval of the 8.0 or 8.0.1 user parameters backup (PE80 procedure).

CAUTION: The SYSTEM ACCESS KEY must be entered on the NK input line of the retrieval procedure.

- . Re-initialization of the AE file from the AE0 file supplied for installation.

Execution of the new PARM procedure using as input the PE backup file produced by the parameter retrieval, the '\*\*\*\*\*' user code, and NRREST as input parameter.

- . Use of the WorkStation: execution of the new PARM procedure. The input should include the transactions associated to the parameters settings for the methodology used (NRCHAR command).

Refer to the paragraph describing the installation of the methodology choices, in Chapter 'INSTALLATION' of the Environment & Installation manual for this VisualAge Pacbase release.

RESULT: AE and AP files, containing the 8.0 user parameters retrieved in the new format.

## 2-Retrieval of an 8.0 Database

- . 8.0 backup of the database whose output is an 8.0 PC file (8.0 SAVE procedure).
- . Retrieval of the resulting PC 8.0 file in the new format (PC80 procedure), producing a new-format PC backup.
- . If you are using the YSM method with the new release of the WorkStation, retrieval of YSM method (PCYS procedure) from the new-format PC backup.
- . Reorganization (new REOR) of the new-format backup obtained from the previous step.
- . Journal file (new format) initialization (ARCH).
- . Database new format) restoration (REST) (new PC file obtained from REOR as input).
- . 8.0 Backup of generation-printing commands (8.0 SVAG procedure), whose output is an 8.0 PG file.
- . Reorganization-restoration of generation-print commands (new REAG) from the 8.0 PG backup in the previous step.

If libraries, sessions, and/or user codes have been deleted via the database reorganization, the corresponding transactions must be entered for the reorganization of the AG file. Obsolete generation-print requests related to deleted sessions or libraries will be purged. Commands entered by users in 8.0 and cancelled in the new release will also be purged from the AG file.

RESULT: The AJ, AN, AR, and AG files are operational under the new VisualAge Pacbase Release.

### 3-Retrieval of an 8.0 Production Environment Interface

- . 8.0 PEI backup file (8.0 SVPE procedure) whose output is a 8.0 PP file.
- . PEI restoration (new RSPE procedure) using as input the backup produced by the previous step.

RESULT: The AB and AC files are operational under the new VisualAge Pacbase release.

### 4-Retrieval of the YSM Methodology

Perform the retrieval of PACBASE 8.0/8.0.1 as described above by executing the PCYS procedure after retrieving the PC file (PC80 procedure), and before reorganizing the database (REOR procedure).

Retrieval of the Archived Journal is also available (PJYS).

Refer to Chapter 'RETRIEVAL OF THE YSM METHODOLOGY' for complete information about these procedures.

### 5-Retrieval of an 8.0 Archived Journal in the new format (optional)

PJ80 batch procedure.

A procedure for the retrieval of the 8.0 archived journal in the new format is also supplied.

It provides for the analysis (ACTI procedure), transaction extraction (EXPJ procedure), restoration-retrieval (REST/RESY procedures with the REC parameter) of transactions archived in the 8.0 release, using the new releases of the procedures.

DSMS users who have modified their product code(s) in the new DSMS release can perform this code change in the PACBASE journal, using an input of the PJ80 procedure.

RETRIEVAL OF PACBASE 8.0 OR 8.0.1

```

### 3.5. PJ80 - RETRIEVAL OF ARCHIVE JOURNAL

#### RETRIEVAL OF ARCHIVE JOURNAL

With release 8.0.2 or later of the DSMS Function, it is possible to modify the Product Code when retrieving the previous database. The Code format changes from 1 to 3 characters.

This possibility is also offered when retrieving the PACBASE archived journal from a previous release.

#### USER INPUT (optional)

```
+-----+
! Pos. ! Len. ! Value ! Meaning !
!-----!
!   1  !   4  ! 'onnn'! Modification of DSMS Product Code !
!       !     !       ! o = former Product Code         !
!       !     !       ! nnn = new Product Code          !
!       !     !       ! (1, 2 or 3 characters)         !
+-----+
```

On a line, the 'onnn' character string may be repeated as many times as there are Product Codes to be modified, with a limit of 20.

NOTE: The validity of this input is not checked for proper syntax. The procedure's syntax should be carefully checked before execution, since no output report is produced.

```

## **4. RETRIEVAL OF PACBASE 7.3**

#### *4.1. 7.3 RETRIEVAL - OPERATIONS TO BE PERFORMED*

##### 7.3 RETRIEVAL: OPERATIONS TO BE PERFORMED

The retrieval of existing applications allowing for the transformation of a PACBASE 7.3 database into a new database is broken down into three phases:

PHASE 1:

- . Retrieval of 7.3 user parameters

PHASE 2:

- . Retrieval of 7.3 database(s)

PHASE 3 (for users of the PEI function):

- . Retrieval of 7.3 Production Environment

These operations require the use of specific and/or standard management procedures of the new VisualAge Pacbase release.

Retrieval JCLs chaining the various steps of the procedures are provided. They must be completed by the user.

Once the Database has been retrieved and restored, User Entities specific to the WorkStation must be re-introduced into the Database via the UPDT batch update procedure.

1-Retrieval of User parameters

- . Retrieval of the User parameters backup from the 7.3 release (procedure PE73).

CAUTION: ENTER THE NEW SYSTEM ACCESS KEY ON THE NK LINE IN INPUT OF THE EXECUTION JCL PROVIDED.

- . Re-initialization of the AE file from the AE0 file supplied for installation.
- . Execution of the new PARM procedure using as backup input the PE file from the parameter retrieval, user code '\*\*\*\*\*', and NRREST as input parameter.
- . Use of the WorkStation: execution of the new PARM procedure. The input should include the transactions associated to the parameters settings for the methodology used (NRCHAR command).

Refer to the paragraph describing the installation of the methodology choices, in Chapter INSTALLATION of your Environment & Installation manual for the current VisualAge Pacbase release shipped with your platform.

Result: AE and AP files containing the 7.3 parameters retrieved in the new format.

2-Retrieval of 7.3 Database(s)

- . 7.3 backup of the database whose output is a 7.3 PC file (7.3 SAVE procedure).
- . Retrieval of the resulting 7.3 backup file, providing a new-format PC file (PC73 procedure).
- . Reorganization (new REOR) of the backup (7.3 PC file in input) whose output is a new-format PC file.
- . Journal file initialization (new ARCH).
- . Database restoration (new REST) (new-format PC file obtained from REOR as input).
- . Backup of 7.3 Generation-Print requests (7.3 SVAG procedure) whose output is a 7.3 PG file.
- . Reorganization-restoration of the Generation-Print request file (new REAG procedure) whose input is the 7.3 PG file.

If libraries, sessions, and/or user codes have been deleted via the database reorganization, the corresponding transactions must be entered for the reorganization of the AG file. Obsolete generation-print requests related to deleted sessions or libraries will be purged. Commands entered by users in 7.3 and cancelled in the new release will also be purged from the AG file.

RESULT: The AJ, AN, AR, and AG files are operational under the new VisualAge Pacbase release.

### 3-Retrieval of a 7.3 Production Environment Interface

- . 7.3 backup of the Production Environment file (7.3 SVPE procedure) whose output is a 7.3 PP file.
- . Retrieval of the resulting 7.3 PP backup file, providing a new-format PP backup file (PP73 procedure).
- . Restoration of Production Environment (new RSPE procedure) whose input is the new-format PP file.

RESULT: The AB and AC files are operational under the new VisualAge Pacbase release.

### 4-Retrieval of a 7.3 Archive Journal in the new format

PJ73 batch procedure.

A procedure for the retrieval of the 7.3 archived journal into a new-format journal is also supplied. It allows for:

- . Journal statistics utility (ACTI)
- . Archived transaction extraction (EXPJ)
- . Retrieval of transactions archived in release 7.3 when running restorations (new REST or RESY with the 'REC' parameter).

For DSMS users who have modified their product code(s) in the new DSMS release, it is possible to perform the same modification in the VisualAge Pacbase journal, via an entry of the PJ73 procedure.

#### 4.6. PJ73 - RETRIEVAL OF ARCHIVE JOURNAL

##### RETRIEVAL OF ARCHIVE JOURNAL

With release 8.0.2 or later of the DSMS Function, it is possible to modify the Product Code when retrieving the previous database. The Code format changes from 1 to 3 characters.

This possibility is also offered when retrieving the PACBASE archived journal from a previous release.

##### USER INPUT (optional)

```
+-----+
! Pos. ! Len. ! Value ! Meaning !
+-----+
!   1  !   4  ! 'onnn'! Modification of DSMS Product Code !
!      !      !      ! o = former Product Code          !
!      !      !      ! nnn = new Product Code           !
!      !      !      ! (1, 2 or 3 characters)          !
+-----+
```

On a line, the 'onnn' character string may be repeated as many times as there are Product Codes to be modified, with a limit of 20.

NOTE: The validity of this input is not checked for proper syntax. The procedure's syntax should be carefully checked before execution, since no output report is produced.

```

## **5. RETRIEVAL OF THE YSM METHODOLOGY**

## 5.1. YSM RETRIEVAL - OPERATIONS TO BE PERFORMED

### YSM METHODOLOGY RETRIEVAL OPERATIONS

Since release 8.0.2 02, PACBASE allows several methodologies to be kept in the same library sub-network. The internal names of the WorkStation YSM entities have been changed specifically for this purpose.

Therefore, it is necessary to retrieve the YSM methodology when receiving the present release, if:

- . 1st case: You have an 8.0.1 PACBASE release; YSM retrieval is then comprised into the 8.0.1 PACBASE retrieval. In this chapter, you need only take into account what refers to the RTYS procedure.
- . 2nd case: You have an 8.0.2 01 PACBASE release and you have to upgrade it to the present WorkStation level.

The following procedure sequence must be run to perform this retrieval:

1. ARCH:  
Creation of a PJ file.
2. SAVE:  
Creation of a PC file.
3. PCYS:  
This first special retrieval procedure operates either on the entire database or on a set of libraries, specified in the procedure's input.

The PC backup resulting of step 1 is the input of the procedure. The resulting output contains a PC(+1) backup and the list of the database libraries which have been modified.

User input is optional. '\*' lines are used to indicate the libraries which contain YSM entities.

When there is no '\*' line, the retrieval is performed on the whole database.

NOTE: if your database contains several methodologies, you must specify the HIGHEST-LEVEL library containing the YSM methodology.

4. REOR

5. REST

6. UPDT

Update from the release DESYSM file.

7. OPTIONAL: Retrieval of the YSM methodology on the archived file:

If necessary, a retrieval of the methodology can be performed on the PJ journal file resulting from the last archiving or from the retrieval. It is the PJYS procedure.

The PJ backup resulting from step 1 and the list of the database libraries modified by PCYS are used as input to the procedure. The resulting output is a PJ(+1) backup.

8. RTYS (RETRIEVAL OF THE AFL ENTITY):

The AFL retrieval is performed only if you request it for a given library and a given session.

The RTYS directly operates on the database by creating update transactions on the \$3V UEOs.

A '\*' line is input for each Library/Session to be processed. It must be submitted once the DESYSM file containing the WorkStation entities for the new release has been loaded.

The PACBASE database is the input of the procedure.

The resulting output is a file which contains update transactions.

## **6. SPECIAL UTILITIES**

## 6.1. INTRODUCTION

### INTRODUCTION

The special utilities, supplied with the Specifications Dictionary function, allow you to perform specific processing in the Database, in order to retrieve your older-version data.

These special utilities are:

TRUV: Conversion of user manual description transactions ('U' entity) into Volume description transaction (PDM - 'V' entity).

TRDQ: Conversion of DB-type DBD blocks into Qx-type SQL blocks in the form of updating transactions.

RMTD: Retrieval of UPDT 8.0.1 transactions in the new format.

## 6.2. *TRUV-CHANGE OF U-ENTITY TRANSACT. INTO V-ENTITIES*

### TRUV: CONVERSION OF USER MANUALS INTO VOLUMES

The TRUV procedure transforms User Manual definition and description lines (resulting from the extraction of the 'U' entity from the database by the PACX-EXTR procedure) into Volume definition and description lines, which in turn can be used as input to the Database Updating (UPDT) procedure.

### EXECUTION CONDITION

None, since the database is not directly updated.

SPECIAL UTILITIES

6

TRUV-CHANGE OF U-ENTITY TRANSACT. INTO V-ENTITIES

2

TRUV-USER INPUT

1

## 6.2.1. TRUV-USER INPUT

TRUV: USER INPUT

One '\*'-line is required:

```

-----
! POS.! LEN.! VALUE ! MEANING !
!-----!
! 2 ! 1 ! '*' ! Line code !
! 3 ! 8 ! !uuuuuuu! User code !
! 11 ! 8 ! !pppppppp! User password !
! 19 ! 3 ! !bbb ! Library code to be extracted !
! 22 ! 4 ! !ssss ! Session number (default=current) !
! 26 ! 1 ! ! ! Session status if frozen session: !
! ! ! ' ' or H! Initial version of frozen session !
! ! ! T ! Test version of frozen session !
!-----!

```

One 'W1' line for each Volume if the user wishes to modify any value retrieved from the User Manual Definition or the default options of the Volume Definition.

(For more details on the Volume Definition, refer to the PERSONALIZED DOCUMENTATION MANAGER Reference Manual).

```

-----
! POS.! LEN.! VALUE ! MEANING !
!-----!
! 2 ! 2 ! 'W1' ! Line code !
! 4 ! 6 ! !xxxxxx ! Code of the Volume to be created !
! ! ! ! (default: code of User Manual) !
! 10 ! 36 ! ! ! Clear name of the Volume (default: !
! ! ! ! clear name of User Manual) !
! 46 ! 1 ! ! ! Type of Volume !
! 47 ! 1 ! ! ! Title Page !
! 48 ! 1 ! ! ! Table of Contents Source !
! 49 ! 1 ! ! ! Table of Contents Placement !
! 50 ! 6 ! ! ! Index Table Text Code !
! 56 ! 3 ! ! ! Report code for print layout !
! 59 ! 3 ! ! ! Report Code for Font Type !
! 62 ! 3 ! ! ! Specific Layout Code !
! 65 ! 3 ! ! ! Internal use only !
!-----!
! 68 ! 3 ! ! ! Code of User Manual to be trans- !
! ! ! ! formed (Required) !
! 70 ! 1 ! '1' ! Generates -TA option (NO justifica- !
! ! ! ! tion) for the Volume !
!-----!

```

	PAGE	53
SPECIAL UTILITIES		6
TRUV-CHANGE OF U-ENTITY TRANSACT. INTO V-ENTITIES		2
TRUV-USER INPUT		1

### RESULT

The result of the TRUV procedure is a sequential file containing the Volume Definition and Description, which can be used as input to the update procedure.

'W1' lines that contain any errors are ignored. The resulting Volume will have the code and clear name of the User Manual, as well as the standard default options of the Volume Definition.

The extracted transactions must not include '\*'-type lines (user identification lines).

## 6.2.2. TRUV-DESCRIPTION OF STEPS

TRANSPOSITION: PTU890

This step transforms 'U' entity transactions into 'V' entity transactions, with possible transcoding showed by the 'W1' input lines.

.Input files:

- 'U' entity transactions  
PAC7MV : DSN=&OLDMAN  
-User input  
PAC7MB : DSN=&&TRUVMB

.Output file:

- 'V' entity transactions for update  
PAC7VM : DSN=&&PAC7MV

### *6.3. TRDQ-CHANGE OF DB DBD BLOCKS INTO SQL BLOCKS*

#### TRDQ: CONVERSION OF DB DBD BLOCKS INTO SQL BLOCKS

The TRDQ utility transforms DB2 database blocks (DB type) into SQL DBD blocks (Qx type).

This procedure extracts the DB-type DBD block entities transformed into Qx-type DBD SQL block entities in the form of transactions, which in turn will be used as input to the Database Update (UPDT) procedure.

#### EXECUTION CONDITION

None, since the database is not directly updated.

Batch procedure access authorization option:  
Level 2 is required.

SPECIAL UTILITIES

6

TRDQ-CHANGE OF DB DBD BLOCKS INTO SQL BLOCKS

3

TRDQ-USER INPUT

1

## 6.3.1. TRDQ-USER INPUT

TRDQ: USER INPUT

One '\*' line is required for each library containing the DB- type DBD block(s) to be transformed:

```

-----
! POS.! LEN.! VALUE ! MEANING !
!-----!
! 1 ! 1 ! 'C' ! The '*' line will be transferred to !
! ! ! ! the beginning of generated transac- !
! ! ! ! tions (note that the password is !
! ! ! ! NOT transferred) !
! ! ! ! The '*' line will not be transferred!
! 2 ! 1 ! '*' ! Line code !
! 3 ! 8 ! !uuuuuuuu! User code !
! 11 ! 8 ! !pppppppp! User password !
! 19 ! 3 ! !bbb ! Library code to extract !
! 22 ! 4 ! !ssss ! Session number (default=current) !
! 26 ! 1 ! ! ! Session status if frozen session: !
! ! ! ! ' ' or H! Initial version of frozen session !
! ! ! ! T ! Test version of frozen session !
!-----!

```

One command line per DB-type DBD block to transform into Qx-type SQL block:

```

-----
! POS.! LEN.! VALUE ! MEANING !
!-----!
! 2 ! 2 ! 'W1' ! Line code !
! 4 ! 1 ! ! ! Library selection code: !
! ! ! ! 'U' ! Selected library only !
! ! ! ! 'C' ! Selected library and higher-level !
! ! ! ! ! libraries !
! 5 ! 6 ! !bbbbbb ! PACBASE code of the DB-type block to !
! ! ! ! ! transform !
! 11 ! 6 ! !qqqqqq ! PACBASE code of the resulting !
! ! ! ! ! Qx-type block !
! ! ! ! ! THIS NEW CODE MUST BE DIFFERENT !
! ! ! ! ! FROM ANY EXISTING BLOCK CODE !
! Optional modifications for the resulting Qx-type block: !
! 17 ! 8 ! !eeeeeeee! External name !
! 25 ! 1 ! ! x ! Control card in front of block !
! 26 ! 1 ! ! y ! Control card in back of block !
! 27 ! 36 ! ! nn.... ! Block name !
! 63 ! 2 ! ! Qx ! Block type (Q2,QR,QO,QT, etc.) <Q2>!
!-----!

```

SPECIAL UTILITIES

TRDQ-CHANGE OF DB DBD BLOCKS INTO SQL BLOCKS  
TRDQ-USER INPUT

PAGE

58

6  
3  
1

PRINTED OUTPUT

This procedure prints out a selection report with an indication of possible errors.

RESULT

The result of the TRDQ procedure is a sequential file containing the transformed Qx block transactions, which will be used as input to the UPDT procedure.

NOTE: The TRDQ procedure must be followed by the RMEN procedure which creates cross-references for new blocks. L1-, L2-, L3- or V3-type lines should then be deleted from the RMEN output file. The utility UPDT requires as input the concatenation of TRDQ and RMEN transactions in that order.

## 6.3.2. TRDQ-DESCRIPTION OF STEPS

TRANSFORMATION OF BLOCKS: PTUDQ2

This step extracts the DB DBD transactions transformed into SQL Q2 blocks according to the user input:

## .Permanent input files:

-Data file

PAC7AR : &amp;INDUV..&amp;ROOT.&amp;FILE.AR

-Index file

PAC7AN : DSN=&amp;INDUV..&amp;ROOT.&amp;FILE.AN

-Error message file

PAC7AE : DSN=&amp;INDSV..&amp;ROOT.&amp;ROOT.AE

## .Transactions file:

-User input

PAC7MB : DSN=&amp;&amp;TRDQMB

## .Output file:

-Transformed transactions

PAC7MV : DSN=&amp;&amp;MB

## .Output report:

-Batch procedure authorization option

PAC7DD

## .Return codes:

-8: No authorization on the batch procedure.

MIGRATION OF A VISUALAGE PACBASE DATABASE  
OVERVIEW OF THE MIGRATION PROCESS

PAGE

7  
1

64

## **7. MIGRATION OF A VISUALAGE PACBASE DATABASE**

## 7.1. OVERVIEW OF THE MIGRATION PROCESS

### MIGRATION OF A VA PAC DATABASE ONTO A LOCAL NETWORK

This chapter describes the operations which are specific to the migration of a VA Pac database onto another platform.

Examples:

- Migration of an IBM/MVS platform onto an OS/2, Unix or Windows/NT platform,
- Migration of an OS/2 platform onto a Unix or Windows/NT platform.

The operations include three steps:

- On the source platform, constitution of all the sequential backups which make up the database, plus possible processing of these files to ensure their correct transfer and retrieval on the target platform.
- Transfer of the sequential files onto the target platform.
- On the target platform, retrieval of all the sequential files to adapt them to the new installation technical characteristics, and then restoration of the files which make up the VA Pac database on the target platform.

Refer to Chapter RESTORING FILES ON THE TARGET PLATFORM in the Operations Manual - PART I (Environment & Installation) for each of these platforms.

## *7.2. BUILDING OF FILES ON THE SOURCE PLATFORM*

### BUILDING OF FILES ON THE SOURCE PLATFORM

The user may refer to the BATCH PROCEDURES Operations manuals corresponding to the source platform for the description of the procedures presented below.

#### User Parameter Backup

- . Execution of the PARM procedure, whose output is a user parameter PE backup file.
- . Decryption of user passwords by the execution of the CRYP procedure, using the 'DECODE' parameter in input.

#### Database Backup

- . Execution of the ARCH procedure, whose output is a PJ archived transaction file.
- . Execution of the SAVE procedure, whose output is a PC database backup file.
- . For a correct transfer of the backup, replacement of low-value by blanks in the PC file by the execution of the LVBL procedure.

#### Generation-Print Request Backup

- . Execution of the SVAG procedure, whose output is a PG backup file of generation-print requests.

#### Production Environment Backup

- . For users equipped with a PEI function, execution of the SVPE procedure, whose output is a production environment PP backup file.

### Pactables backup

For users equipped with a Pactables function, two cases are possible:

- . Pactables migrates onto the target platform: execution of the SVTA procedure, whose output is a TC backup file of table content and descriptions, as well as user parameters.
  
- . Pactables remains on the source platform: in this case only the TD table description file must be present on the new development platform. Execution of the SMTD procedure, whose output is a PD backup file of table descriptions, and retrieval of this file, if necessary, to adapt it to the format of the new release.

The user may refer to the Pactables Function Operations manual to see if it is necessary to retrieve the TD file.

### *7.3. TRANSFER OF FILES*

#### TRANSFER OF FILES TO THE LOCAL NETWORK

The transfer software to be used varies according to the platform. The sequential files to be transferred are output by the previous steps, i.e.:

- . PE user parameter backup,
- . PC database backup,
- . PG generation-print request backup.

And possibly:

- . PJ archived journal, if the user wants to retrieve it on the target platform,
- . PP production environment backup,
- . backup of TD table descriptions.

	PAGE	69
MIGRATION OF A VISUALAGE PACBASE DATABASE		7
TRANSFER OF FILES		3
TRANSFER FROM HOST TO LOCAL WORK STATION		1

### 7.3.1. TRANSFER FROM HOST TO LOCAL WORK STATION

#### TRANSFER OF FILES TO THE LOCAL AREA NETWORK

These transfers can be performed with the standard software installed with the communication manager and supplied in the OS/2 extended releases.

Other software can also be used.

The parameters which must be indicated for the transfer are the following:

- . The files to be transferred are data files (DATA).
- . The files must be converted into ASCII format.
- . The files must contain the control characters for the record ends (generally, the parameter to specify is CRLF).

	PAGE	70
MIGRATION OF A VISUALAGE PACBASE DATABASE		7
TRANSFER OF FILES		3
TRANSFER FROM LOCAL WORK STATION TO HOST		2

### 7.3.2. TRANSFER FROM LOCAL WORK STATION TO HOST

#### TRANSFER OF FILES FROM THE LOCAL STATION TO THE HOST

This transfer may be done using the standard software provided with the emulator.

Other software may also be used.

The parameters which should be specified for the transfer are the following:

- . Files to be transfered are data files (DATA).
- . The files must be converted to the format of the target platform (ASCII for GCOS8, UNISYS-1100,... and EBCDIC for MVS, GCOS7,...).
- . The files must contain check characters for end-of-records. (Typically, the parameter to be specified is CRLF.)
- . Special care should be given to the format of the receiving file. Indeed, on 'micro' (PC) platforms, files are true variables. If a file is transfered as is, the COBOL program will not handle it correctly, and the rebuilt database will result in an inconsistant state.

Therefore, the transfer file must be defined in a fixed-length format of 149 characters. Then, via an utility, copy this file in the reorganization input format (PC).

MIGRATION OF A VISUALAGE PACBASE DATABASE		7
TRANSFER OF FILES		3
TRANSFER FROM HOST TO HOST		3

### 7.3.3. TRANSFER FROM HOST TO HOST

#### TRANSFER OF FILES FROM HOST TO HOST

Whatever the 'source' and 'target' platform types, it is recommended to transfer the files using tapes in the IBM-format, this format being recognized by virtually all materials.

## *7.4. FILE RESTORATION ON THE TARGET (LOCAL) PLATFORM*

### RESTORING FILES ON THE TARGET PLATFORM

#### PHYSICAL ORGANIZATION OF FILES

All the VA Pac indexed sequential files on OS/2, UNIX and Windows NT releases are physically managed according to the ASCII sequence. These are the AE, AP and AG, AB, AC files for the PEI function and TD for the Pactables interface. The sequential backups of all these files will then be sorted according to an ASCII sequence during the database migration onto VA Pac.

#### SOURCE PLATFORM RELEASE

If the source platform release is identical to that of the target platform, the retrieval of the sequential backups will essentially consist in the conversion of these files into the OS/2 ASCII format of the target platform.

If the source platform release is older than the target platform release, but newer or equal to the 8.02v02 release, the PJ16 and PP16 procedures should be applied before the above mentioned steps. (See Chapter 'RETRIEVAL OF PACBASE 802v02,... 2.0' in your Environment & Installation manual for details on these procedures.)

If the source platform release is anterior to 8.02v02, contact VisualAge Pacbase Support to work out the best solution.

The procedures presented below are described in Chapter 'MIGRATIONS' of the 'Batch Procedures: Administrator's Guide'.

## OPERATIONS TO BE PERFORMED

### 1. User Parameter Restoration

- . Retrieval of the PE backup in ASCII format: PEAS procedure.
- . Encryption of user passwords (these were decrypted before the transfer of PE file) by the CRYP procedure with 'CODE' parameter.
- . Restoration of the AE and AP files via the running of the LOAE procedure, which uses in input:
  - The backup (PE file) output from the CRYP procedure,
  - The AE0 file supplied for the installation,
  - The MBLOAE transaction file containing the NRREST command.

RESULT: The AE and AP files containing the source installation user parameters which are operational on the new platform.

### 2. Database Restoration

- . Reorganization (REOR procedure) of the PC backup, output from the PC73 or PC80 retrieval, or directly output from the file transfer.
- . Initialization of journal file (ARCH procedure) if the AJ file already exists in the 'JOURNAL' directory of the database to be installed.
- . Restoration of the database (REST procedure) using the PC backup output produced by the reorganization. Before executing the restoration, make sure that the input transaction (MBREST) is correct.

RESULT: The AR, AN and AJ files are operational on the new platform.

### 3. Restoration of generation-print requests

- . Sort of the PG backup in ASCII format: PGAS procedure (all releases of the source site).
- . Reorganization-restoration of generation-print requests (REAG) using the PG backup obtained in the previous step as input. Before executing this restoration, make sure that the input transaction (MBREAG) includes 'AG'.

If libraries, sessions, and/or user codes have been deleted via the database reorganization, the corresponding transactions must be entered for the reorganization of the AG file. Obsolete generation-print requests related to deleted sessions or libraries will be purged.

RESULT: The AG file is operational on the new platform.

### 4. PEI: Production Environment Restoration

- . Retrieval of PP backup in the ASCII format: PPAS.
- . Restoration of the production environment (RSPE) using the PP backup obtained in the previous step as input.

RESULT: The AB and AC files are operational on the new platform.

### 5. Pactables: Restoration of Table Descriptions

Only the migration of the table descriptions file (TD) is explained here. Besides, the retrieval of this file in the format of the new release may be performed on the site where the Pactables function operates. The transferred PD backup file is then already in the format of the new release:

- . Retrieval of PD backup in the ASCII format: TD80 procedure.
- . Restoration of table descriptions (RMTD) using the backup obtained in the previous step as input.

RESULT: The TD file is operational on the new platform.

## *7.5. CRYP - CODING-DECODING OF PASSWORDS*

### CRYP: INTRODUCTION

The CRYP procedure performs the encryption and decryption of user passwords in the PE user-parameter backup file.

The objective of this procedure is to transfer the PE file onto platforms with different codings.

### EXECUTION CONDITION

Authorization level '4' for the update of user parameters (PARM).

### 7.5.1. CRYP - USER INPUT

#### CRYP: USER INPUT

A '\*' line with the user code and the password must be entered.

The user code specified on the '\*' line must exist in the PE file to be processed.

The procedure's specific user input allows for the selection of either Encryption or Decryption.

!Pos.	! Len.	! Value	! Meaning
! 3	! 6	! 'CODE'	! Password encryption
!	!	! 'DECODE'	! Password decryption

NOTE: When decrypting, the backup obtained must not be reloaded via the 'PARM' procedure. If it were, user passwords would no longer be recognized.

## *7.6. LVBL - CHANGE OF LOW-VALUE CHARACTERS INTO BLANKS*

### LVBL: INTRODUCTION

The LVBL procedure inserts a blank wherever a low-value is present in the PC Database backup file.

The purpose of this procedure is to transfer the PC file onto different platforms while avoiding problems due to the presence of low-values at the time of transfer.

### UTILIZATION OPTION

The LVBL procedure allows you to keep only records of the 'data' type. See the 'Description of Steps' section (Sub-chapter dedicated to LVBL in the Administrator's Guide) for further details on the implementation of this option.

### EXECUTION CONDITION

None
